In addition, any transactions which are detectably dependent on a conflicting transaction are also regarded as being in conflict, these dependencies being determined by the contents of the secondary cluster’s binary log. Since the binary log contains only data modification operations (inserts, updates, and deletes), only overlapping data modifications are used to determine dependencies between transactions.

`NDB$EPOCH_TRANS()` is subject to the same conditions and limitations as `NDB$EPOCH()`, and in addition requires that all transaction IDs are recorded in the secondary’s binary log, using `--ndb-log-transaction-id` set to `ON`. This adds a variable amount of overhead (up to 13 bytes per row).

See [NDB\\$EPOCH\(\)](#).

## NDB\$EPOCH2()

The `NDB$EPOCH2()` function is similar to `NDB$EPOCH()`, except that `NDB$EPOCH2()` provides for delete-delete handling with a bidirectional replication topology. In this scenario, primary and secondary roles are assigned to the two sources by setting the `ndb_conflict_role` system variable to the appropriate value on each source (usually one each of `PRIMARY`, `SECONDARY`). When this is done, modifications made by the secondary are reflected by the primary back to the secondary which then conditionally applies them.

## NDB\$EPOCH2\_TRANS()

`NDB$EPOCH2_TRANS()` extends the `NDB$EPOCH2()` function. Conflicts are detected and handled in the same way, and assigning primary and secondary roles to the replicating clusters, but with the extra condition that any other rows updated in the same transaction in which the conflict occurred are also regarded as being in conflict. That is, `NDB$EPOCH2()` realigns individual conflicting rows on the secondary, while `NDB$EPOCH_TRANS()` realigns conflicting transactions.

Where `NDB$EPOCH()` and `NDB$EPOCH_TRANS()` use metadata that is specified per row, per last modified epoch, to determine on the primary whether an incoming replicated row change from the secondary is concurrent with a locally committed change; concurrent changes are regarded as conflicting, with subsequent exceptions table updates and realignment of the secondary. A problem arises when a row is deleted on the primary so there is no longer any last-modified epoch available to determine whether any replicated operations conflict, which means that conflicting delete operations are not detected. This can result in divergence, an example being a delete on one cluster which is concurrent with a delete and insert on the other; this why delete operations can be routed to only one cluster when using `NDB$EPOCH()` and `NDB$EPOCH_TRANS()`.

`NDB$EPOCH2()` bypasses the issue just described—storing information about deleted rows on the PRIMARY—by ignoring any delete-delete conflict, and by avoiding any potential resultant divergence as well. This is accomplished by reflecting any operation successfully applied on and replicated from the secondary back to the secondary. On its return to the secondary, it can be used to reapply an operation on the secondary which was deleted by an operation originating from the primary.

When using `NDB$EPOCH2()`, you should keep in mind that the secondary applies the delete from the primary, removing the new row until it is restored by a reflected operation. In theory, the subsequent insert or update on the secondary conflicts with the delete from the primary, but in this case, we choose to ignore this and allow the secondary to “win”, in the interest of preventing divergence between the clusters. In other words, after a delete, the primary does not detect conflicts, and instead adopts the secondary’s following changes immediately. Because of this, the secondary’s state can revisit multiple previous committed states as it progresses to a final (stable) state, and some of these may be visible.

You should also be aware that reflecting all operations from the secondary back to the primary increases the size of the primary’s logbinary log, as well as demands on bandwidth, CPU usage, and disk I/O.

Application of reflected operations on the secondary depends on the state of the target row on the secondary. Whether or not reflected changes are applied on the secondary can be tracked by checking the `Ndb_conflict_reflected_op_prepare_count` and `Ndb_conflict_reflected_op_discard_count` status variables. The number of changes applied is simply the difference between these two values (note that `Ndb_conflict_reflected_op_prepare_count` is always greater than or equal to `Ndb_conflict_reflected_op_discard_count`).

Events are applied if and only if both of the following conditions are true:

- The existence of the row—that is, whether or not it exists—is in accordance with the type of event. For delete and update operations, the row must already exist. For insert operations, the row must *not* exist.
- The row was last modified by the primary. It is possible that the modification was accomplished through the execution of a reflected operation.

If both of these conditions are not met, the reflected operation is discarded by the secondary.

## Conflict Resolution Exceptions Table

To use the `NDB$OLD()` conflict resolution function, it is also necessary to create an exceptions table corresponding to each `NDB` table for which this type of conflict resolution is to be employed. This is also true when using `NDB$EPOCH()` or `NDB$EPOCH_TRANS()`. The name of this table is that of the table for which conflict resolution is to be applied, with the string `$EX` appended. (For example, if the name of the original table is `mytable`, the name of the corresponding exceptions table name should be `mytable$EX`.) The syntax for creating the exceptions table is as shown here:

```
CREATE TABLE original_table$EX (
 [NDB$]server_id INT UNSIGNED,
 [NDB$]source_server_id INT UNSIGNED,
 [NDB$]source_epoch BIGINT UNSIGNED,
 [NDB$]count INT UNSIGNED,

 [NDB$OP_TYPE ENUM('WRITE_ROW', 'UPDATE_ROW', 'DELETE_ROW',
 'REFRESH_ROW', 'READ_ROW') NOT NULL,]
 [NDB$CFT_CAUSE ENUM('ROW_DOES_NOT_EXIST', 'ROW_ALREADY_EXISTS',
 'DATA_IN_CONFLICT', 'TRANS_IN_CONFLICT') NOT NULL,]
 [NDB$ORIG_TRANSID BIGINT UNSIGNED NOT NULL,]

 original_table_pk_columns,

 [orig_table_column | orig_table_column$OLD | orig_table_column$NEW,]

 [additional_columns,]

 PRIMARY KEY([NDB$]server_id, [NDB$]source_server_id, [NDB$]source_epoch, [NDB$]count)
) ENGINE=NDB;
```

The first four columns are required. The names of the first four columns and the columns matching the original table's primary key columns are not critical; however, we suggest for reasons of clarity and consistency, that you use the names shown here for the `server_id`, `source_server_id`, `source_epoch`, and `count` columns, and that you use the same names as in the original table for the columns matching those in the original table's primary key.

If the exceptions table uses one or more of the optional columns `NDB$OP_TYPE`, `NDB$CFT_CAUSE`, or `NDB$ORIG_TRANSID` discussed later in this section, then each of the required columns must also be named using the prefix `NDB$`. If desired, you can use the `NDB$` prefix to name the required columns even if you do not define any optional columns, but in this case, all four of the required columns must be named using the prefix.

Following these columns, the columns making up the original table's primary key should be copied in the order in which they are used to define the primary key of the original table. The data types for the columns duplicating the primary key columns of the original table should be the same as (or larger than) those of the original columns. A subset of the primary key columns may be used.

The exceptions table must use the `NDB` storage engine. (An example that uses `NDB$OLD()` with an exceptions table is shown later in this section.)

Additional columns may optionally be defined following the copied primary key columns, but not before any of them; any such extra columns cannot be `NOT NULL`. NDB Cluster supports three additional, predefined optional columns `NDB$OP_TYPE`, `NDB$CFT_CAUSE`, and `NDB$ORIG_TRANSID`, which are described in the next few paragraphs.

**`NDB$OP_TYPE`:** This column can be used to obtain the type of operation causing the conflict. If you use this column, define it as shown here:

```
NDB$OP_TYPE ENUM('WRITE_ROW', 'UPDATE_ROW', 'DELETE_ROW',
 'REFRESH_ROW', 'READ_ROW') NOT NULL
```

The `WRITE_ROW`, `UPDATE_ROW`, and `DELETE_ROW` operation types represent user-initiated operations. `REFRESH_ROW` operations are operations generated by conflict resolution in compensating transactions

sent back to the originating cluster from the cluster that detected the conflict. `READ_ROW` operations are user-initiated read tracking operations defined with exclusive row locks.

`NDB$CFT_CAUSE`: You can define an optional column `NDB$CFT_CAUSE` which provides the cause of the registered conflict. This column, if used, is defined as shown here:

```
NDB$CFT_CAUSE ENUM('ROW_DOES_NOT_EXIST', 'ROW_ALREADY_EXISTS',
'DATA_IN_CONFLICT', 'TRANS_IN_CONFLICT') NOT NULL
```

`ROW_DOES_NOT_EXIST` can be reported as the cause for `UPDATE_ROW` and `WRITE_ROW` operations; `ROW_ALREADY_EXISTS` can be reported for `WRITE_ROW` events. `DATA_IN_CONFLICT` is reported when a row-based conflict function detects a conflict; `TRANS_IN_CONFLICT` is reported when a transactional conflict function rejects all of the operations belonging to a complete transaction.

`NDB$ORIG_TRANSID`: The `NDB$ORIG_TRANSID` column, if used, contains the ID of the originating transaction. This column should be defined as follows:

```
NDB$ORIG_TRANSID BIGINT UNSIGNED NOT NULL
```

`NDB$ORIG_TRANSID` is a 64-bit value generated by `NDB`. This value can be used to correlate multiple exceptions table entries belonging to the same conflicting transaction from the same or different exceptions tables.

Additional reference columns which are not part of the original table's primary key can be named `colname$OLD` or `colname$NEW`. `colname$OLD` references old values in update and delete operations—that is, operations containing `DELETE_ROW` events. `colname$NEW` can be used to reference new values in insert and update operations—in other words, operations using `WRITE_ROW` events, `UPDATE_ROW` events, or both types of events. Where a conflicting operation does not supply a value for a given reference column that is not a primary key, the exceptions table row contains either `NULL`, or a defined default value for that column.

### Important

The `mysql.ndb_replication` table is read when a data table is set up for replication, so the row corresponding to a table to be replicated must be inserted into `mysql.ndb_replication` before the table to be replicated is created.

## Conflict Detection Status Variables

Several status variables can be used to monitor conflict detection. You can see how many rows have been found in conflict by `NDB$EPOCH()` since this replica was last restarted from the current value of the `Ndb_conflict_fn_epoch` system status variable.

`Ndb_conflict_fn_epoch_trans` provides the number of rows that have been found directly in conflict by `NDB$EPOCH_TRANS()`. `Ndb_conflict_fn_epoch2` and `Ndb_conflict_fn_epoch2_trans` show the number of rows found in conflict by `NDB$EPOCH2()` and `NDB$EPOCH2_TRANS()`, respectively. The number of rows actually realigned, including those affected due to their membership in or dependency on the same transactions as other conflicting rows, is given by `Ndb_conflict_trans_row_reject_count`.

Another server status variable `Ndb_conflict_fn_max` provides a count of the number of times that a row was not applied on the current SQL node due to “greatest timestamp wins” conflict resolution since the last time that `mysqld` was started. `Ndb_conflict_fn_max_del_win` provides a count of the number of times that conflict resolution based on the outcome of `NDB$MAX_DELETE_WIN()` has been applied.

`Ndb_conflict_fn_max_ins` tracks the number of times that “greater timestamp wins” handling has been applied to write operations (using `NDB$MAX_INS()`); a count of the number of times that “same timestamp wins” handling of writes has been applied (as implemented by `NDB$MAX_DEL_INS()`), is provided by the status variable `Ndb_conflict_fn_max_del_win_ins`.

The number of times that a row was not applied as the result of “same timestamp wins” conflict resolution on a given `mysqld` since the last time it was restarted is given by the global status variable `Ndb_conflict_fn_old`. In addition to incrementing `Ndb_conflict_fn_old`, the primary key of the row that was not used is inserted into an *exceptions table*, as explained elsewhere in this section.

See also [NDB Cluster Status Variables](#).

## Examples

The following examples assume that you have already a working NDB Cluster replication setup, as described in [Section 25.7.5, “Preparing the NDB Cluster for Replication”](#), and [Section 25.7.6, “Starting NDB Cluster Replication \(Single Replication Channel\)”](#).

**NDB\$MAX() example.** Suppose you wish to enable “greatest timestamp wins” conflict resolution on table `test.t1`, using column `mycol` as the “timestamp”. This can be done using the following steps:

1. Make sure that you have started the source `mysqld` with `--ndb-log-update-as-write=OFF`.
2. On the source, perform this `INSERT` statement:

```
INSERT INTO mysql.ndb_replication
VALUES ('test', 't1', 0, NULL, 'NDB$MAX(mycol)');
```

### Note

If the `ndb_replication` table does not already exist, you must create it. See [ndb\\_replication Table](#).

Inserting a 0 into the `server_id` column indicates that all SQL nodes accessing this table should use conflict resolution. If you want to use conflict resolution on a specific `mysqld` only, use the actual server ID.

Inserting `NULL` into the `binlog_type` column has the same effect as inserting 0 (`NBT_DEFAULT`); the server default is used.

3. Create the `test.t1` table:

```
CREATE TABLE test.t1 (
 columns
 mycol INT UNSIGNED,
 columns
) ENGINE=NDB;
```

Now, when updates are performed on this table, conflict resolution is applied, and the version of the row having the greatest value for `mycol` is written to the replica.

### Note

Other `binlog_type` options such as `NBT_UPDATED_ONLY_USE_UPDATE` (6) should be used to control logging on the source using the `ndb_replication` table rather than by using command-line options.

**NDB\$OLD() example.** Suppose an `NDB` table such as the one defined here is being replicated, and you wish to enable “same timestamp wins” conflict resolution for updates to this table:

```
CREATE TABLE test.t2 (
 a INT UNSIGNED NOT NULL,
 b CHAR(25) NOT NULL,
 columns,
 mycol INT UNSIGNED NOT NULL,
 columns,
 PRIMARY KEY pk (a, b)
) ENGINE=NDB;
```

The following steps are required, in the order shown:

- First—and *prior* to creating `test.t2`—you must insert a row into the `mysql.ndb_replication` table, as shown here:

```
INSERT INTO mysql.ndb_replication
VALUES ('test', 't2', 0, 0, 'NDB$OLD(mycol)');
```

Possible values for the `binlog_type` column are shown earlier in this section; in this case, we use `0` to specify that the server default logging behavior be used. The value '`NDB$OLD(mycol)`' should be inserted into the `conflict_fn` column.

- Create an appropriate exceptions table for `test.t2`. The table creation statement shown here includes all required columns; any additional columns must be declared following these columns, and before the definition of the table's primary key.

```
CREATE TABLE test.t2$EX (
 server_id INT UNSIGNED,
 source_server_id INT UNSIGNED,
 source_epoch BIGINT UNSIGNED,
 count INT UNSIGNED,
 a INT UNSIGNED NOT NULL,
 b CHAR(25) NOT NULL,
 [additional_columns,]
)
PRIMARY KEY(server_id, source_server_id, source_epoch, count)
) ENGINE=NDB;
```

We can include additional columns for information about the type, cause, and originating transaction ID for a given conflict. We are also not required to supply matching columns for all primary key columns in the original table. This means you can create the exceptions table like this:

```
CREATE TABLE test.t2$EX (
 NDB$server_id INT UNSIGNED,
 NDB$source_server_id INT UNSIGNED,
 NDB$source_epoch BIGINT UNSIGNED,
 NDB$count INT UNSIGNED,
 a INT UNSIGNED NOT NULL,
 NDB$OP_TYPE ENUM('WRITE_ROW', 'UPDATE_ROW', 'DELETE_ROW',
 'REFRESH_ROW', 'READ_ROW') NOT NULL,
 NDB$CFT_CAUSE ENUM('ROW_DOES_NOT_EXIST', 'ROW_ALREADY_EXISTS',
 'DATA_IN_CONFLICT', 'TRANS_IN_CONFLICT') NOT NULL,
 NDB$ORIG_TRANSID BIGINT UNSIGNED NOT NULL,
 [additional_columns,]
)
PRIMARY KEY(NDB$server_id, NDB$source_server_id, NDB$source_epoch, NDB$count)
) ENGINE=NDB;
```

### Note

The `NDB$` prefix is required for the four required columns since we included at least one of the columns `NDB$OP_TYPE`, `NDB$CFT_CAUSE`, or `NDB$ORIG_TRANSID` in the table definition.

- Create the table `test.t2` as shown previously.

These steps must be followed for every table for which you wish to perform conflict resolution using `NDB$OLD()`. For each such table, there must be a corresponding row in `mysql.ndb_replication`, and there must be an exceptions table in the same database as the table being replicated.

**Read conflict detection and resolution.** NDB Cluster also supports tracking of read operations, which makes it possible in circular replication setups to manage conflicts between reads of a given row in one cluster and updates or deletes of the same row in another. This example uses `employee` and `department` tables to model a scenario in which an employee is moved from one department to another on the source cluster (which we refer to hereafter as cluster A) while the replica cluster

(hereafter *B*) updates the employee count of the employee's former department in an interleaved transaction.

The data tables have been created using the following SQL statements:

```
Employee table
CREATE TABLE employee (
 id INT PRIMARY KEY,
 name VARCHAR(2000),
 dept INT NOT NULL
) ENGINE=NDB;

Department table
CREATE TABLE department (
 id INT PRIMARY KEY,
 name VARCHAR(2000),
 members INT
) ENGINE=NDB;
```

The contents of the two tables include the rows shown in the (partial) output of the following `SELECT` statements:

```
mysql> SELECT id, name, dept FROM employee;
+-----+-----+
| id | name | dept |
+-----+-----+
...
| 998 | Mike | 3 |
| 999 | Joe | 3 |
| 1000 | Mary | 3 |
...
+-----+-----+
mysql> SELECT id, name, members FROM department;
+-----+-----+-----+
| id | name | members |
+-----+-----+-----+
...
| 3 | Old project | 24 |
...
+-----+-----+-----+
```

We assume that we are already using an exceptions table that includes the four required columns (and these are used for this table's primary key), the optional columns for operation type and cause, and the original table's primary key column, created using the SQL statement shown here:

```
CREATE TABLE employee$EX (
 NDB$server_id INT UNSIGNED,
 NDB$source_server_id INT UNSIGNED,
 NDB$source_epoch BIGINT UNSIGNED,
 NDB$count INT UNSIGNED,

 NDB$OP_TYPE ENUM('WRITE_ROW', 'UPDATE_ROW', 'DELETE_ROW',
 'REFRESH_ROW', 'READ_ROW') NOT NULL,
 NDB$CFT_CAUSE ENUM('ROW_DOES_NOT_EXIST',
 'ROW_ALREADY_EXISTS',
 'DATA_IN_CONFLICT',
 'TRANS_IN_CONFLICT') NOT NULL,

 id INT NOT NULL,
 PRIMARY KEY(NDB$server_id, NDB$source_server_id, NDB$source_epoch, NDB$count)
) ENGINE=NDB;
```

Suppose there occur the two simultaneous transactions on the two clusters. On cluster *A*, we create a new department, then move employee number 999 into that department, using the following SQL statements:

```
BEGIN;
 INSERT INTO department VALUES (4, "New project", 1);
```

```
UPDATE employee SET dept = 4 WHERE id = 999;
COMMIT;
```

At the same time, on cluster *B*, another transaction reads from `employee`, as shown here:

```
BEGIN;
 SELECT name FROM employee WHERE id = 999;
 UPDATE department SET members = members - 1 WHERE id = 3;
commit;
```

The conflicting transactions are not normally detected by the conflict resolution mechanism, since the conflict is between a read (`SELECT`) and an update operation. You can circumvent this issue by executing `SET ndb_log_exclusive_reads = 1` on the replica cluster. Acquiring exclusive read locks in this way causes any rows read on the source to be flagged as needing conflict resolution on the replica cluster. If we enable exclusive reads in this way prior to the logging of these transactions, the read on cluster *B* is tracked and sent to cluster *A* for resolution; the conflict on the `employee` row is subsequently detected and the transaction on cluster *B* is aborted.

The conflict is registered in the exceptions table (on cluster *A*) as a `READ_ROW` operation (see [Conflict Resolution Exceptions Table](#), for a description of operation types), as shown here:

```
mysql> SELECT id, NDBOP_TYPE, NDBCFT_CAUSE FROM employee$EX;
+-----+-----+-----+
| id | NDB$OP_TYPE | NDB$CFT_CAUSE |
+-----+-----+-----+
...
| 999 | READ_ROW | TRANS_IN_CONFLICT |
+-----+-----+-----+
```

Any existing rows found in the read operation are flagged. This means that multiple rows resulting from the same conflict may be logged in the exception table, as shown by examining the effects a conflict between an update on cluster *A* and a read of multiple rows on cluster *B* from the same table in simultaneous transactions. The transaction executed on cluster *A* is shown here:

```
BEGIN;
 INSERT INTO department VALUES (4, "New project", 0);
 UPDATE employee SET dept = 4 WHERE dept = 3;
 SELECT COUNT(*) INTO @count FROM employee WHERE dept = 4;
 UPDATE department SET members = @count WHERE id = 4;
COMMIT;
```

Concurrently a transaction containing the statements shown here runs on cluster *B*:

```
SET ndb_log_exclusive_reads = 1; # Must be set if not already enabled
...
BEGIN;
 SELECT COUNT(*) INTO @count FROM employee WHERE dept = 3 FOR UPDATE;
 UPDATE department SET members = @count WHERE id = 3;
COMMIT;
```

In this case, all three rows matching the `WHERE` condition in the second transaction's `SELECT` are read, and are thus flagged in the exceptions table, as shown here:

```
mysql> SELECT id, NDBOP_TYPE, NDBCFT_CAUSE FROM employee$EX;
+-----+-----+-----+
| id | NDB$OP_TYPE | NDB$CFT_CAUSE |
+-----+-----+-----+
...
| 998 | READ_ROW | TRANS_IN_CONFLICT |
| 999 | READ_ROW | TRANS_IN_CONFLICT |
| 1000 | READ_ROW | TRANS_IN_CONFLICT |
...
+-----+-----+-----+
```

Read tracking is performed on the basis of existing rows only. A read based on a given condition track conflicts only of any rows that are *found* and not of any rows that are inserted in an interleaved

transaction. This is similar to how exclusive row locking is performed in a single instance of NDB Cluster.

**Insert conflict detection and resolution example.** The following example illustrates the use of insert conflict detection functions. We assume that we are replicating two tables `t1` and `t2` in database `test`, and that we wish to use insert conflict detection with `NDB$MAX_INS()` for `t1` and `NDB$MAX_DEL_WIN_INS()` for `t2`. The two data tables are not created until later in the setup process.

Setting up insert conflict resolution is similar to setting up other conflict detection and resolution algorithms as shown in the previous examples. If the `mysql.ndb_replication` table used to configure binary logging and conflict resolution, does not already exist, it is first necessary to create it, as shown here:

```
CREATE TABLE mysql.ndb_replication (
 db VARBINARY(63),
 table_name VARBINARY(63),
 server_id INT UNSIGNED,
 binlog_type INT UNSIGNED,
 conflict_fn VARBINARY(128),
 PRIMARY KEY USING HASH (db, table_name, server_id)
) ENGINE=NDB
PARTITION BY KEY(db,table_name);
```

The `ndb_replication` table acts on a per-table basis; that is, we need to insert a row containing table information, a `binlog_type` value, the conflict resolution function to be employed, and the name of the timestamp column (`X`) for each table to be set up, like this:

```
INSERT INTO mysql.ndb_replication VALUES ("test", "t1", 0, 7, "NDB$MAX_INS(X)");
INSERT INTO mysql.ndb_replication VALUES ("test", "t2", 0, 7, "NDB$MAX_DEL_WIN_INS(X));
```

Here we have set the `binlog_type` as `NBT_FULL_USE_UPDATE` (7) which means that full rows are always logged. See [ndb\\_replication Table](#), for other possible values.

You can also create an exceptions table corresponding to each NDB table for which conflict resolution is to be employed. An exceptions table records all rows rejected by the conflict resolution function for a given table. Exceptions tables for replication conflict detection for tables `t1` and `t2` can be created using the following two SQL statements:

```
CREATE TABLE `t1$EX` (
 NDB$server_id INT UNSIGNED,
 NDB$source_server_id INT UNSIGNED,
 NDB$source_epoch BIGINT UNSIGNED,
 NDB$count INT UNSIGNED,
 NDB$OP_TYPE ENUM('WRITE_ROW', 'UPDATE_ROW', 'DELETE_ROW',
 'REFRESH_ROW', 'READ_ROW') NOT NULL,
 NDB$CFT_CAUSE ENUM('ROW_DOES_NOT_EXIST', 'ROW_ALREADY_EXISTS',
 'DATA_IN_CONFLICT', 'TRANS_IN_CONFLICT') NOT NULL,
 a INT NOT NULL,
 PRIMARY KEY(NDB$server_id, NDB$source_server_id,
 NDB$source_epoch, NDB$count)
) ENGINE=NDB;

CREATE TABLE `t2$EX` (
 NDB$server_id INT UNSIGNED,
 NDB$source_server_id INT UNSIGNED,
 NDB$source_epoch BIGINT UNSIGNED,
 NDB$count INT UNSIGNED,
 NDB$OP_TYPE ENUM('WRITE_ROW', 'UPDATE_ROW', 'DELETE_ROW',
 'REFRESH_ROW', 'READ_ROW') NOT NULL,
 NDB$CFT_CAUSE ENUM('ROW_DOES_NOT_EXIST', 'ROW_ALREADY_EXISTS',
 'DATA_IN_CONFLICT', 'TRANS_IN_CONFLICT') NOT NULL,
 a INT NOT NULL,
 PRIMARY KEY(NDB$server_id, NDB$source_server_id,
 NDB$source_epoch, NDB$count)
) ENGINE=NDB;
```

Finally, after creating the exception tables just shown, you can create the data tables to be replicated and subject to conflict resolution control, using the following two SQL statements:

```

CREATE TABLE t1 (
 a INT PRIMARY KEY,
 b VARCHAR(32),
 x INT UNSIGNED
) ENGINE=NDB;

CREATE TABLE t2 (
 a INT PRIMARY KEY,
 b VARCHAR(32),
 x INT UNSIGNED
) ENGINE=NDB;

```

For each table, the `x` column is used as the timestamp column.

Once created on the source, `t1` and `t2` are replicated and can be assumed to exist on both the source and the replica. In the remainder of this example, we use `mysqlS>` to indicate a `mysql` client connected to the source, and `mysqlR>` to indicate a `mysql` client running on the replica.

First we insert one row each into the tables on the source, like this:

```

mysqlS> INSERT INTO t1 VALUES (1, 'Initial X=1', 1);
Query OK, 1 row affected (0.01 sec)

mysqlS> INSERT INTO t2 VALUES (1, 'Initial X=1', 1);
Query OK, 1 row affected (0.01 sec)

```

We can be certain that these two rows are replicated without causing any conflicts, since the tables on the replica did not contain any rows prior to issuing the `INSERT` statements on the source. We can verify this by selecting from the tables on the replica as shown here:

```

mysqlR> TABLE t1 ORDER BY a;
+---+-----+---+
| a | b | x |
+---+-----+---+
| 1 | Initial X=1 | 1 |
+---+-----+---+
1 row in set (0.00 sec)

mysqlR> TABLE t2 ORDER BY a;
+---+-----+---+
| a | b | x |
+---+-----+---+
| 1 | Initial X=1 | 1 |
+---+-----+---+
1 row in set (0.00 sec)

```

Next, we insert new rows into the tables on the replica, like this:

```

mysqlR> INSERT INTO t1 VALUES (2, 'Replica X=2', 2);
Query OK, 1 row affected (0.01 sec)

mysqlR> INSERT INTO t2 VALUES (2, 'Replica X=2', 2);
Query OK, 1 row affected (0.01 sec)

```

Now we insert conflicting rows into the tables on the source having greater timestamp (`x`) column values, using the statements shown here:

```

mysqlS> INSERT INTO t1 VALUES (2, 'Replica X=20', 20);
Query OK, 1 row affected (0.01 sec)

mysqlS> INSERT INTO t2 VALUES (2, 'Replica X=20', 20);
Query OK, 1 row affected (0.01 sec)

```

Now we observe the results by selecting (again) from both tables on the replica, as shown here:

```

mysqlR> TABLE t1 ORDER BY a;
+---+-----+---+
| a | b | x |
+---+-----+---+

```

```
| 1 | Initial X=1 | 1 |
+---+-----+-----+
| 2 | Source X=20 | 20 |
+---+-----+-----+
2 rows in set (0.00 sec)

mysqlR> TABLE t2 ORDER BY a;
+---+-----+-----+
| a | b | x |
+---+-----+-----+
| 1 | Initial X=1 | 1 |
+---+-----+-----+
| 1 | Source X=20 | 20 |
+---+-----+-----+
2 rows in set (0.00 sec)
```

The rows inserted on the source, having greater timestamps than those in the conflicting rows on the replica, have replaced those rows. On the replica, we next insert two new rows which do not conflict with any existing rows in `t1` or `t2`, like this:

```
mysqlR> INSERT INTO t1 VALUES (3, 'Replica X=30', 30);
Query OK, 1 row affected (0.01 sec)

mysqlR> INSERT INTO t2 VALUES (3, 'Replica X=30', 30);
Query OK, 1 row affected (0.01 sec)
```

Inserting more rows on the source with the same primary key value (3) brings about conflicts as before, but this time we use a value for the timestamp column less than that in same column in the conflicting rows on the replica.

```
mysqlS> INSERT INTO t1 VALUES (3, 'Source X=3', 3);
Query OK, 1 row affected (0.01 sec)

mysqlS> INSERT INTO t2 VALUES (3, 'Source X=3', 3);
Query OK, 1 row affected (0.01 sec)
```

We can see by querying the tables that both inserts from the source were rejected by the replica, and the rows inserted on the replica previously have not been overwritten, as shown here in the `mysql` client on the replica:

```
mysqlR> TABLE t1 ORDER BY a;
+---+-----+-----+
| a | b | x |
+---+-----+-----+
| 1 | Initial X=1 | 1 |
+---+-----+-----+
| 2 | Source X=20 | 20 |
+---+-----+-----+
| 3 | Replica X=30 | 30 |
+---+-----+-----+
3 rows in set (0.00 sec)

mysqlR> TABLE t2 ORDER BY a;
+---+-----+-----+
| a | b | x |
+---+-----+-----+
| 1 | Initial X=1 | 1 |
+---+-----+-----+
| 2 | Source X=20 | 20 |
+---+-----+-----+
| 3 | Replica X=30 | 30 |
+---+-----+-----+
3 rows in set (0.00 sec)
```

You can see information about the rows that were rejected in the exception tables, as shown here:

```
mysqlR> SELECT NDB$server_id, NDB$source_server_id, NDB$count,
> NDBOP_TYPE, NDBCFT_CAUSE, a
> FROM t1$EX
> ORDER BY NDB$count\G
```

```
***** 1. row *****
NDB$server_id : 2
NDB$source_server_id: 1
NDB$count : 1
NDB$OP_TYPE : WRITE_ROW
NDB$CFT_CAUSE : DATA_IN_CONFLICT
a : 3
1 row in set (0.00 sec)

mysqlR> SELECT NDB$server_id, NDB$source_server_id, NDB$count,
 > NDBOP_TYPE, NDBCFT_CAUSE, a
 > FROM t2$EX
 > ORDER BY NDB$count\G
***** 1. row *****
NDB$server_id : 2
NDB$source_server_id: 1
NDB$count : 1
NDB$OP_TYPE : WRITE_ROW
NDB$CFT_CAUSE : DATA_IN_CONFLICT
a : 3
1 row in set (0.00 sec)
```

As we saw earlier, no other rows inserted on the source were rejected by the replica, only those rows having a lesser timestamp value than the rows in conflict on the replica.

## 25.8 NDB Cluster Release Notes

Changes in NDB Cluster releases are documented separately from this reference manual; you can find release notes for NDB Cluster 8.4 [NDB 8.4 Release Notes](#).

You can obtain release notes for older versions of NDB Cluster from [NDB Cluster Release Notes](#).

26.6.2 Partitioning Limitations Relating to Storage Engines .....	4581
26.6.3 Partitioning Limitations Relating to Functions .....	4582

This chapter discusses *user-defined partitioning*.

### Note

Table partitioning differs from partitioning as used by window functions. For information about window functions, see [Section 14.20, “Window Functions”](#).

In MySQL 8.4, partitioning support is provided by the `InnoDB` and `NDB` storage engines.

MySQL 8.4 does not currently support partitioning of tables using any storage engine other than `InnoDB` or `NDB`, such as `MyISAM`. An attempt to create a partitioned tables using a storage engine that does not supply native partitioning support fails with `ER_CHECK_NOT_IMPLEMENTED`.

MySQL 8.4 Community binaries provided by Oracle include partitioning support provided by the `InnoDB` and `NDB` storage engines. For information about partitioning support offered in MySQL Enterprise Edition binaries, see [Chapter 32, MySQL Enterprise Edition](#).

If you are compiling MySQL 8.4 from source, configuring the build with `InnoDB` support is sufficient to produce binaries with partition support for `InnoDB` tables. For more information, see [Section 2.8, “Installing MySQL from Source”](#).

Nothing further needs to be done to enable partitioning support by `InnoDB` (for example, no special entries are required in the `my.cnf` file).

It is not possible to disable partitioning support by the `InnoDB` storage engine.

See [Section 26.1, “Overview of Partitioning in MySQL”](#), for an introduction to partitioning and partitioning concepts.

Several types of partitioning are supported, as well as subpartitioning; see [Section 26.2, “Partitioning Types”](#), and [Section 26.2.6, “Subpartitioning”](#).

[Section 26.3, “Partition Management”,](#) covers methods of adding, removing, and altering partitions in existing partitioned tables.

[Section 26.3.4, “Maintenance of Partitions”,](#) discusses table maintenance commands for use with partitioned tables.

The `PARTITIONS` table in the `INFORMATION_SCHEMA` database provides information about partitions and partitioned tables. See [Section 28.3.21, “The INFORMATION\\_SCHEMA PARTITIONS Table”](#), for more information; for some examples of queries against this table, see [Section 26.2.7, “How MySQL Partitioning Handles NULL”](#).

For known issues with partitioning in MySQL 8.4, see [Section 26.6, “Restrictions and Limitations on Partitioning”](#).

You may also find the following resources to be useful when working with partitioned tables.

**Additional Resources.** Other sources of information about user-defined partitioning in MySQL include the following:

- [MySQL Partitioning Forum](#)

This is the official discussion forum for those interested in or experimenting with MySQL Partitioning technology. It features announcements and updates from MySQL developers and others. It is monitored by members of the Partitioning Development and Documentation Teams.

- [PlanetMySQL](#)

A MySQL news site featuring MySQL-related blogs, which should be of interest to anyone using my MySQL. We encourage you to check here for links to blogs kept by those working with MySQL Partitioning, or to have your own blog added to those covered.

## 26.1 Overview of Partitioning in MySQL

This section provides a conceptual overview of partitioning in MySQL 8.4.

For information on partitioning restrictions and feature limitations, see [Section 26.6, “Restrictions and Limitations on Partitioning”](#).

The SQL standard does not provide much in the way of guidance regarding the physical aspects of data storage. The SQL language itself is intended to work independently of any data structures or media underlying the schemas, tables, rows, or columns with which it works. Nonetheless, most advanced database management systems have evolved some means of determining the physical location to be used for storing specific pieces of data in terms of the file system, hardware or even both. In MySQL, the `InnoDB` storage engine has long supported the notion of a tablespace (see [Section 17.6.3, “Tablespaces”](#)), and the MySQL Server, even prior to the introduction of partitioning, could be configured to employ different physical directories for storing different databases (see [Section 10.12.2, “Using Symbolic Links”](#), for an explanation of how this is done).

*Partitioning* takes this notion a step further, by enabling you to distribute portions of individual tables across a file system according to rules which you can set largely as needed. In effect, different portions of a table are stored as separate tables in different locations. The user-selected rule by which the division of data is accomplished is known as a *partitioning function*, which in MySQL can be the modulus, simple matching against a set of ranges or value lists, an internal hashing function, or a linear hashing function. The function is selected according to the partitioning type specified by the user, and takes as its parameter the value of a user-supplied expression. This expression can be a column value, a function acting on one or more column values, or a set of one or more column values, depending on the type of partitioning that is used.

In the case of `RANGE`, `LIST`, and `[LINEAR] HASH` partitioning, the value of the partitioning column is passed to the partitioning function, which returns an integer value representing the number of the

partition in which that particular record should be stored. This function must be nonconstant and nonrandom. It may not contain any queries, but may use an SQL expression that is valid in MySQL, as long as that expression returns either `NULL` or an integer `intval` such that

```
-MAXVALUE <= intval <= MAXVALUE
```

(`MAXVALUE` is used to represent the least upper bound for the type of integer in question. `-MAXVALUE` represents the greatest lower bound.)

For [`LINEAR`] `KEY`, `RANGE COLUMNS`, and `LIST COLUMNS` partitioning, the partitioning expression consists of a list of one or more columns.

For [`LINEAR`] `KEY` partitioning, the partitioning function is supplied by MySQL.

For more information about permitted partitioning column types and partitioning functions, see [Section 26.2, “Partitioning Types”](#), as well as [Section 15.1.20, “CREATE TABLE Statement”](#), which provides partitioning syntax descriptions and additional examples. For information about restrictions on partitioning functions, see [Section 26.6.3, “Partitioning Limitations Relating to Functions”](#).

This is known as *horizontal partitioning*—that is, different rows of a table may be assigned to different physical partitions. MySQL 8.4 does not support *vertical partitioning*, in which different columns of a table are assigned to different physical partitions. There are no plans at this time to introduce vertical partitioning into MySQL.

For creating partitioned tables, you must use a storage engine that supports them. In MySQL 8.4, all partitions of the same partitioned table must use the same storage engine. However, there is nothing preventing you from using different storage engines for different partitioned tables on the same MySQL server or even in the same database.

In MySQL 8.4, the only storage engines that support partitioning are `InnoDB` and `NDB`. Partitioning cannot be used with storage engines that do not support it; these include the `MyISAM`, `MERGE`, `CSV`, and `FEDERATED` storage engines.

Partitioning by `KEY` or `LINEAR KEY` is possible with `NDB`, but other types of user-defined partitioning are not supported for tables using this storage engine. In addition, an `NDB` table that employs user-defined partitioning must have an explicit primary key, and any columns referenced in the table's partitioning expression must be part of the primary key. However, if no columns are listed in the `PARTITION BY KEY` or `PARTITION BY LINEAR KEY` clause of the `CREATE TABLE` or `ALTER TABLE` statement used to create or modify a user-partitioned `NDB` table, then the table is not required to have an explicit primary key. For more information, see [Section 25.2.7.1, “Noncompliance with SQL Syntax in NDB Cluster”](#).

When creating a partitioned table, the default storage engine is used just as when creating any other table; to override this behavior, it is necessary only to use the `[STORAGE] ENGINE` option just as you would for a table that is not partitioned. The target storage engine must provide native partitioning support, or the statement fails. You should keep in mind that `[STORAGE] ENGINE` (and other table options) need to be listed *before* any partitioning options are used in a `CREATE TABLE` statement. This example shows how to create a table that is partitioned by hash into 6 partitions and which uses the `Innodb` storage engine (regardless of the value of `default_storage_engine`):

```
CREATE TABLE ti (id INT, amount DECIMAL(7,2), tr_date DATE)
 ENGINE=INNODB
 PARTITION BY HASH(MONTH(tr_date))
 PARTITIONS 6;
```

Each `PARTITION` clause can include a `[STORAGE] ENGINE` option, but in MySQL 8.4 this has no effect.

Unless otherwise specified, the remaining examples in this discussion assume that `default_storage_engine` is `InnoDB`.

**Important**

Partitioning applies to all data and indexes of a table; you cannot partition only the data and not the indexes, or vice versa, nor can you partition only a portion of the table.

Data and indexes for each partition can be assigned to a specific directory using the `DATA DIRECTORY` and `INDEX DIRECTORY` options for the `PARTITION` clause of the `CREATE TABLE` statement used to create the partitioned table.

Only the `DATA DIRECTORY` option is supported for individual partitions and subpartitions of `InnoDB` tables. The directory specified in a `DATA DIRECTORY` clause must be known to `InnoDB`. For more information, see [Using the DATA DIRECTORY Clause](#).

All columns used in the table's partitioning expression must be part of every unique key that the table may have, including any primary key. This means that a table such as this one, created by the following SQL statement, cannot be partitioned:

```
CREATE TABLE tnp (
 id INT NOT NULL AUTO_INCREMENT,
 ref BIGINT NOT NULL,
 name VARCHAR(255),
 PRIMARY KEY pk (id),
 UNIQUE KEY uk (name)
);
```

Because the keys `pk` and `uk` have no columns in common, there are no columns available for use in a partitioning expression. Possible workarounds in this situation include adding the `name` column to the table's primary key, adding the `id` column to `uk`, or simply removing the unique key altogether. See [Section 26.6.1, “Partitioning Keys, Primary Keys, and Unique Keys”](#), for more information.

In addition, `MAX_ROWS` and `MIN_ROWS` can be used to determine the maximum and minimum numbers of rows, respectively, that can be stored in each partition. See [Section 26.3, “Partition Management”](#), for more information on these options.

The `MAX_ROWS` option can also be useful for creating NDB Cluster tables with extra partitions, thus allowing for greater storage of hash indexes. See the documentation for the `DataMemory` data node configuration parameter, as well as [Section 25.2.2, “NDB Cluster Nodes, Node Groups, Fragment Replicas, and Partitions”](#), for more information.

Some advantages of partitioning are listed here:

- Partitioning makes it possible to store more data in one table than can be held on a single disk or file system partition.
- Data that loses its usefulness can often be easily removed from a partitioned table by dropping the partition (or partitions) containing only that data. Conversely, the process of adding new data can in some cases be greatly facilitated by adding one or more new partitions for storing specifically that data.
- Some queries can be greatly optimized in virtue of the fact that data satisfying a given `WHERE` clause can be stored only on one or more partitions, which automatically excludes any remaining partitions from the search. Because partitions can be altered after a partitioned table has been created, you can reorganize your data to enhance frequent queries that may not have been often used when the partitioning scheme was first set up. This ability to exclude non-matching partitions (and thus any rows they contain) is often referred to as *partition pruning*. For more information, see [Section 26.4, “Partition Pruning”](#).

In addition, MySQL supports explicit partition selection for queries. For example, `SELECT * FROM t PARTITION (p0,p1) WHERE c < 5` selects only those rows in partitions `p0` and `p1` that match the `WHERE` condition. In this case, MySQL does not check any other partitions of table `t`; this can greatly speed up queries when you already know which partition or partitions you wish to

examine. Partition selection is also supported for the data modification statements `DELETE`, `INSERT`, `REPLACE`, `UPDATE`, and `LOAD DATA`, `LOAD XML`. See the descriptions of these statements for more information and examples.

## 26.2 Partitioning Types

This section discusses the types of partitioning which are available in MySQL 8.4. These include the types listed here:

- **RANGE partitioning.** This type of partitioning assigns rows to partitions based on column values falling within a given range. See [Section 26.2.1, “RANGE Partitioning”](#). For information about an extension to this type, `RANGE COLUMNS`, see [Section 26.2.3.1, “RANGE COLUMNS partitioning”](#).
- **LIST partitioning.** Similar to partitioning by `RANGE`, except that the partition is selected based on columns matching one of a set of discrete values. See [Section 26.2.2, “LIST Partitioning”](#). For information about an extension to this type, `LIST COLUMNS`, see [Section 26.2.3.2, “LIST COLUMNS partitioning”](#).
- **HASH partitioning.** With this type of partitioning, a partition is selected based on the value returned by a user-defined expression that operates on column values in rows to be inserted into the table. The function may consist of any expression valid in MySQL that yields an integer value. See [Section 26.2.4, “HASH Partitioning”](#).

An extension to this type, `LINEAR HASH`, is also available, see [Section 26.2.4.1, “LINEAR HASH Partitioning”](#).

- **KEY partitioning.** This type of partitioning is similar to partitioning by `HASH`, except that only one or more columns to be evaluated are supplied, and the MySQL server provides its own hashing function. These columns can contain other than integer values, since the hashing function supplied by MySQL guarantees an integer result regardless of the column data type. An extension to this type, `LINEAR KEY`, is also available. See [Section 26.2.5, “KEY Partitioning”](#).

A very common use of database partitioning is to segregate data by date. Some database systems support explicit date partitioning, which MySQL does not implement in 8.4. However, it is not difficult in MySQL to create partitioning schemes based on `DATE`, `TIME`, or `DATETIME` columns, or based on expressions making use of such columns.

When partitioning by `KEY` or `LINEAR KEY`, you can use a `DATE`, `TIME`, or `DATETIME` column as the partitioning column without performing any modification of the column value. For example, this table creation statement is perfectly valid in MySQL:

```
CREATE TABLE members (
 firstname VARCHAR(25) NOT NULL,
 lastname VARCHAR(25) NOT NULL,
 username VARCHAR(16) NOT NULL,
 email VARCHAR(35),
 joined DATE NOT NULL
)
PARTITION BY KEY(joined)
PARTITIONS 6;
```

In MySQL 8.4, it is also possible to use a `DATE` or `DATETIME` column as the partitioning column using `RANGE COLUMNS` and `LIST COLUMNS` partitioning.

Other partitioning types require a partitioning expression that yields an integer value or `NULL`. If you wish to use date-based partitioning by `RANGE`, `LIST`, `HASH`, or `LINEAR HASH`, you can simply employ a function that operates on a `DATE`, `TIME`, or `DATETIME` column and returns such a value, as shown here:

```
CREATE TABLE members (
 firstname VARCHAR(25) NOT NULL,
 lastname VARCHAR(25) NOT NULL,
```

```

 username VARCHAR(16) NOT NULL,
 email VARCHAR(35),
 joined DATE NOT NULL
)
PARTITION BY RANGE(YEAR(joined)) (
 PARTITION p0 VALUES LESS THAN (1960),
 PARTITION p1 VALUES LESS THAN (1970),
 PARTITION p2 VALUES LESS THAN (1980),
 PARTITION p3 VALUES LESS THAN (1990),
 PARTITION p4 VALUES LESS THAN MAXVALUE
) ;

```

Additional examples of partitioning using dates may be found in the following sections of this chapter:

- [Section 26.2.1, “RANGE Partitioning”](#)
- [Section 26.2.4, “HASH Partitioning”](#)
- [Section 26.2.4.1, “LINEAR HASH Partitioning”](#)

For more complex examples of date-based partitioning, see the following sections:

- [Section 26.4, “Partition Pruning”](#)
- [Section 26.2.6, “Subpartitioning”](#)

MySQL partitioning is optimized for use with the `TO_DAYS()`, `YEAR()`, and `TO_SECONDS()` functions. However, you can use other date and time functions that return an integer or `NULL`, such as `WEEKDAY()`, `DAYOFYEAR()`, or `MONTH()`. See [Section 14.7, “Date and Time Functions”](#), for more information about such functions.

It is important to remember—regardless of the type of partitioning that you use—that partitions are always numbered automatically and in sequence when created, starting with `0`. When a new row is inserted into a partitioned table, it is these partition numbers that are used in identifying the correct partition. For example, if your table uses 4 partitions, these partitions are numbered `0`, `1`, `2`, and `3`. For the `RANGE` and `LIST` partitioning types, it is necessary to ensure that there is a partition defined for each partition number. For `HASH` partitioning, the user-supplied expression must evaluate to an integer value. For `KEY` partitioning, this issue is taken care of automatically by the hashing function which the MySQL server employs internally.

Names of partitions generally follow the rules governing other MySQL identifiers, such as those for tables and databases. However, you should note that partition names are not case-sensitive. For example, the following `CREATE TABLE` statement fails as shown:

```

mysql> CREATE TABLE t2 (val INT)
-> PARTITION BY LIST(val)
-> PARTITION mypart VALUES IN (1,3,5),
-> PARTITION MyPart VALUES IN (2,4,6)
-> ;
ERROR 1488 (HY000): Duplicate partition name mypart

```

Failure occurs because MySQL sees no difference between the partition names `mypart` and `MyPart`.

When you specify the number of partitions for the table, this must be expressed as a positive, nonzero integer literal with no leading zeros, and may not be an expression such as `0.8E+01` or `6-2`, even if it evaluates to an integer value. Decimal fractions are not permitted.

In the sections that follow, we do not necessarily provide all possible forms for the syntax that can be used for creating each partition type; for this information, see [Section 15.1.20, “CREATE TABLE Statement”](#).

## 26.2.1 RANGE Partitioning

A table that is partitioned by range is partitioned in such a way that each partition contains rows for which the partitioning expression value lies within a given range. Ranges should be contiguous but

not overlapping, and are defined using the `VALUES LESS THAN` operator. For the next few examples, suppose that you are creating a table such as the following to hold personnel records for a chain of 20 video stores, numbered 1 through 20:

```
CREATE TABLE employees (
 id INT NOT NULL,
 fname VARCHAR(30),
 lname VARCHAR(30),
 hired DATE NOT NULL DEFAULT '1970-01-01',
 separated DATE NOT NULL DEFAULT '9999-12-31',
 job_code INT NOT NULL,
 store_id INT NOT NULL
);
```

### Note

The `employees` table used here has no primary or unique keys. While the examples work as shown for purposes of the present discussion, you should keep in mind that tables are extremely likely in practice to have primary keys, unique keys, or both, and that allowable choices for partitioning columns depend on the columns used for these keys, if any are present. For a discussion of these issues, see [Section 26.6.1, “Partitioning Keys, Primary Keys, and Unique Keys”](#).

This table can be partitioned by range in a number of ways, depending on your needs. One way would be to use the `store_id` column. For instance, you might decide to partition the table 4 ways by adding a `PARTITION BY RANGE` clause as shown here:

```
CREATE TABLE employees (
 id INT NOT NULL,
 fname VARCHAR(30),
 lname VARCHAR(30),
 hired DATE NOT NULL DEFAULT '1970-01-01',
 separated DATE NOT NULL DEFAULT '9999-12-31',
 job_code INT NOT NULL,
 store_id INT NOT NULL
)
PARTITION BY RANGE (store_id) (
 PARTITION p0 VALUES LESS THAN (6),
 PARTITION p1 VALUES LESS THAN (11),
 PARTITION p2 VALUES LESS THAN (16),
 PARTITION p3 VALUES LESS THAN (21)
);
```

In this partitioning scheme, all rows corresponding to employees working at stores 1 through 5 are stored in partition `p0`, to those employed at stores 6 through 10 are stored in partition `p1`, and so on. Each partition is defined in order, from lowest to highest. This is a requirement of the `PARTITION BY RANGE` syntax; you can think of it as being analogous to a series of `if ... elseif ...` statements in C or Java in this regard.

It is easy to determine that a new row containing the data `(72, 'Mitchell', 'Wilson', '1998-06-25', DEFAULT, 7, 13)` is inserted into partition `p2`, but what happens when your chain adds a 21<sup>st</sup> store? Under this scheme, there is no rule that covers a row whose `store_id` is greater than 20, so an error results because the server does not know where to place it. You can keep this from occurring by using a “catchall” `VALUES LESS THAN` clause in the `CREATE TABLE` statement that provides for all values greater than the highest value explicitly named:

```
CREATE TABLE employees (
 id INT NOT NULL,
 fname VARCHAR(30),
 lname VARCHAR(30),
 hired DATE NOT NULL DEFAULT '1970-01-01',
 separated DATE NOT NULL DEFAULT '9999-12-31',
 job_code INT NOT NULL,
 store_id INT NOT NULL
)
```

```
PARTITION BY RANGE (store_id) (
 PARTITION p0 VALUES LESS THAN (6),
 PARTITION p1 VALUES LESS THAN (11),
 PARTITION p2 VALUES LESS THAN (16),
 PARTITION p3 VALUES LESS THAN MAXVALUE
);
```

(As with the other examples in this chapter, we assume that the default storage engine is [InnoDB](#).)

Another way to avoid an error when no matching value is found is to use the [IGNORE](#) keyword as part of the [INSERT](#) statement. For an example, see [Section 26.2.2, “LIST Partitioning”](#).

[MAXVALUE](#) represents an integer value that is always greater than the largest possible integer value (in mathematical language, it serves as a *least upper bound*). Now, any rows whose `store_id` column value is greater than or equal to 16 (the highest value defined) are stored in partition `p3`. At some point in the future—when the number of stores has increased to 25, 30, or more—you can use an [ALTER TABLE](#) statement to add new partitions for stores 21-25, 26-30, and so on (see [Section 26.3, “Partition Management”](#), for details of how to do this).

In much the same fashion, you could partition the table based on employee job codes—that is, based on ranges of `job_code` column values. For example—assuming that two-digit job codes are used for regular (in-store) workers, three-digit codes are used for office and support personnel, and four-digit codes are used for management positions—you could create the partitioned table using the following statement:

```
CREATE TABLE employees (
 id INT NOT NULL,
 fname VARCHAR(30),
 lname VARCHAR(30),
 hired DATE NOT NULL DEFAULT '1970-01-01',
 separated DATE NOT NULL DEFAULT '9999-12-31',
 job_code INT NOT NULL,
 store_id INT NOT NULL
)
PARTITION BY RANGE (job_code) (
 PARTITION p0 VALUES LESS THAN (100),
 PARTITION p1 VALUES LESS THAN (1000),
 PARTITION p2 VALUES LESS THAN (10000)
);
```

In this instance, all rows relating to in-store workers would be stored in partition `p0`, those relating to office and support staff in `p1`, and those relating to managers in partition `p2`.

It is also possible to use an expression in `VALUES LESS THAN` clauses. However, MySQL must be able to evaluate the expression's return value as part of a `LESS THAN (<)` comparison.

Rather than splitting up the table data according to store number, you can use an expression based on one of the two `DATE` columns instead. For example, let us suppose that you wish to partition based on the year that each employee left the company; that is, the value of `YEAR(separated)`. An example of a `CREATE TABLE` statement that implements such a partitioning scheme is shown here:

```
CREATE TABLE employees (
 id INT NOT NULL,
 fname VARCHAR(30),
 lname VARCHAR(30),
 hired DATE NOT NULL DEFAULT '1970-01-01',
 separated DATE NOT NULL DEFAULT '9999-12-31',
 job_code INT,
 store_id INT
)
PARTITION BY RANGE (YEAR(separated)) (
 PARTITION p0 VALUES LESS THAN (1991),
 PARTITION p1 VALUES LESS THAN (1996),
 PARTITION p2 VALUES LESS THAN (2001),
 PARTITION p3 VALUES LESS THAN MAXVALUE
);
```

In this scheme, for all employees who left before 1991, the rows are stored in partition `p0`; for those who left in the years 1991 through 1995, in `p1`; for those who left in the years 1996 through 2000, in `p2`; and for any workers who left after the year 2000, in `p3`.

It is also possible to partition a table by `RANGE`, based on the value of a `TIMESTAMP` column, using the `UNIX_TIMESTAMP()` function, as shown in this example:

```
CREATE TABLE quarterly_report_status (
 report_id INT NOT NULL,
 report_status VARCHAR(20) NOT NULL,
 report_updated TIMESTAMP NOT NULL DEFAULT CURRENT_TIMESTAMP ON UPDATE CURRENT_TIMESTAMP
)
PARTITION BY RANGE (UNIX_TIMESTAMP(report_updated)) (
 PARTITION p0 VALUES LESS THAN (UNIX_TIMESTAMP('2008-01-01 00:00:00')),
 PARTITION p1 VALUES LESS THAN (UNIX_TIMESTAMP('2008-04-01 00:00:00')),
 PARTITION p2 VALUES LESS THAN (UNIX_TIMESTAMP('2008-07-01 00:00:00')),
 PARTITION p3 VALUES LESS THAN (UNIX_TIMESTAMP('2008-10-01 00:00:00')),
 PARTITION p4 VALUES LESS THAN (UNIX_TIMESTAMP('2009-01-01 00:00:00')),
 PARTITION p5 VALUES LESS THAN (UNIX_TIMESTAMP('2009-04-01 00:00:00')),
 PARTITION p6 VALUES LESS THAN (UNIX_TIMESTAMP('2009-07-01 00:00:00')),
 PARTITION p7 VALUES LESS THAN (UNIX_TIMESTAMP('2009-10-01 00:00:00')),
 PARTITION p8 VALUES LESS THAN (UNIX_TIMESTAMP('2010-01-01 00:00:00')),
 PARTITION p9 VALUES LESS THAN (MAXVALUE)
);
```

Any other expressions involving `TIMESTAMP` values are not permitted. (See Bug #42849.)

Range partitioning is particularly useful when one or more of the following conditions is true:

- You want or need to delete “old” data. If you are using the partitioning scheme shown previously for the `employees` table, you can simply use `ALTER TABLE employees DROP PARTITION p0`; to delete all rows relating to employees who stopped working for the firm prior to 1991. (See [Section 15.1.9, “ALTER TABLE Statement”](#), and [Section 26.3, “Partition Management”](#), for more information.) For a table with a great many rows, this can be much more efficient than running a `DELETE` query such as `DELETE FROM employees WHERE YEAR(separated) <= 1990`.
- You want to use a column containing date or time values, or containing values arising from some other series.
- You frequently run queries that depend directly on the column used for partitioning the table. For example, when executing a query such as `EXPLAIN SELECT COUNT(*) FROM employees WHERE separated BETWEEN '2000-01-01' AND '2000-12-31' GROUP BY store_id;`, MySQL can quickly determine that only partition `p2` needs to be scanned because the remaining partitions cannot contain any records satisfying the `WHERE` clause. See [Section 26.4, “Partition Pruning”](#), for more information about how this is accomplished.

A variant on this type of partitioning is `RANGE COLUMNS` partitioning. Partitioning by `RANGE COLUMNS` makes it possible to employ multiple columns for defining partitioning ranges that apply both to placement of rows in partitions and for determining the inclusion or exclusion of specific partitions when performing partition pruning. See [Section 26.2.3.1, “RANGE COLUMNS partitioning”](#), for more information.

**Partitioning schemes based on time intervals.** If you wish to implement a partitioning scheme based on ranges or intervals of time in MySQL 8.4, you have two options:

1. Partition the table by `RANGE`, and for the partitioning expression, employ a function operating on a `DATE`, `TIME`, or `DATETIME` column and returning an integer value, as shown here:

```
CREATE TABLE members (
 firstname VARCHAR(25) NOT NULL,
 lastname VARCHAR(25) NOT NULL,
 username VARCHAR(16) NOT NULL,
 email VARCHAR(35),
 joined DATE NOT NULL
)
PARTITION BY RANGE(YEAR(joined)) (
```

```
PARTITION p0 VALUES LESS THAN (1960),
PARTITION p1 VALUES LESS THAN (1970),
PARTITION p2 VALUES LESS THAN (1980),
PARTITION p3 VALUES LESS THAN (1990),
PARTITION p4 VALUES LESS THAN MAXVALUE
);
```

In MySQL 8.4, it is also possible to partition a table by [RANGE](#) based on the value of a [TIMESTAMP](#) column, using the [UNIX\\_TIMESTAMP\( \)](#) function, as shown in this example:

```
CREATE TABLE quarterly_report_status (
 report_id INT NOT NULL,
 report_status VARCHAR(20) NOT NULL,
 report_updated TIMESTAMP NOT NULL DEFAULT CURRENT_TIMESTAMP ON UPDATE CURRENT_TIMESTAMP
)
PARTITION BY RANGE (UNIX_TIMESTAMP(report_updated)) (
 PARTITION p0 VALUES LESS THAN (UNIX_TIMESTAMP('2008-01-01 00:00:00')),
 PARTITION p1 VALUES LESS THAN (UNIX_TIMESTAMP('2008-04-01 00:00:00')),
 PARTITION p2 VALUES LESS THAN (UNIX_TIMESTAMP('2008-07-01 00:00:00')),
 PARTITION p3 VALUES LESS THAN (UNIX_TIMESTAMP('2008-10-01 00:00:00')),
 PARTITION p4 VALUES LESS THAN (UNIX_TIMESTAMP('2009-01-01 00:00:00')),
 PARTITION p5 VALUES LESS THAN (UNIX_TIMESTAMP('2009-04-01 00:00:00')),
 PARTITION p6 VALUES LESS THAN (UNIX_TIMESTAMP('2009-07-01 00:00:00')),
 PARTITION p7 VALUES LESS THAN (UNIX_TIMESTAMP('2009-10-01 00:00:00')),
 PARTITION p8 VALUES LESS THAN (UNIX_TIMESTAMP('2010-01-01 00:00:00')),
 PARTITION p9 VALUES LESS THAN (MAXVALUE)
);
```

In MySQL 8.4, any other expressions involving [TIMESTAMP](#) values are not permitted. (See Bug #42849.)

### Note

It is also possible in MySQL 8.4 to use [UNIX\\_TIMESTAMP\(timestamp\\_column\)](#) as a partitioning expression for tables that are partitioned by [LIST](#). However, it is usually not practical to do so.

- Partition the table by [RANGE COLUMNS](#), using a [DATE](#) or [DATETIME](#) column as the partitioning column. For example, the `members` table could be defined using the `joined` column directly, as shown here:

```
CREATE TABLE members (
 firstname VARCHAR(25) NOT NULL,
 lastname VARCHAR(25) NOT NULL,
 username VARCHAR(16) NOT NULL,
 email VARCHAR(35),
 joined DATE NOT NULL
)
PARTITION BY RANGE COLUMNS(joined) (
 PARTITION p0 VALUES LESS THAN ('1960-01-01'),
 PARTITION p1 VALUES LESS THAN ('1970-01-01'),
 PARTITION p2 VALUES LESS THAN ('1980-01-01'),
 PARTITION p3 VALUES LESS THAN ('1990-01-01'),
 PARTITION p4 VALUES LESS THAN MAXVALUE
);
```

### Note

The use of partitioning columns employing date or time types other than [DATE](#) or [DATETIME](#) is not supported with [RANGE COLUMNS](#).

## 26.2.2 LIST Partitioning

List partitioning in MySQL is similar to range partitioning in many ways. As in partitioning by [RANGE](#), each partition must be explicitly defined. The chief difference between the two types of partitioning is that, in list partitioning, each partition is defined and selected based on the membership of a column

value in one of a set of value lists, rather than in one of a set of contiguous ranges of values. This is done by using `PARTITION BY LIST(expr)` where `expr` is a column value or an expression based on a column value and returning an integer value, and then defining each partition by means of a `VALUES IN (value_list)`, where `value_list` is a comma-separated list of integers.

### Note

In MySQL 8.4, it is possible to match against only a list of integers (and possibly `NULL`—see [Section 26.2.7, “How MySQL Partitioning Handles NULL”](#)) when partitioning by `LIST`.

However, other column types may be used in value lists when employing `LIST COLUMN` partitioning, which is described later in this section.

Unlike the case with partitions defined by range, list partitions do not need to be declared in any particular order. For more detailed syntactical information, see [Section 15.1.20, “CREATE TABLE Statement”](#).

For the examples that follow, we assume that the basic definition of the table to be partitioned is provided by the `CREATE TABLE` statement shown here:

```
CREATE TABLE employees (
 id INT NOT NULL,
 fname VARCHAR(30),
 lname VARCHAR(30),
 hired DATE NOT NULL DEFAULT '1970-01-01',
 separated DATE NOT NULL DEFAULT '9999-12-31',
 job_code INT,
 store_id INT
);
```

(This is the same table used as a basis for the examples in [Section 26.2.1, “RANGE Partitioning”](#). As with the other partitioning examples, we assume that the `default_storage_engine` is `InnoDB`.)

Suppose that there are 20 video stores distributed among 4 franchises as shown in the following table.

Region	Store ID Numbers
North	3, 5, 6, 9, 17
East	1, 2, 10, 11, 19, 20
West	4, 12, 13, 14, 18
Central	7, 8, 15, 16

To partition this table in such a way that rows for stores belonging to the same region are stored in the same partition, you could use the `CREATE TABLE` statement shown here:

```
CREATE TABLE employees (
 id INT NOT NULL,
 fname VARCHAR(30),
 lname VARCHAR(30),
 hired DATE NOT NULL DEFAULT '1970-01-01',
 separated DATE NOT NULL DEFAULT '9999-12-31',
 job_code INT,
 store_id INT
)
PARTITION BY LIST(store_id) (
 PARTITION pNorth VALUES IN (3,5,6,9,17),
 PARTITION pEast VALUES IN (1,2,10,11,19,20),
 PARTITION pWest VALUES IN (4,12,13,14,18),
 PARTITION pCentral VALUES IN (7,8,15,16)
);
```

This makes it easy to add or drop employee records relating to specific regions to or from the table. For instance, suppose that all stores in the West region are sold to another company. In MySQL 8.4, all rows relating to employees working at stores in that region can be deleted with the query

`ALTER TABLE employees TRUNCATE PARTITION pWest`, which can be executed much more efficiently than the equivalent `DELETE` statement `DELETE FROM employees WHERE store_id IN (4,12,13,14,18);`. (Using `ALTER TABLE employees DROP PARTITION pWest` would also delete all of these rows, but would also remove the partition `pWest` from the definition of the table; you would need to use an `ALTER TABLE ... ADD PARTITION` statement to restore the table's original partitioning scheme.)

As with `RANGE` partitioning, it is possible to combine `LIST` partitioning with partitioning by hash or key to produce a composite partitioning (subpartitioning). See [Section 26.2.6, “Subpartitioning”](#).

Unlike the case with `RANGE` partitioning, there is no “catch-all” such as `MAXVALUE`; all expected values for the partitioning expression should be covered in `PARTITION ... VALUES IN (...)` clauses. An `INSERT` statement containing an unmatched partitioning column value fails with an error, as shown in this example:

```
mysql> CREATE TABLE h2 (
-> c1 INT,
-> c2 INT
->)
-> PARTITION BY LIST(c1) (
-> PARTITION p0 VALUES IN (1, 4, 7),
-> PARTITION p1 VALUES IN (2, 5, 8)
->);
Query OK, 0 rows affected (0.11 sec)

mysql> INSERT INTO h2 VALUES (3, 5);
ERROR 1525 (HY000): Table has no partition for value 3
```

When inserting multiple rows using a single `INSERT` statement into a single InnoDB table, InnoDB considers the statement a single transaction, so that the presence of any unmatched values causes the statement to fail completely, and so no rows are inserted.

You can cause this type of error to be ignored by using the `IGNORE` keyword, although a warning is issued for each row containing unmatched partitioning column values, as shown here.

```
mysql> TRUNCATE h2;
Query OK, 1 row affected (0.00 sec)

mysql> TABLE h2;
Empty set (0.00 sec)

mysql> INSERT IGNORE INTO h2 VALUES (2, 5), (6, 10), (7, 5), (3, 1), (1, 9);
Query OK, 3 rows affected, 2 warnings (0.01 sec)
Records: 5 Duplicates: 2 Warnings: 2

mysql> SHOW WARNINGS;
+-----+-----+
| Level | Code | Message |
+-----+-----+
| Warning | 1526 | Table has no partition for value 6 |
| Warning | 1526 | Table has no partition for value 3 |
+-----+-----+
2 rows in set (0.00 sec)
```

You can see in the output of the following `TABLE` statement that rows containing unmatched partitioning column values were silently rejected, while rows containing no unmatched values were inserted into the table:

```
mysql> TABLE h2;
+-----+-----+
| c1 | c2 |
+-----+-----+
| 7 | 5 |
| 1 | 9 |
| 2 | 5 |
+-----+-----+
3 rows in set (0.00 sec)
```

MySQL also provides support for `LIST COLUMNS` partitioning, a variant of `LIST` partitioning that enables you to use columns of types other than integer for partitioning columns, and to use multiple columns as partitioning keys. For more information, see [Section 26.2.3.2, “LIST COLUMNS partitioning”](#).

## 26.2.3 COLUMNS Partitioning

The next two sections discuss `COLUMNS partitioning`, which are variants on `RANGE` and `LIST` partitioning. `COLUMNS` partitioning enables the use of multiple columns in partitioning keys. All of these columns are taken into account both for the purpose of placing rows in partitions and for the determination of which partitions are to be checked for matching rows in partition pruning.

In addition, both `RANGE COLUMNS` partitioning and `LIST COLUMNS` partitioning support the use of non-integer columns for defining value ranges or list members. The permitted data types are shown in the following list:

- All integer types: `TINYINT`, `SMALLINT`, `MEDIUMINT`, `INT` (`INTEGER`), and `BIGINT`. (This is the same as with partitioning by `RANGE` and `LIST`.)

Other numeric data types (such as `DECIMAL` or `FLOAT`) are not supported as partitioning columns.

- `DATE` and `DATETIME`.

Columns using other data types relating to dates or times are not supported as partitioning columns.

- The following string types: `CHAR`, `VARCHAR`, `BINARY`, and `VARBINARY`.

`TEXT` and `BLOB` columns are not supported as partitioning columns.

The discussions of `RANGE COLUMNS` and `LIST COLUMNS` partitioning in the next two sections assume that you are already familiar with partitioning based on ranges and lists as supported in MySQL 5.1 and later; for more information about these, see [Section 26.2.1, “RANGE Partitioning”](#), and [Section 26.2.2, “LIST Partitioning”](#), respectively.

### 26.2.3.1 RANGE COLUMNS partitioning

Range columns partitioning is similar to range partitioning, but enables you to define partitions using ranges based on multiple column values. In addition, you can define the ranges using columns of types other than integer types.

`RANGE COLUMNS` partitioning differs significantly from `RANGE` partitioning in the following ways:

- `RANGE COLUMNS` does not accept expressions, only names of columns.
- `RANGE COLUMNS` accepts a list of one or more columns.

`RANGE COLUMNS` partitions are based on comparisons between *tuples* (lists of column values) rather than comparisons between scalar values. Placement of rows in `RANGE COLUMNS` partitions is also based on comparisons between tuples; this is discussed further later in this section.

- `RANGE COLUMNS` partitioning columns are not restricted to integer columns; string, `DATE` and `DATETIME` columns can also be used as partitioning columns. (See [Section 26.2.3, “COLUMNS Partitioning”](#), for details.)

The basic syntax for creating a table partitioned by `RANGE COLUMNS` is shown here:

```
CREATE TABLE table_name
PARTITION BY RANGE COLUMNS(column_list) (
 PARTITION partition_name VALUES LESS THAN (value_list)[,

 PARTITION partition_name VALUES LESS THAN (value_list)][,

 ...]
)

column_list:
```

```
column_name[, column_name][, ...]
value_list:
 value[, value][, ...]
```

### Note

Not all `CREATE TABLE` options that can be used when creating partitioned tables are shown here. For complete information, see [Section 15.1.20, “CREATE TABLE Statement”](#).

In the syntax just shown, `column_list` is a list of one or more columns (sometimes called a *partitioning column list*), and `value_list` is a list of values (that is, it is a *partition definition value list*). A `value_list` must be supplied for each partition definition, and each `value_list` must have the same number of values as the `column_list` has columns. Generally speaking, if you use `N` columns in the `COLUMNS` clause, then each `VALUES LESS THAN` clause must also be supplied with a list of `N` values.

The elements in the partitioning column list and in the value list defining each partition must occur in the same order. In addition, each element in the value list must be of the same data type as the corresponding element in the column list. However, the order of the column names in the partitioning column list and the value lists does not have to be the same as the order of the table column definitions in the main part of the `CREATE TABLE` statement. As with table partitioned by `RANGE`, you can use `MAXVALUE` to represent a value such that any legal value inserted into a given column is always less than this value. Here is an example of a `CREATE TABLE` statement that helps to illustrate all of these points:

```
mysql> CREATE TABLE rcx (
-> a INT,
-> b INT,
-> c CHAR(3),
-> d INT
->)
-> PARTITION BY RANGE COLUMNS(a,d,c) (
-> PARTITION p0 VALUES LESS THAN (5,10,'ggg'),
-> PARTITION p1 VALUES LESS THAN (10,20,'mmm'),
-> PARTITION p2 VALUES LESS THAN (15,30,'sss'),
-> PARTITION p3 VALUES LESS THAN (MAXVALUE,MAXVALUE,MAXVALUE)
->);
Query OK, 0 rows affected (0.15 sec)
```

Table `rcx` contains the columns `a`, `b`, `c`, `d`. The partitioning column list supplied to the `COLUMNS` clause uses 3 of these columns, in the order `a`, `d`, `c`. Each value list used to define a partition contains 3 values in the same order; that is, each value list tuple has the form (`INT`, `INT`, `CHAR(3)`), which corresponds to the data types used by columns `a`, `d`, and `c` (in that order).

Placement of rows into partitions is determined by comparing the tuple from a row to be inserted that matches the column list in the `COLUMNS` clause with the tuples used in the `VALUES LESS THAN` clauses to define partitions of the table. Because we are comparing tuples (that is, lists or sets of values) rather than scalar values, the semantics of `VALUES LESS THAN` as used with `RANGE COLUMNS` partitions differs somewhat from the case with simple `RANGE` partitions. In `RANGE` partitioning, a row generating an expression value that is equal to a limiting value in a `VALUES LESS THAN` is never placed in the corresponding partition; however, when using `RANGE COLUMNS` partitioning, it is sometimes possible for a row whose partitioning column list's first element is equal in value to the that of the first element in a `VALUES LESS THAN` value list to be placed in the corresponding partition.

Consider the `RANGE` partitioned table created by this statement:

```
CREATE TABLE r1 (
 a INT,
 b INT
)
PARTITION BY RANGE (a) (
 PARTITION p0 VALUES LESS THAN (5),
 PARTITION p1 VALUES LESS THAN (MAXVALUE)
```

```
) ;
```

If we insert 3 rows into this table such that the column value for `a` is 5 for each row, all 3 rows are stored in partition `p1` because the `a` column value is in each case not less than 5, as we can see by executing the proper query against the Information Schema `PARTITIONS` table:

```
mysql> INSERT INTO r1 VALUES (5,10), (5,11), (5,12);
Query OK, 3 rows affected (0.00 sec)
Records: 3 Duplicates: 0 Warnings: 0

mysql> SELECT PARTITION_NAME, TABLE_ROWS
 -> FROM INFORMATION_SCHEMA.PARTITIONS
 -> WHERE TABLE_NAME = 'r1';
+-----+-----+
| PARTITION_NAME | TABLE_ROWS |
+-----+-----+
| p0 | 0 |
| p1 | 3 |
+-----+-----+
2 rows in set (0.00 sec)
```

Now consider a similar table `rc1` that uses `RANGE COLUMNS` partitioning with both columns `a` and `b` referenced in the `COLUMNS` clause, created as shown here:

```
CREATE TABLE rc1 (
 a INT,
 b INT
)
PARTITION BY RANGE COLUMNS(a, b) (
 PARTITION p0 VALUES LESS THAN (5, 12),
 PARTITION p3 VALUES LESS THAN (MAXVALUE, MAXVALUE)
);
```

If we insert exactly the same rows into `rc1` as we just inserted into `r1`, the distribution of the rows is quite different:

```
mysql> INSERT INTO rc1 VALUES (5,10), (5,11), (5,12);
Query OK, 3 rows affected (0.00 sec)
Records: 3 Duplicates: 0 Warnings: 0

mysql> SELECT PARTITION_NAME, TABLE_ROWS
 -> FROM INFORMATION_SCHEMA.PARTITIONS
 -> WHERE TABLE_NAME = 'rc1';
+-----+-----+
| PARTITION_NAME | TABLE_ROWS |
+-----+-----+
| p0 | 2 |
| p3 | 1 |
+-----+-----+
2 rows in set (0.00 sec)
```

This is because we are comparing rows rather than scalar values. We can compare the row values inserted with the limiting row value from the `VALUES THAN LESS THAN` clause used to define partition `p0` in table `rc1`, like this:

```
mysql> SELECT (5,10) < (5,12), (5,11) < (5,12), (5,12) < (5,12);
+-----+-----+-----+
| (5,10) < (5,12) | (5,11) < (5,12) | (5,12) < (5,12) |
+-----+-----+-----+
| 1 | 1 | 0 |
+-----+-----+-----+
1 row in set (0.00 sec)
```

The 2 tuples `(5,10)` and `(5,11)` evaluate as less than `(5,12)`, so they are stored in partition `p0`. Since 5 is not less than 5 and 12 is not less than 12, `(5,12)` is considered not less than `(5,12)`, and is stored in partition `p1`.

The `SELECT` statement in the preceding example could also have been written using explicit row constructors, like this:

```
SELECT ROW(5,10) < ROW(5,12), ROW(5,11) < ROW(5,12), ROW(5,12) < ROW(5,13);
```

For more information about the use of row constructors in MySQL, see [Section 15.2.15.5, “Row Subqueries”](#).

For a table partitioned by `RANGE COLUMNS` using only a single partitioning column, the storing of rows in partitions is the same as that of an equivalent table that is partitioned by `RANGE`. The following `CREATE TABLE` statement creates a table partitioned by `RANGE COLUMNS` using 1 partitioning column:

```
CREATE TABLE rx (
 a INT,
 b INT
)
PARTITION BY RANGE COLUMNS (a) (
 PARTITION p0 VALUES LESS THAN (5),
 PARTITION p1 VALUES LESS THAN (MAXVALUE)
);
```

If we insert the rows `(5,10)`, `(5,11)`, and `(5,12)` into this table, we can see that their placement is the same as it is for the table `r` we created and populated earlier:

```
mysql> INSERT INTO rx VALUES (5,10), (5,11), (5,12);
Query OK, 3 rows affected (0.00 sec)
Records: 3 Duplicates: 0 Warnings: 0

mysql> SELECT PARTITION_NAME, TABLE_ROWS
 -> FROM INFORMATION_SCHEMA.PARTITIONS
 -> WHERE TABLE_NAME = 'rx';
+-----+-----+
| PARTITION_NAME | TABLE_ROWS |
+-----+-----+
| p0 | 0 |
| p1 | 3 |
+-----+-----+
2 rows in set (0.00 sec)
```

It is also possible to create tables partitioned by `RANGE COLUMNS` where limiting values for one or more columns are repeated in successive partition definitions. You can do this as long as the tuples of column values used to define the partitions are strictly increasing. For example, each of the following `CREATE TABLE` statements is valid:

```
CREATE TABLE rc2 (
 a INT,
 b INT
)
PARTITION BY RANGE COLUMNS(a,b) (
 PARTITION p0 VALUES LESS THAN (0,10),
 PARTITION p1 VALUES LESS THAN (10,20),
 PARTITION p2 VALUES LESS THAN (10,30),
 PARTITION p3 VALUES LESS THAN (MAXVALUE,MAXVALUE)
);

CREATE TABLE rc3 (
 a INT,
 b INT
)
PARTITION BY RANGE COLUMNS(a,b) (
 PARTITION p0 VALUES LESS THAN (0,10),
 PARTITION p1 VALUES LESS THAN (10,20),
 PARTITION p2 VALUES LESS THAN (10,30),
 PARTITION p3 VALUES LESS THAN (10,35),
 PARTITION p4 VALUES LESS THAN (20,40),
 PARTITION p5 VALUES LESS THAN (MAXVALUE,MAXVALUE)
);
```

The following statement also succeeds, even though it might appear at first glance that it would not, since the limiting value of column `b` is 25 for partition `p0` and 20 for partition `p1`, and the limiting value of column `c` is 100 for partition `p1` and 50 for partition `p2`:

```
CREATE TABLE rc4 (
 a INT,
 b INT,
 c INT
)
PARTITION BY RANGE COLUMNS(a,b,c) (
 PARTITION p0 VALUES LESS THAN (0,25,50),
 PARTITION p1 VALUES LESS THAN (10,20,100),
 PARTITION p2 VALUES LESS THAN (10,30,50),
 PARTITION p3 VALUES LESS THAN (MAXVALUE,MAXVALUE,MAXVALUE)
);
```

When designing tables partitioned by `RANGE COLUMNS`, you can always test successive partition definitions by comparing the desired tuples using the `mysql` client, like this:

```
mysql> SELECT (0,25,50) < (10,20,100), (10,20,100) < (10,30,50);
+-----+-----+
| (0,25,50) < (10,20,100) | (10,20,100) < (10,30,50) |
+-----+-----+
| 1 | 1 |
+-----+-----+
1 row in set (0.00 sec)
```

If a `CREATE TABLE` statement contains partition definitions that are not in strictly increasing order, it fails with an error, as shown in this example:

```
mysql> CREATE TABLE rcf (
 --> a INT,
 --> b INT,
 --> c INT
 -->)
 --> PARTITION BY RANGE COLUMNS(a,b,c) (
 --> PARTITION p0 VALUES LESS THAN (0,25,50),
 --> PARTITION p1 VALUES LESS THAN (20,20,100),
 --> PARTITION p2 VALUES LESS THAN (10,30,50),
 --> PARTITION p3 VALUES LESS THAN (MAXVALUE,MAXVALUE,MAXVALUE)
 -->);
ERROR 1493 (HY000): VALUES LESS THAN value must be strictly increasing for each partition
```

When you get such an error, you can deduce which partition definitions are invalid by making “less than” comparisons between their column lists. In this case, the problem is with the definition of partition `p2` because the tuple used to define it is not less than the tuple used to define partition `p3`, as shown here:

```
mysql> SELECT (0,25,50) < (20,20,100), (20,20,100) < (10,30,50);
+-----+-----+
| (0,25,50) < (20,20,100) | (20,20,100) < (10,30,50) |
+-----+-----+
| 1 | 0 |
+-----+-----+
1 row in set (0.00 sec)
```

It is also possible for `MAXVALUE` to appear for the same column in more than one `VALUES LESS THAN` clause when using `RANGE COLUMNS`. However, the limiting values for individual columns in successive partition definitions should otherwise be increasing, there should be no more than one partition defined where `MAXVALUE` is used as the upper limit for all column values, and this partition definition should appear last in the list of `PARTITION ... VALUES LESS THAN` clauses. In addition, you cannot use `MAXVALUE` as the limiting value for the first column in more than one partition definition.

As stated previously, it is also possible with `RANGE COLUMNS` partitioning to use non-integer columns as partitioning columns. (See [Section 26.2.3, “COLUMNS Partitioning”](#), for a complete listing of these.) Consider a table named `employees` (which is not partitioned), created using the following statement:

```
CREATE TABLE employees (
 id INT NOT NULL,
 fname VARCHAR(30),
 lname VARCHAR(30),
 hired DATE NOT NULL DEFAULT '1970-01-01',
 separated DATE NOT NULL DEFAULT '9999-12-31',
```

```
 job_code INT NOT NULL,
 store_id INT NOT NULL
);
```

Using `RANGE COLUMNS` partitioning, you can create a version of this table that stores each row in one of four partitions based on the employee's last name, like this:

```
CREATE TABLE employees_by_lname (
 id INT NOT NULL,
 fname VARCHAR(30),
 lname VARCHAR(30),
 hired DATE NOT NULL DEFAULT '1970-01-01',
 separated DATE NOT NULL DEFAULT '9999-12-31',
 job_code INT NOT NULL,
 store_id INT NOT NULL
)
PARTITION BY RANGE COLUMNS (lname) (
 PARTITION p0 VALUES LESS THAN ('g'),
 PARTITION p1 VALUES LESS THAN ('m'),
 PARTITION p2 VALUES LESS THAN ('t'),
 PARTITION p3 VALUES LESS THAN (MAXVALUE)
);
```

Alternatively, you could cause the `employees` table as created previously to be partitioned using this scheme by executing the following `ALTER TABLE` statement:

```
ALTER TABLE employees PARTITION BY RANGE COLUMNS (lname) (
 PARTITION p0 VALUES LESS THAN ('g'),
 PARTITION p1 VALUES LESS THAN ('m'),
 PARTITION p2 VALUES LESS THAN ('t'),
 PARTITION p3 VALUES LESS THAN (MAXVALUE)
);
```

### Note

Because different character sets and collations have different sort orders, the character sets and collations in use may effect which partition of a table partitioned by `RANGE COLUMNS` a given row is stored in when using string columns as partitioning columns. In addition, changing the character set or collation for a given database, table, or column after such a table is created may cause changes in how rows are distributed. For example, when using a case-sensitive collation, '`and`' sorts before '`Andersen`', but when using a collation that is case-insensitive, the reverse is true.

For information about how MySQL handles character sets and collations, see [Chapter 12, Character Sets, Collations, Unicode](#).

Similarly, you can cause the `employees` table to be partitioned in such a way that each row is stored in one of several partitions based on the decade in which the corresponding employee was hired using the `ALTER TABLE` statement shown here:

```
ALTER TABLE employees PARTITION BY RANGE COLUMNS (hired) (
 PARTITION p0 VALUES LESS THAN ('1970-01-01'),
 PARTITION p1 VALUES LESS THAN ('1980-01-01'),
 PARTITION p2 VALUES LESS THAN ('1990-01-01'),
 PARTITION p3 VALUES LESS THAN ('2000-01-01'),
 PARTITION p4 VALUES LESS THAN ('2010-01-01'),
 PARTITION p5 VALUES LESS THAN (MAXVALUE)
);
```

See [Section 15.1.20, “CREATE TABLE Statement”](#), for additional information about `PARTITION BY RANGE COLUMNS` syntax.

### 26.2.3.2 LIST COLUMNS partitioning

MySQL 8.4 provides support for `LIST COLUMNS` partitioning. This is a variant of `LIST` partitioning that enables the use of multiple columns as partition keys, and for columns of data types other than

integer types to be used as partitioning columns; you can use string types, `DATE`, and `DATETIME` columns. (For more information about permitted data types for `COLUMNS` partitioning columns, see [Section 26.2.3, “COLUMNS Partitioning”](#).)

Suppose that you have a business that has customers in 12 cities which, for sales and marketing purposes, you organize into 4 regions of 3 cities each as shown in the following table:

Region	Cities
1	Oskarshamn, Högsby, Mönsterås
2	Vimmerby, Hultsfred, Västervik
3	Nässjö, Eksjö, Vetlanda
4	Uppvidinge, Alvesta, Växjo

With `LIST COLUMNS` partitioning, you can create a table for customer data that assigns a row to any of 4 partitions corresponding to these regions based on the name of the city where a customer resides, as shown here:

```
CREATE TABLE customers_1 (
 first_name VARCHAR(25),
 last_name VARCHAR(25),
 street_1 VARCHAR(30),
 street_2 VARCHAR(30),
 city VARCHAR(15),
 renewal DATE
)
PARTITION BY LIST COLUMNS(city) (
 PARTITION pRegion_1 VALUES IN('Oskarshamn', 'Högsby', 'Mönsterås'),
 PARTITION pRegion_2 VALUES IN('Vimmerby', 'Hultsfred', 'Västervik'),
 PARTITION pRegion_3 VALUES IN('Nässjö', 'Eksjö', 'Vetlanda'),
 PARTITION pRegion_4 VALUES IN('Uppvidinge', 'Alvesta', 'Växjo')
);
```

As with partitioning by `RANGE COLUMNS`, you do not need to use expressions in the `COLUMNS()` clause to convert column values into integers. (In fact, the use of expressions other than column names is not permitted with `COLUMNS()`.)

It is also possible to use `DATE` and `DATETIME` columns, as shown in the following example that uses the same name and columns as the `customers_1` table shown previously, but employs `LIST COLUMNS` partitioning based on the `renewal` column to store rows in one of 4 partitions depending on the week in February 2010 the customer's account is scheduled to renew:

```
CREATE TABLE customers_2 (
 first_name VARCHAR(25),
 last_name VARCHAR(25),
 street_1 VARCHAR(30),
 street_2 VARCHAR(30),
 city VARCHAR(15),
 renewal DATE
)
PARTITION BY LIST COLUMNS(renewal) (
 PARTITION pWeek_1 VALUES IN('2010-02-01', '2010-02-02', '2010-02-03',
 '2010-02-04', '2010-02-05', '2010-02-06', '2010-02-07'),
 PARTITION pWeek_2 VALUES IN('2010-02-08', '2010-02-09', '2010-02-10',
 '2010-02-11', '2010-02-12', '2010-02-13', '2010-02-14'),
 PARTITION pWeek_3 VALUES IN('2010-02-15', '2010-02-16', '2010-02-17',
 '2010-02-18', '2010-02-19', '2010-02-20', '2010-02-21'),
 PARTITION pWeek_4 VALUES IN('2010-02-22', '2010-02-23', '2010-02-24',
 '2010-02-25', '2010-02-26', '2010-02-27', '2010-02-28')
);
```

This works, but becomes cumbersome to define and maintain if the number of dates involved grows very large; in such cases, it is usually more practical to employ `RANGE` or `RANGE COLUMNS` partitioning instead. In this case, since the column we wish to use as the partitioning key is a `DATE` column, we use `RANGE COLUMNS` partitioning, as shown here:

```

CREATE TABLE customers_3 (
 first_name VARCHAR(25),
 last_name VARCHAR(25),
 street_1 VARCHAR(30),
 street_2 VARCHAR(30),
 city VARCHAR(15),
 renewal DATE
)
PARTITION BY RANGE COLUMNS(renewal) (
 PARTITION pWeek_1 VALUES LESS THAN('2010-02-09'),
 PARTITION pWeek_2 VALUES LESS THAN('2010-02-15'),
 PARTITION pWeek_3 VALUES LESS THAN('2010-02-22'),
 PARTITION pWeek_4 VALUES LESS THAN('2010-03-01')
);

```

See [Section 26.2.3.1, “RANGE COLUMNS partitioning”](#), for more information.

In addition (as with `RANGE COLUMNS` partitioning), you can use multiple columns in the `COLUMNS()` clause.

See [Section 15.1.20, “CREATE TABLE Statement”](#), for additional information about `PARTITION BY LIST COLUMNS()` syntax.

## 26.2.4 HASH Partitioning

Partitioning by `HASH` is used primarily to ensure an even distribution of data among a predetermined number of partitions. With range or list partitioning, you must specify explicitly which partition a given column value or set of column values should be stored in; with hash partitioning, this decision is taken care of for you, and you need only specify a column value or expression based on a column value to be hashed and the number of partitions into which the partitioned table is to be divided.

To partition a table using `HASH` partitioning, it is necessary to append to the `CREATE TABLE` statement a `PARTITION BY HASH(expr)` clause, where `expr` is an expression that returns an integer. This can simply be the name of a column whose type is one of MySQL's integer types. In addition, you most likely want to follow this with `PARTITIONS num`, where `num` is a positive integer representing the number of partitions into which the table is to be divided.

### Note

For simplicity, the tables in the examples that follow do not use any keys. You should be aware that, if a table has any unique keys, every column used in the partitioning expression for this table must be part of every unique key, including the primary key. See [Section 26.6.1, “Partitioning Keys, Primary Keys, and Unique Keys”](#), for more information.

The following statement creates a table that uses hashing on the `store_id` column and is divided into 4 partitions:

```

CREATE TABLE employees (
 id INT NOT NULL,
 fname VARCHAR(30),
 lname VARCHAR(30),
 hired DATE NOT NULL DEFAULT '1970-01-01',
 separated DATE NOT NULL DEFAULT '9999-12-31',
 job_code INT,
 store_id INT
)
PARTITION BY HASH(store_id)
PARTITIONS 4;

```

If you do not include a `PARTITIONS` clause, the number of partitions defaults to 1; using the `PARTITIONS` keyword without a number following it results in a syntax error.

You can also use an SQL expression that returns an integer for `expr`. For instance, you might want to partition based on the year in which an employee was hired. This can be done as shown here:

```

CREATE TABLE employees (
 id INT NOT NULL,
 fname VARCHAR(30),
 lname VARCHAR(30),
 hired DATE NOT NULL DEFAULT '1970-01-01',
 separated DATE NOT NULL DEFAULT '9999-12-31',
 job_code INT,
 store_id INT
)
PARTITION BY HASH(YEAR(hired))
PARTITIONS 4;

```

`expr` must return a nonconstant, nonrandom integer value (in other words, it should be varying but deterministic), and must not contain any prohibited constructs as described in [Section 26.6, “Restrictions and Limitations on Partitioning”](#). You should also keep in mind that this expression is evaluated each time a row is inserted or updated (or possibly deleted); this means that very complex expressions may give rise to performance issues, particularly when performing operations (such as batch inserts) that affect a great many rows at one time.

The most efficient hashing function is one which operates upon a single table column and whose value increases or decreases consistently with the column value, as this allows for “pruning” on ranges of partitions. That is, the more closely that the expression varies with the value of the column on which it is based, the more efficiently MySQL can use the expression for hash partitioning.

For example, where `date_col` is a column of type `DATE`, then the expression `TO_DAYS(date_col)` is said to vary directly with the value of `date_col`, because for every change in the value of `date_col`, the value of the expression changes in a consistent manner. The variance of the expression `YEAR(date_col)` with respect to `date_col` is not quite as direct as that of `TO_DAYS(date_col)`, because not every possible change in `date_col` produces an equivalent change in `YEAR(date_col)`. Even so, `YEAR(date_col)` is a good candidate for a hashing function, because it varies directly with a portion of `date_col` and there is no possible change in `date_col` that produces a disproportionate change in `YEAR(date_col)`.

By way of contrast, suppose that you have a column named `int_col` whose type is `INT`. Now consider the expression `POW(5-int_col, 3) + 6`. This would be a poor choice for a hashing function because a change in the value of `int_col` is not guaranteed to produce a proportional change in the value of the expression. Changing the value of `int_col` by a given amount can produce widely differing changes in the value of the expression. For example, changing `int_col` from 5 to 6 produces a change of -1 in the value of the expression, but changing the value of `int_col` from 6 to 7 produces a change of -7 in the expression value.

In other words, the more closely the graph of the column value versus the value of the expression follows a straight line as traced by the equation  $y=cx$  where  $c$  is some nonzero constant, the better the expression is suited to hashing. This has to do with the fact that the more nonlinear an expression is, the more uneven the distribution of data among the partitions it tends to produce.

In theory, pruning is also possible for expressions involving more than one column value, but determining which of such expressions are suitable can be quite difficult and time-consuming. For this reason, the use of hashing expressions involving multiple columns is not particularly recommended.

When `PARTITION BY HASH` is used, the storage engine determines which partition of `num` partitions to use based on the modulus of the result of the expression. In other words, for a given expression `expr`, the partition in which the record is stored is partition number `N`, where `N = MOD(expr, num)`. Suppose that table `t1` is defined as follows, so that it has 4 partitions:

```

CREATE TABLE t1 (col1 INT, col2 CHAR(5), col3 DATE)
 PARTITION BY HASH(YEAR(col3))
 PARTITIONS 4;

```

If you insert a record into `t1` whose `col3` value is '2005-09-15', then the partition in which it is stored is determined as follows:

```

MOD(YEAR('2005-09-01'), 4)
= MOD(2005, 4)

```

```
= 1
```

MySQL 8.4 also supports a variant of `HASH` partitioning known as *linear hashing* which employs a more complex algorithm for determining the placement of new rows inserted into the partitioned table. See [Section 26.2.4.1, “LINEAR HASH Partitioning”](#), for a description of this algorithm.

The user-supplied expression is evaluated each time a record is inserted or updated. It may also—depending on the circumstances—be evaluated when records are deleted.

#### 26.2.4.1 LINEAR HASH Partitioning

MySQL also supports linear hashing, which differs from regular hashing in that linear hashing utilizes a linear powers-of-two algorithm whereas regular hashing employs the modulus of the hashing function's value.

Syntactically, the only difference between linear-hash partitioning and regular hashing is the addition of the `LINEAR` keyword in the `PARTITION BY` clause, as shown here:

```
CREATE TABLE employees (
 id INT NOT NULL,
 fname VARCHAR(30),
 lname VARCHAR(30),
 hired DATE NOT NULL DEFAULT '1970-01-01',
 separated DATE NOT NULL DEFAULT '9999-12-31',
 job_code INT,
 store_id INT
)
PARTITION BY LINEAR HASH(YEAR(hired))
PARTITIONS 4;
```

Given an expression `expr`, the partition in which the record is stored when linear hashing is used is partition number `N` from among `num` partitions, where `N` is derived according to the following algorithm:

1. Find the next power of 2 greater than `num`. We call this value `V`; it can be calculated as:

```
V = POWER(2, CEILING(LOG(2, num)))
```

(Suppose that `num` is 13. Then `LOG(2, 13)` is 3.7004397181411. `CEILING(3.7004397181411)` is 4, and `V = POWER(2, 4)`, which is 16.)

2. Set `N = F(column_list) & (V - 1)`.
3. While `N >= num`:
  - Set `V = V / 2`
  - Set `N = N & (V - 1)`

Suppose that the table `t1`, using linear hash partitioning and having 6 partitions, is created using this statement:

```
CREATE TABLE t1 (col1 INT, col2 CHAR(5), col3 DATE)
 PARTITION BY LINEAR HASH(YEAR(col3))
 PARTITIONS 6;
```

Now assume that you want to insert two records into `t1` having the `col3` column values '`2003-04-14`' and '`1998-10-19`'. The partition number for the first of these is determined as follows:

```
V = POWER(2, CEILING(LOG(2,6))) = 8
N = YEAR('2003-04-14') & (8 - 1)
 = 2003 & 7
 = 3

(3 >= 6 is FALSE: record stored in partition #3)
```

The number of the partition where the second record is stored is calculated as shown here:

```

V = 8
N = YEAR('1998-10-19') & (8 - 1)
= 1998 & 7
= 6

(6 >= 6 is TRUE: additional step required)

N = 6 & ((8 / 2) - 1)
= 6 & 3
= 2

(2 >= 6 is FALSE: record stored in partition #2)

```

The advantage in partitioning by linear hash is that the adding, dropping, merging, and splitting of partitions is made much faster, which can be beneficial when dealing with tables containing extremely large amounts (terabytes) of data. The disadvantage is that data is less likely to be evenly distributed between partitions as compared with the distribution obtained using regular hash partitioning.

## 26.2.5 KEY Partitioning

Partitioning by key is similar to partitioning by hash, except that where hash partitioning employs a user-defined expression, the hashing function for key partitioning is supplied by the MySQL server. NDB Cluster uses `MD5()` for this purpose; for tables using other storage engines, the server employs its own internal hashing function.

The syntax rules for `CREATE TABLE ... PARTITION BY KEY` are similar to those for creating a table that is partitioned by hash. The major differences are listed here:

- `KEY` is used rather than `HASH`.
- `KEY` takes only a list of zero or more column names. Any columns used as the partitioning key must comprise part or all of the table's primary key, if the table has one. Where no column name is specified as the partitioning key, the table's primary key is used, if there is one. For example, the following `CREATE TABLE` statement is valid in MySQL 8.4:

```

CREATE TABLE k1 (
 id INT NOT NULL PRIMARY KEY,
 name VARCHAR(20)
)
PARTITION BY KEY()
PARTITIONS 2;

```

If there is no primary key but there is a unique key, then the unique key is used for the partitioning key:

```

CREATE TABLE k1 (
 id INT NOT NULL,
 name VARCHAR(20),
 UNIQUE KEY (id)
)
PARTITION BY KEY()
PARTITIONS 2;

```

However, if the unique key column were not defined as `NOT NULL`, then the previous statement would fail.

In both of these cases, the partitioning key is the `id` column, even though it is not shown in the output of `SHOW CREATE TABLE` or in the `PARTITION_EXPRESSION` column of the Information Schema `PARTITIONS` table.

Unlike the case with other partitioning types, columns used for partitioning by `KEY` are not restricted to integer or `NULL` values. For example, the following `CREATE TABLE` statement is valid:

```

CREATE TABLE tml (
 s1 CHAR(32) PRIMARY KEY
)

```

```
PARTITION BY KEY(s1)
PARTITIONS 10;
```

The preceding statement would *not* be valid, were a different partitioning type to be specified. (In this case, simply using `PARTITION BY KEY()` would also be valid and have the same effect as `PARTITION BY KEY(s1)`, since `s1` is the table's primary key.)

For additional information about this issue, see [Section 26.6, “Restrictions and Limitations on Partitioning”](#).

Columns with index prefixes are not supported in partitioning keys. This means that `CHAR`, `VARCHAR`, `BINARY`, and `VARBINARY` columns can be used in a partitioning key, as long as they do not employ prefixes; because a prefix must be specified for `BLOB` and `TEXT` columns in index definitions, it is not possible to use columns of these two types in partitioning keys. In older versions of MySQL, columns using prefixes were permitted when creating, altering, or upgrading a partitioned table, even though they were not included in the table's partitioning key; in MySQL 8.4, this is no longer allowed deprecate, and the server rejects any `CREATE TABLE` or `ALTER TABLE` statement affecting a partitioned table in which one or more columns using prefixes occur with an error. See [Column index prefixes not supported for key partitioning](#).

#### Note

Tables using the `NDB` storage engine are implicitly partitioned by `KEY`, using the table's primary key as the partitioning key (as with other MySQL storage engines). In the event that the `NDB` Cluster table has no explicit primary key, the “hidden” primary key generated by the `NDB` storage engine for each `NDB` Cluster table is used as the partitioning key.

If you define an explicit partitioning scheme for an `NDB` table, the table must have an explicit primary key, and any columns used in the partitioning expression must be part of this key. However, if the table uses an “empty” partitioning expression—that is, `PARTITION BY KEY()` with no column references—then no explicit primary key is required.

You can observe this partitioning using the `ndb_desc` utility (with the `-p` option).

#### Important

For a key-partitioned table, you cannot execute an `ALTER TABLE DROP PRIMARY KEY`, as doing so generates the error `ERROR 1466 (HY000) : Field in list of fields for partition function not found in table`. This is not an issue for `NDB` Cluster tables which are partitioned by `KEY`; in such cases, the table is reorganized using the “hidden” primary key as the table's new partitioning key. See [Chapter 25, MySQL NDB Cluster 8.4](#).

It is also possible to partition a table by linear key. Here is a simple example:

```
CREATE TABLE tk (
 col1 INT NOT NULL,
 col2 CHAR(5),
 col3 DATE
)
PARTITION BY LINEAR KEY (col1)
PARTITIONS 3;
```

The `LINEAR` keyword has the same effect on `KEY` partitioning as it does on `HASH` partitioning, with the partition number being derived using a powers-of-two algorithm rather than modulo arithmetic. See [Section 26.2.4.1, “LINEAR HASH Partitioning”](#), for a description of this algorithm and its implications.

## 26.2.6 Subpartitioning

Subpartitioning—also known as *composite partitioning*—is the further division of each partition in a partitioned table. Consider the following `CREATE TABLE` statement:

```
CREATE TABLE ts (id INT, purchased DATE)
 PARTITION BY RANGE(YEAR(purchased))
 SUBPARTITION BY HASH(TO_DAYS(purchased))
 SUBPARTITIONS 2 (
 PARTITION p0 VALUES LESS THAN (1990),
 PARTITION p1 VALUES LESS THAN (2000),
 PARTITION p2 VALUES LESS THAN MAXVALUE
);

```

Table `ts` has 3 `RANGE` partitions. Each of these partitions—`p0`, `p1`, and `p2`—is further divided into 2 subpartitions. In effect, the entire table is divided into  $3 * 2 = 6$  partitions. However, due to the action of the `PARTITION BY RANGE` clause, the first 2 of these store only those records with a value less than 1990 in the `purchased` column.

It is possible to subpartition tables that are partitioned by `RANGE` or `LIST`. Subpartitions may use either `HASH` or `KEY` partitioning. This is also known as *composite partitioning*.

### Note

`SUBPARTITION BY HASH` and `SUBPARTITION BY KEY` generally follow the same syntax rules as `PARTITION BY HASH` and `PARTITION BY KEY`, respectively. An exception to this is that `SUBPARTITION BY KEY` (unlike `PARTITION BY KEY`) does not currently support a default column, so the column used for this purpose must be specified, even if the table has an explicit primary key. This is a known issue which we are working to address; see [Issues with subpartitions](#), for more information and an example.

It is also possible to define subpartitions explicitly using `SUBPARTITION` clauses to specify options for individual subpartitions. For example, a more verbose fashion of creating the same table `ts` as shown in the previous example would be:

```
CREATE TABLE ts (id INT, purchased DATE)
 PARTITION BY RANGE(YEAR(purchased))
 SUBPARTITION BY HASH(TO_DAYS(purchased)) (
 PARTITION p0 VALUES LESS THAN (1990) (
 SUBPARTITION s0,
 SUBPARTITION s1
),
 PARTITION p1 VALUES LESS THAN (2000) (
 SUBPARTITION s2,
 SUBPARTITION s3
),
 PARTITION p2 VALUES LESS THAN MAXVALUE (
 SUBPARTITION s4,
 SUBPARTITION s5
)
);

```

Some syntactical items of note are listed here:

- Each partition must have the same number of subpartitions.
- If you explicitly define any subpartitions using `SUBPARTITION` on any partition of a partitioned table, you must define them all. In other words, the following statement fails:

```
CREATE TABLE ts (id INT, purchased DATE)
 PARTITION BY RANGE(YEAR(purchased))
 SUBPARTITION BY HASH(TO_DAYS(purchased)) (
 PARTITION p0 VALUES LESS THAN (1990) (
 SUBPARTITION s0,
 SUBPARTITION s1
),

```

```
PARTITION p1 VALUES LESS THAN (2000),
PARTITION p2 VALUES LESS THAN MAXVALUE (
 SUBPARTITION s2,
 SUBPARTITION s3
)
);
```

This statement would still fail even if it used `SUBPARTITIONS 2`.

- Each `SUBPARTITION` clause must include (at a minimum) a name for the subpartition. Otherwise, you may set any desired option for the subpartition or allow it to assume its default setting for that option.
- Subpartition names must be unique across the entire table. For example, the following `CREATE TABLE` statement is valid:

```
CREATE TABLE ts (id INT, purchased DATE)
 PARTITION BY RANGE(YEAR(purchased))
 SUBPARTITION BY HASH(TO_DAYS(purchased)) (
 PARTITION p0 VALUES LESS THAN (1990) (
 SUBPARTITION s0,
 SUBPARTITION s1
),
 PARTITION p1 VALUES LESS THAN (2000) (
 SUBPARTITION s2,
 SUBPARTITION s3
),
 PARTITION p2 VALUES LESS THAN MAXVALUE (
 SUBPARTITION s4,
 SUBPARTITION s5
)
);
)
```

## 26.2.7 How MySQL Partitioning Handles NULL

Partitioning in MySQL does nothing to disallow `NULL` as the value of a partitioning expression, whether it is a column value or the value of a user-supplied expression. Even though it is permitted to use `NULL` as the value of an expression that must otherwise yield an integer, it is important to keep in mind that `NULL` is not a number. MySQL's partitioning implementation treats `NULL` as being less than any non-`NULL` value, just as `ORDER BY` does.

This means that treatment of `NULL` varies between partitioning of different types, and may produce behavior which you do not expect if you are not prepared for it. This being the case, we discuss in this section how each MySQL partitioning type handles `NULL` values when determining the partition in which a row should be stored, and provide examples for each.

**Handling of NULL with RANGE partitioning.** If you insert a row into a table partitioned by `RANGE` such that the column value used to determine the partition is `NULL`, the row is inserted into the lowest partition. Consider these two tables in a database named `p`, created as follows:

```
mysql> CREATE TABLE t1 (
-> c1 INT,
-> c2 VARCHAR(20)
->)
-> PARTITION BY RANGE(c1) (
-> PARTITION p0 VALUES LESS THAN (0),
-> PARTITION p1 VALUES LESS THAN (10),
-> PARTITION p2 VALUES LESS THAN MAXVALUE
->);
Query OK, 0 rows affected (0.09 sec)

mysql> CREATE TABLE t2 (
-> c1 INT,
-> c2 VARCHAR(20)
->)
-> PARTITION BY RANGE(c1) (
-> PARTITION p0 VALUES LESS THAN (-5),
```

```

-> PARTITION p1 VALUES LESS THAN (0),
-> PARTITION p2 VALUES LESS THAN (10),
-> PARTITION p3 VALUES LESS THAN MAXVALUE
->);
Query OK, 0 rows affected (0.09 sec)

```

You can see the partitions created by these two `CREATE TABLE` statements using the following query against the `PARTITIONS` table in the `INFORMATION_SCHEMA` database:

```

mysql> SELECT TABLE_NAME, PARTITION_NAME, TABLE_ROWS, AVG_ROW_LENGTH, DATA_LENGTH
 > FROM INFORMATION_SCHEMA.PARTITIONS
 > WHERE TABLE_SCHEMA = 'p' AND TABLE_NAME LIKE 't_';
+-----+-----+-----+-----+-----+
| TABLE_NAME | PARTITION_NAME | TABLE_ROWS | AVG_ROW_LENGTH | DATA_LENGTH |
+-----+-----+-----+-----+-----+
| t1 | p0 | 0 | 0 | 0 |
| t1 | p1 | 0 | 0 | 0 |
| t1 | p2 | 0 | 0 | 0 |
| t2 | p0 | 0 | 0 | 0 |
| t2 | p1 | 0 | 0 | 0 |
| t2 | p2 | 0 | 0 | 0 |
| t2 | p3 | 0 | 0 | 0 |
+-----+-----+-----+-----+-----+
7 rows in set (0.00 sec)

```

(For more information about this table, see [Section 28.3.21, “The INFORMATION\\_SCHEMA PARTITIONS Table”](#).) Now let us populate each of these tables with a single row containing a `NULL` in the column used as the partitioning key, and verify that the rows were inserted using a pair of `SELECT` statements:

```

mysql> INSERT INTO t1 VALUES (NULL, 'mothra');
Query OK, 1 row affected (0.00 sec)

mysql> INSERT INTO t2 VALUES (NULL, 'mothra');
Query OK, 1 row affected (0.00 sec)

mysql> SELECT * FROM t1;
+-----+-----+
| id | name |
+-----+-----+
| NULL | mothra |
+-----+-----+
1 row in set (0.00 sec)

mysql> SELECT * FROM t2;
+-----+-----+
| id | name |
+-----+-----+
| NULL | mothra |
+-----+-----+
1 row in set (0.00 sec)

```

You can see which partitions are used to store the inserted rows by rerunning the previous query against `INFORMATION_SCHEMA.PARTITIONS` and inspecting the output:

```

mysql> SELECT TABLE_NAME, PARTITION_NAME, TABLE_ROWS, AVG_ROW_LENGTH, DATA_LENGTH
 > FROM INFORMATION_SCHEMA.PARTITIONS
 > WHERE TABLE_SCHEMA = 'p' AND TABLE_NAME LIKE 't_';
+-----+-----+-----+-----+-----+
| TABLE_NAME | PARTITION_NAME | TABLE_ROWS | AVG_ROW_LENGTH | DATA_LENGTH |
+-----+-----+-----+-----+-----+
| t1 | p0 | 1 | 20 | 20 |
| t1 | p1 | 0 | 0 | 0 |
| t1 | p2 | 0 | 0 | 0 |
| t2 | p0 | 1 | 20 | 20 |
| t2 | p1 | 0 | 0 | 0 |
| t2 | p2 | 0 | 0 | 0 |
| t2 | p3 | 0 | 0 | 0 |
+-----+-----+-----+-----+-----+
7 rows in set (0.01 sec)

```

You can also demonstrate that these rows were stored in the lowest-numbered partition of each table by dropping these partitions, and then re-running the `SELECT` statements:

```
mysql> ALTER TABLE t1 DROP PARTITION p0;
Query OK, 0 rows affected (0.16 sec)

mysql> ALTER TABLE t2 DROP PARTITION p0;
Query OK, 0 rows affected (0.16 sec)

mysql> SELECT * FROM t1;
Empty set (0.00 sec)

mysql> SELECT * FROM t2;
Empty set (0.00 sec)
```

(For more information on `ALTER TABLE ... DROP PARTITION`, see [Section 15.1.9, “ALTER TABLE Statement”](#).)

`NULL` is also treated in this way for partitioning expressions that use SQL functions. Suppose that we define a table using a `CREATE TABLE` statement such as this one:

```
CREATE TABLE tndate (
 id INT,
 dt DATE
)
PARTITION BY RANGE(YEAR(dt)) (
 PARTITION p0 VALUES LESS THAN (1990),
 PARTITION p1 VALUES LESS THAN (2000),
 PARTITION p2 VALUES LESS THAN MAXVALUE
);
```

As with other MySQL functions, `YEAR(NULL)` returns `NULL`. A row with a `dt` column value of `NULL` is treated as though the partitioning expression evaluated to a value less than any other value, and so is inserted into partition `p0`.

**Handling of NULL with LIST partitioning.** A table that is partitioned by `LIST` admits `NULL` values if and only if one of its partitions is defined using that value-list that contains `NULL`. The converse of this is that a table partitioned by `LIST` which does not explicitly use `NULL` in a value list rejects rows resulting in a `NULL` value for the partitioning expression, as shown in this example:

```
mysql> CREATE TABLE ts1 (
-> c1 INT,
-> c2 VARCHAR(20)
->)
-> PARTITION BY LIST(c1) (
-> PARTITION p0 VALUES IN (0, 3, 6),
-> PARTITION p1 VALUES IN (1, 4, 7),
-> PARTITION p2 VALUES IN (2, 5, 8)
->);
Query OK, 0 rows affected (0.01 sec)

mysql> INSERT INTO ts1 VALUES (9, 'mothra');
ERROR 1504 (HY000): Table has no partition for value 9

mysql> INSERT INTO ts1 VALUES (NULL, 'mothra');
ERROR 1504 (HY000): Table has no partition for value NULL
```

Only rows having a `c1` value between `0` and `8` inclusive can be inserted into `ts1`. `NULL` falls outside this range, just like the number `9`. We can create tables `ts2` and `ts3` having value lists containing `NULL`, as shown here:

```
mysql> CREATE TABLE ts2 (
-> c1 INT,
-> c2 VARCHAR(20)
->)
-> PARTITION BY LIST(c1) (
-> PARTITION p0 VALUES IN (0, 3, 6),
-> PARTITION p1 VALUES IN (1, 4, 7),
-> PARTITION p2 VALUES IN (2, 5, 8),
```

```

--> PARTITION p3 VALUES IN (NULL)
-->);
Query OK, 0 rows affected (0.01 sec)

mysql> CREATE TABLE ts3 (
--> c1 INT,
--> c2 VARCHAR(20)
-->)
--> PARTITION BY LIST(c1) (
--> PARTITION p0 VALUES IN (0, 3, 6),
--> PARTITION p1 VALUES IN (1, 4, 7, NULL),
--> PARTITION p2 VALUES IN (2, 5, 8)
-->);
Query OK, 0 rows affected (0.01 sec)

```

When defining value lists for partitioning, you can (and should) treat `NULL` just as you would any other value. For example, both `VALUES IN (NULL)` and `VALUES IN (1, 4, 7, NULL)` are valid, as are `VALUES IN (1, NULL, 4, 7)`, `VALUES IN (NULL, 1, 4, 7)`, and so on. You can insert a row having `NULL` for column `c1` into each of the tables `ts2` and `ts3`:

```

mysql> INSERT INTO ts2 VALUES (NULL, 'mothra');
Query OK, 1 row affected (0.00 sec)

mysql> INSERT INTO ts3 VALUES (NULL, 'mothra');
Query OK, 1 row affected (0.00 sec)

```

By issuing the appropriate query against `INFORMATION_SCHEMA.PARTITIONS`, you can determine which partitions were used to store the rows just inserted (we assume, as in the previous examples, that the partitioned tables were created in the `p` database):

```

mysql> SELECT TABLE_NAME, PARTITION_NAME, TABLE_ROWS, AVG_ROW_LENGTH, DATA_LENGTH
 > FROM INFORMATION_SCHEMA.PARTITIONS
 > WHERE TABLE_SCHEMA = 'p' AND TABLE_NAME LIKE 'ts_';
+-----+-----+-----+-----+-----+
| TABLE_NAME | PARTITION_NAME | TABLE_ROWS | AVG_ROW_LENGTH | DATA_LENGTH |
+-----+-----+-----+-----+-----+
| ts2 | p0 | 0 | 0 | 0 |
| ts2 | p1 | 0 | 0 | 0 |
| ts2 | p2 | 0 | 0 | 0 |
| / ts2 | / p3 | 1 | 20 | 20 |
| ts3 | p0 | 0 | 0 | 0 |
| / ts3 | / p1 | 1 | 20 | 20 |
| ts3 | p2 | 0 | 0 | 0 |
+-----+-----+-----+-----+-----+
7 rows in set (0.01 sec)

```

As shown earlier in this section, you can also verify which partitions were used for storing the rows by deleting these partitions and then performing a `SELECT`.

**Handling of NULL with HASH and KEY partitioning.** `NULL` is handled somewhat differently for tables partitioned by `HASH` or `KEY`. In these cases, any partition expression that yields a `NULL` value is treated as though its return value were zero. We can verify this behavior by examining the effects on the file system of creating a table partitioned by `HASH` and populating it with a record containing appropriate values. Suppose that you have a table `th` (also in the `p` database) created using the following statement:

```

mysql> CREATE TABLE th (
--> c1 INT,
--> c2 VARCHAR(20)
-->)
--> PARTITION BY HASH(c1)
--> PARTITIONS 2;
Query OK, 0 rows affected (0.00 sec)

```

The partitions belonging to this table can be viewed using the query shown here:

```

mysql> SELECT TABLE_NAME, PARTITION_NAME, TABLE_ROWS, AVG_ROW_LENGTH, DATA_LENGTH
 > FROM INFORMATION_SCHEMA.PARTITIONS
 > WHERE TABLE_SCHEMA = 'p' AND TABLE_NAME = 'th';

```

TABLE_NAME	PARTITION_NAME	TABLE_ROWS	AVG_ROW_LENGTH	DATA_LENGTH
th	p0	0	0	0
th	p1	0	0	0

2 rows in set (0.00 sec)

`TABLE_ROWS` for each partition is 0. Now insert two rows into `th` whose `c1` column values are `NULL` and 0, and verify that these rows were inserted, as shown here:

```
mysql> INSERT INTO th VALUES (NULL, 'mothra'), (0, 'gigan');
Query OK, 1 row affected (0.00 sec)

mysql> SELECT * FROM th;
+---+---+
| c1 | c2 |
+---+---+
| NULL | mothra |
+---+---+
| 0 | gigan |
+---+---+
2 rows in set (0.01 sec)
```

Recall that for any integer `N`, the value of `NULL MOD N` is always `NULL`. For tables that are partitioned by `HASH` or `KEY`, this result is treated for determining the correct partition as 0. Checking the Information Schema `PARTITIONS` table once again, we can see that both rows were inserted into partition `p0`:

```
mysql> SELECT TABLE_NAME, PARTITION_NAME, TABLE_ROWS, AVG_ROW_LENGTH, DATA_LENGTH
 > FROM INFORMATION_SCHEMA.PARTITIONS
 > WHERE TABLE_SCHEMA = 'p' AND TABLE_NAME = 'th';
+-----+-----+-----+-----+-----+
| TABLE_NAME | PARTITION_NAME | TABLE_ROWS | AVG_ROW_LENGTH | DATA_LENGTH |
+-----+-----+-----+-----+-----+
| th | p0 | 2 | 20 | 20 |
| th | p1 | 0 | 0 | 0 |
+-----+-----+-----+-----+-----+
2 rows in set (0.00 sec)
```

By repeating the last example using `PARTITION BY KEY` in place of `PARTITION BY HASH` in the definition of the table, you can verify that `NULL` is also treated like 0 for this type of partitioning.

## 26.3 Partition Management

There are a number of ways using SQL statements to modify partitioned tables; it is possible to add, drop, redefine, merge, or split existing partitions using the partitioning extensions to the `ALTER TABLE` statement. There are also ways to obtain information about partitioned tables and partitions. We discuss these topics in the sections that follow.

- For information about partition management in tables partitioned by `RANGE` or `LIST`, see [Section 26.3.1, “Management of RANGE and LIST Partitions”](#).
- For a discussion of managing `HASH` and `KEY` partitions, see [Section 26.3.2, “Management of HASH and KEY Partitions”](#).
- See [Section 26.3.5, “Obtaining Information About Partitions”](#), for a discussion of mechanisms provided in MySQL 8.4 for obtaining information about partitioned tables and partitions.
- For a discussion of performing maintenance operations on partitions, see [Section 26.3.4, “Maintenance of Partitions”](#).

### Note

All partitions of a partitioned table must have the same number of subpartitions; it is not possible to change the subpartitioning once the table has been created.

To change a table's partitioning scheme, it is necessary only to use the `ALTER TABLE` statement with a `partition_options` option, which has the same syntax as that as used with `CREATE TABLE` for creating a partitioned table; this option (also) always begins with the keywords `PARTITION BY`. Suppose that the following `CREATE TABLE` statement was used to create a table that is partitioned by range:

```
CREATE TABLE trb3 (id INT, name VARCHAR(50), purchased DATE)
 PARTITION BY RANGE(YEAR(purchased)) (
 PARTITION p0 VALUES LESS THAN (1990),
 PARTITION p1 VALUES LESS THAN (1995),
 PARTITION p2 VALUES LESS THAN (2000),
 PARTITION p3 VALUES LESS THAN (2005)
);
```

To repartition this table so that it is partitioned by key into two partitions using the `id` column value as the basis for the key, you can use this statement:

```
ALTER TABLE trb3 PARTITION BY KEY(id) PARTITIONS 2;
```

This has the same effect on the structure of the table as dropping the table and re-creating it using `CREATE TABLE trb3 PARTITION BY KEY(id) PARTITIONS 2;`.

`ALTER TABLE ... ENGINE [=] ...` changes only the storage engine used by the table, and leaves the table's partitioning scheme intact. The statement succeeds only if the target storage engine provides partitioning support. You can use `ALTER TABLE ... REMOVE PARTITIONING` to remove a table's partitioning; see [Section 15.1.9, “ALTER TABLE Statement”](#).

#### Important

Only a single `PARTITION BY`, `ADD PARTITION`, `DROP PARTITION`, `REORGANIZE PARTITION`, or `COALESCE PARTITION` clause can be used in a given `ALTER TABLE` statement. If you (for example) wish to drop a partition and reorganize a table's remaining partitions, you must do so in two separate `ALTER TABLE` statements (one using `DROP PARTITION` and then a second one using `REORGANIZE PARTITION`).

You can delete all rows from one or more selected partitions using `ALTER TABLE ... TRUNCATE PARTITION`.

### 26.3.1 Management of RANGE and LIST Partitions

Adding and dropping of range and list partitions are handled in a similar fashion, so we discuss the management of both sorts of partitioning in this section. For information about working with tables that are partitioned by hash or key, see [Section 26.3.2, “Management of HASH and KEY Partitions”](#).

Dropping a partition from a table that is partitioned by either `RANGE` or by `LIST` can be accomplished using the `ALTER TABLE` statement with the `DROP PARTITION` option. Suppose that you have created a table that is partitioned by range and then populated with 10 records using the following `CREATE TABLE` and `INSERT` statements:

```
mysql> CREATE TABLE tr (id INT, name VARCHAR(50), purchased DATE)
-> PARTITION BY RANGE(YEAR(purchased)) (
-> PARTITION p0 VALUES LESS THAN (1990),
-> PARTITION p1 VALUES LESS THAN (1995),
-> PARTITION p2 VALUES LESS THAN (2000),
-> PARTITION p3 VALUES LESS THAN (2005),
-> PARTITION p4 VALUES LESS THAN (2010),
-> PARTITION p5 VALUES LESS THAN (2015)
->);
Query OK, 0 rows affected (0.28 sec)

mysql> INSERT INTO tr VALUES
-> (1, 'desk organiser', '2003-10-15'),
-> (2, 'alarm clock', '1997-11-05'),
```

```

-> (3, 'chair', '2009-03-10'),
-> (4, 'bookcase', '1989-01-10'),
-> (5, 'exercise bike', '2014-05-09'),
-> (6, 'sofa', '1987-06-05'),
-> (7, 'espresso maker', '2011-11-22'),
-> (8, 'aquarium', '1992-08-04'),
-> (9, 'study desk', '2006-09-16'),
-> (10, 'lava lamp', '1998-12-25');
Query OK, 10 rows affected (0.05 sec)
Records: 10 Duplicates: 0 Warnings: 0

```

You can see which items should have been inserted into partition `p2` as shown here:

```

mysql> SELECT * FROM tr
-> WHERE purchased BETWEEN '1995-01-01' AND '1999-12-31';
+----+-----+-----+
| id | name | purchased |
+----+-----+-----+
| 2 | alarm clock | 1997-11-05 |
| 10 | lava lamp | 1998-12-25 |
+----+-----+-----+
2 rows in set (0.00 sec)

```

You can also get this information using partition selection, as shown here:

```

mysql> SELECT * FROM tr PARTITION (p2);
+----+-----+-----+
| id | name | purchased |
+----+-----+-----+
| 2 | alarm clock | 1997-11-05 |
| 10 | lava lamp | 1998-12-25 |
+----+-----+-----+
2 rows in set (0.00 sec)

```

See [Section 26.5, “Partition Selection”](#), for more information.

To drop the partition named `p2`, execute the following command:

```

mysql> ALTER TABLE tr DROP PARTITION p2;
Query OK, 0 rows affected (0.03 sec)

```

#### Note

The `NDBCLUSTER` storage engine does not support `ALTER TABLE ... DROP PARTITION`. It does, however, support the other partitioning-related extensions to `ALTER TABLE` that are described in this chapter.

It is very important to remember that, *when you drop a partition, you also delete all the data that was stored in that partition*. You can see that this is the case by re-running the previous `SELECT` query:

```

mysql> SELECT * FROM tr WHERE purchased
-> BETWEEN '1995-01-01' AND '1999-12-31';
Empty set (0.00 sec)

```

#### Note

`DROP PARTITION` is supported by native partitioning in-place APIs and may be used with `ALGORITHM={COPY|INPLACE}`. `DROP PARTITION` with `ALGORITHM=INPLACE` deletes data stored in the partition and drops the partition. However, `DROP PARTITION` with `ALGORITHM=COPY` or `old_alter_table=ON` rebuilds the partitioned table and attempts to move data from the dropped partition to another partition with a compatible `PARTITION ... VALUES` definition. Data that cannot be moved to another partition is deleted.

Because of this, you must have the `DROP` privilege for a table before you can execute `ALTER TABLE ... DROP PARTITION` on that table.

If you wish to drop all data from all partitions while preserving the table definition and its partitioning scheme, use the `TRUNCATE TABLE` statement. (See [Section 15.1.37, “TRUNCATE TABLE Statement”](#).)

If you intend to change the partitioning of a table *without* losing data, use `ALTER TABLE ... REORGANIZE PARTITION` instead. See below or in [Section 15.1.9, “ALTER TABLE Statement”](#), for information about `REORGANIZE PARTITION`.

If you now execute a `SHOW CREATE TABLE` statement, you can see how the partitioning makeup of the table has been changed:

```
mysql> SHOW CREATE TABLE tr\G
***** 1. row *****
Table: tr
Create Table: CREATE TABLE `tr` (
 `id` int(11) DEFAULT NULL,
 `name` varchar(50) DEFAULT NULL,
 `purchased` date DEFAULT NULL
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_0900_ai_ci
/*!50100 PARTITION BY RANGE (YEAR(purchased))
(PARTITION p0 VALUES LESS THAN (1990) ENGINE = InnoDB,
 PARTITION p1 VALUES LESS THAN (1995) ENGINE = InnoDB,
 PARTITION p3 VALUES LESS THAN (2005) ENGINE = InnoDB,
 PARTITION p4 VALUES LESS THAN (2010) ENGINE = InnoDB,
 PARTITION p5 VALUES LESS THAN (2015) ENGINE = InnoDB) */
1 row in set (0.00 sec)
```

When you insert new rows into the changed table with `purchased` column values between '`1995-01-01`' and '`2004-12-31`' inclusive, those rows are stored in partition `p3`. You can verify this as follows:

```
mysql> INSERT INTO tr VALUES (11, 'pencil holder', '1995-07-12');
Query OK, 1 row affected (0.00 sec)

mysql> SELECT * FROM tr WHERE purchased
 -> BETWEEN '1995-01-01' AND '2004-12-31';
+----+-----+-----+
| id | name | purchased |
+----+-----+-----+
| 1 | desk organiser | 2003-10-15 |
| 11 | pencil holder | 1995-07-12 |
+----+-----+-----+
2 rows in set (0.00 sec)

mysql> ALTER TABLE tr DROP PARTITION p3;
Query OK, 0 rows affected (0.03 sec)

mysql> SELECT * FROM tr WHERE purchased
 -> BETWEEN '1995-01-01' AND '2004-12-31';
Empty set (0.00 sec)
```

The number of rows dropped from the table as a result of `ALTER TABLE ... DROP PARTITION` is not reported by the server as it would be by the equivalent `DELETE` query.

Dropping `LIST` partitions uses exactly the same `ALTER TABLE ... DROP PARTITION` syntax as used for dropping `RANGE` partitions. However, there is one important difference in the effect this has on your use of the table afterward: You can no longer insert into the table any rows having any of the values that were included in the value list defining the deleted partition. (See [Section 26.2.2, “LIST Partitioning”](#), for an example.)

To add a new range or list partition to a previously partitioned table, use the `ALTER TABLE ... ADD PARTITION` statement. For tables which are partitioned by `RANGE`, this can be used to add a new range to the end of the list of existing partitions. Suppose that you have a partitioned table containing membership data for your organization, which is defined as follows:

```
CREATE TABLE members (
 id INT,
```

```

 fname VARCHAR(25),
 lname VARCHAR(25),
 dob DATE
)
PARTITION BY RANGE(YEAR(dob)) (
 PARTITION p0 VALUES LESS THAN (1980),
 PARTITION p1 VALUES LESS THAN (1990),
 PARTITION p2 VALUES LESS THAN (2000)
);

```

Suppose further that the minimum age for members is 16. As the calendar approaches the end of 2015, you realize that you must soon be prepared to admit members who were born in 2000 (and later). You can modify the `members` table to accommodate new members born in the years 2000 to 2010 as shown here:

```
ALTER TABLE members ADD PARTITION (PARTITION p3 VALUES LESS THAN (2010));
```

With tables that are partitioned by range, you can use `ADD PARTITION` to add new partitions to the high end of the partitions list only. Trying to add a new partition in this manner between or before existing partitions results in an error as shown here:

```

mysql> ALTER TABLE members
 > ADD PARTITION (
 > PARTITION n VALUES LESS THAN (1970));
ERROR 1463 (HY000): VALUES LESS THAN value must be strictly »
 increasing for each partition

```

You can work around this problem by reorganizing the first partition into two new ones that split the range between them, like this:

```

ALTER TABLE members
 REORGANIZE PARTITION p0 INTO (
 PARTITION n0 VALUES LESS THAN (1970),
 PARTITION n1 VALUES LESS THAN (1980)
);

```

Using `SHOW CREATE TABLE` you can see that the `ALTER TABLE` statement has had the desired effect:

```

mysql> SHOW CREATE TABLE members\G
***** 1. row *****
 Table: members
Create Table: CREATE TABLE `members` (
 `id` int(11) DEFAULT NULL,
 `fname` varchar(25) DEFAULT NULL,
 `lname` varchar(25) DEFAULT NULL,
 `dob` date DEFAULT NULL
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_0900_ai_ci
/*!50100 PARTITION BY RANGE (YEAR(dob))
(PARTITION n0 VALUES LESS THAN (1970) ENGINE = InnoDB,
 PARTITION n1 VALUES LESS THAN (1980) ENGINE = InnoDB,
 PARTITION p1 VALUES LESS THAN (1990) ENGINE = InnoDB,
 PARTITION p2 VALUES LESS THAN (2000) ENGINE = InnoDB,
 PARTITION p3 VALUES LESS THAN (2010) ENGINE = InnoDB) */
1 row in set (0.00 sec)

```

See also Section 15.1.9.1, “`ALTER TABLE Partition Operations`”.

You can also use `ALTER TABLE ... ADD PARTITION` to add new partitions to a table that is partitioned by `LIST`. Suppose a table `tt` is defined using the following `CREATE TABLE` statement:

```

CREATE TABLE tt (
 id INT,
 data INT
)
PARTITION BY LIST(data) (
 PARTITION p0 VALUES IN (5, 10, 15),
 PARTITION p1 VALUES IN (6, 12, 18)
);

```

You can add a new partition in which to store rows having the `data` column values `7`, `14`, and `21` as shown:

```
ALTER TABLE tt ADD PARTITION (PARTITION p2 VALUES IN (7, 14, 21));
```

Keep in mind that you *cannot* add a new `LIST` partition encompassing any values that are already included in the value list of an existing partition. If you attempt to do so, an error results:

```
mysql> ALTER TABLE tt ADD PARTITION
 > (PARTITION np VALUES IN (4, 8, 12));
ERROR 1465 (HY000): Multiple definition of same constant »
 in list partitioning
```

Because any rows with the `data` column value `12` have already been assigned to partition `p1`, you cannot create a new partition on table `tt` that includes `12` in its value list. To accomplish this, you could drop `p1`, and add `np` and then a new `p1` with a modified definition. However, as discussed earlier, this would result in the loss of all data stored in `p1`—and it is often the case that this is not what you really want to do. Another solution might appear to be to make a copy of the table with the new partitioning and to copy the data into it using `CREATE TABLE ... SELECT ...`, then drop the old table and rename the new one, but this could be very time-consuming when dealing with a large amounts of data. This also might not be feasible in situations where high availability is a requirement.

You can add multiple partitions in a single `ALTER TABLE ... ADD PARTITION` statement as shown here:

```
CREATE TABLE employees (
 id INT NOT NULL,
 fname VARCHAR(50) NOT NULL,
 lname VARCHAR(50) NOT NULL,
 hired DATE NOT NULL
)
PARTITION BY RANGE(YEAR(hired)) (
 PARTITION p1 VALUES LESS THAN (1991),
 PARTITION p2 VALUES LESS THAN (1996),
 PARTITION p3 VALUES LESS THAN (2001),
 PARTITION p4 VALUES LESS THAN (2005)
);

ALTER TABLE employees ADD PARTITION (
 PARTITION p5 VALUES LESS THAN (2010),
 PARTITION p6 VALUES LESS THAN MAXVALUE
);
```

Fortunately, MySQL's partitioning implementation provides ways to redefine partitions without losing data. Let us look first at a couple of simple examples involving `RANGE` partitioning. Recall the `members` table which is now defined as shown here:

```
mysql> SHOW CREATE TABLE members\G
***** 1. row *****
 Table: members
Create Table: CREATE TABLE `members` (
 `id` int(11) DEFAULT NULL,
 `fname` varchar(25) DEFAULT NULL,
 `lname` varchar(25) DEFAULT NULL,
 `dob` date DEFAULT NULL
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_0900_ai_ci
/*!50100 PARTITION BY RANGE (YEAR(dob))
(PARTITION n0 VALUES LESS THAN (1970) ENGINE = InnoDB,
 PARTITION n1 VALUES LESS THAN (1980) ENGINE = InnoDB,
 PARTITION p1 VALUES LESS THAN (1990) ENGINE = InnoDB,
 PARTITION p2 VALUES LESS THAN (2000) ENGINE = InnoDB,
 PARTITION p3 VALUES LESS THAN (2010) ENGINE = InnoDB) */
1 row in set (0.00 sec)
```

Suppose that you would like to move all rows representing members born before 1960 into a separate partition. As we have already seen, this cannot be done using `ALTER TABLE ... ADD PARTITION`. However, you can use another partition-related extension to `ALTER TABLE` to accomplish this:

```
ALTER TABLE members REORGANIZE PARTITION n0 INTO (
 PARTITION s0 VALUES LESS THAN (1960),
 PARTITION s1 VALUES LESS THAN (1970)
);
```

In effect, this command splits partition `n0` into two new partitions `s0` and `s1`. It also moves the data that was stored in `n0` into the new partitions according to the rules embodied in the two `PARTITION ... VALUES ...` clauses, so that `s0` contains only those records for which `YEAR(dob)` is less than 1960 and `s1` contains those rows in which `YEAR(dob)` is greater than or equal to 1960 but less than 1970.

A `REORGANIZE PARTITION` clause may also be used for merging adjacent partitions. You can reverse the effect of the previous statement on the `members` table as shown here:

```
ALTER TABLE members REORGANIZE PARTITION s0,s1 INTO (
 PARTITION p0 VALUES LESS THAN (1970)
);
```

No data is lost in splitting or merging partitions using `REORGANIZE PARTITION`. In executing the above statement, MySQL moves all of the records that were stored in partitions `s0` and `s1` into partition `p0`.

The general syntax for `REORGANIZE PARTITION` is shown here:

```
ALTER TABLE tbl_name
 REORGANIZE PARTITION partition_list
 INTO (partition_definitions);
```

Here, `tbl_name` is the name of the partitioned table, and `partition_list` is a comma-separated list of names of one or more existing partitions to be changed. `partition_definitions` is a comma-separated list of new partition definitions, which follow the same rules as for the `partition_definitions` list used in `CREATE TABLE`. You are not limited to merging several partitions into one, or to splitting one partition into many, when using `REORGANIZE PARTITION`. For example, you can reorganize all four partitions of the `members` table into two, like this:

```
ALTER TABLE members REORGANIZE PARTITION p0,p1,p2,p3 INTO (
 PARTITION m0 VALUES LESS THAN (1980),
 PARTITION m1 VALUES LESS THAN (2000)
);
```

You can also use `REORGANIZE PARTITION` with tables that are partitioned by `LIST`. Let us return to the problem of adding a new partition to the list-partitioned `tt` table and failing because the new partition had a value that was already present in the value-list of one of the existing partitions. We can handle this by adding a partition that contains only nonconflicting values, and then reorganizing the new partition and the existing one so that the value which was stored in the existing one is now moved to the new one:

```
ALTER TABLE tt ADD PARTITION (PARTITION np VALUES IN (4, 8));
ALTER TABLE tt REORGANIZE PARTITION p1,np INTO (
 PARTITION p1 VALUES IN (6, 18),
 PARTITION np VALUES IN (4, 8, 12)
);
```

Here are some key points to keep in mind when using `ALTER TABLE ... REORGANIZE PARTITION` to repartition tables that are partitioned by `RANGE` or `LIST`:

- The `PARTITION` options used to determine the new partitioning scheme are subject to the same rules as those used with a `CREATE TABLE` statement.

A new `RANGE` partitioning scheme cannot have any overlapping ranges; a new `LIST` partitioning scheme cannot have any overlapping sets of values.

- The combination of partitions in the `partition_definitions` list should account for the same range or set of values overall as the combined partitions named in the `partition_list`.

For example, partitions `p1` and `p2` together cover the years 1980 through 1999 in the `members` table used as an example in this section. Any reorganization of these two partitions should cover the same range of years overall.

- For tables partitioned by `RANGE`, you can reorganize only adjacent partitions; you cannot skip range partitions.

For instance, you could not reorganize the example `members` table using a statement beginning with `ALTER TABLE members REORGANIZE PARTITION p0,p2 INTO ...` because `p0` covers the years prior to 1970 and `p2` the years from 1990 through 1999 inclusive, so these are not adjacent partitions. (You cannot skip partition `p1` in this case.)

- You cannot use `REORGANIZE PARTITION` to change the type of partitioning used by the table (for example, you cannot change `RANGE` partitions to `HASH` partitions or the reverse). You also cannot use this statement to change the partitioning expression or column. To accomplish either of these tasks without dropping and re-creating the table, you can use `ALTER TABLE ... PARTITION BY ...`, as shown here:

```
ALTER TABLE members
 PARTITION BY HASH(YEAR(dob))
 PARTITIONS 8;
```

### 26.3.2 Management of HASH and KEY Partitions

Tables which are partitioned by hash or by key are very similar to one another with regard to making changes in a partitioning setup, and both differ in a number of ways from tables which have been partitioned by range or list. For that reason, this section addresses the modification of tables partitioned by hash or by key only. For a discussion of adding and dropping of partitions of tables that are partitioned by range or list, see [Section 26.3.1, “Management of RANGE and LIST Partitions”](#).

You cannot drop partitions from tables that are partitioned by `HASH` or `KEY` in the same way that you can from tables that are partitioned by `RANGE` or `LIST`. However, you can merge `HASH` or `KEY` partitions using `ALTER TABLE ... COALESCE PARTITION`. Suppose that a `clients` table containing data about clients is divided into 12 partitions, created as shown here:

```
CREATE TABLE clients (
 id INT,
 fname VARCHAR(30),
 lname VARCHAR(30),
 signed DATE
)
PARTITION BY HASH(MONTH(signed))
PARTITIONS 12;
```

To reduce the number of partitions from 12 to 8, execute the following `ALTER TABLE` statement:

```
mysql> ALTER TABLE clients COALESCE PARTITION 4;
Query OK, 0 rows affected (0.02 sec)
```

`COALESCE` works equally well with tables that are partitioned by `HASH`, `KEY`, `LINEAR HASH`, or `LINEAR KEY`. Here is an example similar to the previous one, differing only in that the table is partitioned by `LINEAR KEY`:

```
mysql> CREATE TABLE clients_lk (
 --> id INT,
 --> fname VARCHAR(30),
 --> lname VARCHAR(30),
 --> signed DATE
 -->)
 --> PARTITION BY LINEAR KEY(signed)
 --> PARTITIONS 12;
Query OK, 0 rows affected (0.03 sec)

mysql> ALTER TABLE clients_lk COALESCE PARTITION 4;
```

```
Query OK, 0 rows affected (0.06 sec)
Records: 0 Duplicates: 0 Warnings: 0
```

The number following `COALESCE PARTITION` is the number of partitions to merge into the remainder—in other words, it is the number of partitions to remove from the table.

Attempting to remove more partitions than are in the table results in an error like this one:

```
mysql> ALTER TABLE clients COALESCE PARTITION 18;
ERROR 1478 (HY000): Cannot remove all partitions, use DROP TABLE instead
```

To increase the number of partitions for the `clients` table from 12 to 18, use `ALTER TABLE ... ADD PARTITION` as shown here:

```
ALTER TABLE clients ADD PARTITION PARTITIONS 6;
```

### 26.3.3 Exchanging Partitions and Subpartitions with Tables

In MySQL 8.4, it is possible to exchange a table partition or subpartition with a table using `ALTER TABLE pt EXCHANGE PARTITION p WITH TABLE nt`, where `pt` is the partitioned table and `p` is the partition or subpartition of `pt` to be exchanged with unpartitioned table `nt`, provided that the following statements are true:

1. Table `nt` is not itself partitioned.
2. Table `nt` is not a temporary table.
3. The structures of tables `pt` and `nt` are otherwise identical.
4. Table `nt` contains no foreign key references, and no other table has any foreign keys that refer to `nt`.
5. There are no rows in `nt` that lie outside the boundaries of the partition definition for `p`. This condition does not apply if `WITHOUT VALIDATION` is used.
6. Both tables must use the same character set and collation.
7. For `InnoDB` tables, both tables must use the same row format. To determine the row format of an `InnoDB` table, query `INFORMATION_SCHEMA.INNODB_TABLES`.
8. Any partition-level `MAX_ROWS` setting for `p` must be the same as the table-level `MAX_ROWS` value set for `nt`. The setting for any partition-level `MIN_ROWS` setting for `p` must also be the same any table-level `MIN_ROWS` value set for `nt`.

This is true in either case whether or not `pt` has an explicit table-level `MAX_ROWS` or `MIN_ROWS` option in effect.

9. The `AVG_ROW_LENGTH` cannot differ between the two tables `pt` and `nt`.
10. `INDEX DIRECTORY` cannot differ between the table and the partition to be exchanged with it.
11. No table or partition `TABLESPACE` options can be used in either of the tables.

In addition to the `ALTER`, `INSERT`, and `CREATE` privileges usually required for `ALTER TABLE` statements, you must have the `DROP` privilege to perform `ALTER TABLE ... EXCHANGE PARTITION`.

You should also be aware of the following effects of `ALTER TABLE ... EXCHANGE PARTITION`:

- Executing `ALTER TABLE ... EXCHANGE PARTITION` does not invoke any triggers on either the partitioned table or the table to be exchanged.
- Any `AUTO_INCREMENT` columns in the exchanged table are reset.
- The `IGNORE` keyword has no effect when used with `ALTER TABLE ... EXCHANGE PARTITION`.

The syntax for `ALTER TABLE ... EXCHANGE PARTITION` is shown here, where `pt` is the partitioned table, `p` is the partition (or subpartition) to be exchanged, and `nt` is the nonpartitioned table to be exchanged with `p`:

```
ALTER TABLE pt
 EXCHANGE PARTITION p
 WITH TABLE nt;
```

Optionally, you can append `WITH VALIDATION` or `WITHOUT VALIDATION`. When `WITHOUT VALIDATION` is specified, the `ALTER TABLE ... EXCHANGE PARTITION` operation does not perform any row-by-row validation when exchanging a partition a nonpartitioned table, allowing database administrators to assume responsibility for ensuring that rows are within the boundaries of the partition definition. `WITH VALIDATION` is the default.

One and only one partition or subpartition may be exchanged with one and only one nonpartitioned table in a single `ALTER TABLE EXCHANGE PARTITION` statement. To exchange multiple partitions or subpartitions, use multiple `ALTER TABLE EXCHANGE PARTITION` statements. `EXCHANGE PARTITION` may not be combined with other `ALTER TABLE` options. The partitioning and (if applicable) subpartitioning used by the partitioned table may be of any type or types supported in MySQL 8.4.

## Exchanging a Partition with a Nonpartitioned Table

Suppose that a partitioned table `e` has been created and populated using the following SQL statements:

```
CREATE TABLE e (
 id INT NOT NULL,
 fname VARCHAR(30),
 lname VARCHAR(30)
)
PARTITION BY RANGE (id) (
 PARTITION p0 VALUES LESS THAN (50),
 PARTITION p1 VALUES LESS THAN (100),
 PARTITION p2 VALUES LESS THAN (150),
 PARTITION p3 VALUES LESS THAN (MAXVALUE)
);

INSERT INTO e VALUES
 (1669, "Jim", "Smith"),
 (337, "Mary", "Jones"),
 (16, "Frank", "White"),
 (2005, "Linda", "Black");
```

Now we create a nonpartitioned copy of `e` named `e2`. This can be done using the `mysql` client as shown here:

```
mysql> CREATE TABLE e2 LIKE e;
Query OK, 0 rows affected (0.04 sec)

mysql> ALTER TABLE e2 REMOVE PARTITIONING;
Query OK, 0 rows affected (0.07 sec)
Records: 0 Duplicates: 0 Warnings: 0
```

You can see which partitions in table `e` contain rows by querying the Information Schema `PARTITIONS` table, like this:

```
mysql> SELECT PARTITION_NAME, TABLE_ROWS
 FROM INFORMATION_SCHEMA.PARTITIONS
 WHERE TABLE_NAME = 'e';
+-----+-----+
| PARTITION_NAME | TABLE_ROWS |
+-----+-----+
| p0 | 1 |
| p1 | 0 |
| p2 | 0 |
| p3 | 3 |
```

```
+-----+-----+
2 rows in set (0.00 sec)
```

**Note**

For partitioned `InnoDB` tables, the row count given in the `TABLE_ROWS` column of the Information Schema `PARTITIONS` table is only an estimated value used in SQL optimization, and is not always exact.

To exchange partition `p0` in table `e` with table `e2`, you can use `ALTER TABLE`, as shown here:

```
mysql> ALTER TABLE e EXCHANGE PARTITION p0 WITH TABLE e2;
Query OK, 0 rows affected (0.04 sec)
```

More precisely, the statement just issued causes any rows found in the partition to be swapped with those found in the table. You can observe how this has happened by querying the Information Schema `PARTITIONS` table, as before. The table row that was previously found in partition `p0` is no longer present:

```
mysql> SELECT PARTITION_NAME, TABLE_ROWS
 FROM INFORMATION_SCHEMA.PARTITIONS
 WHERE TABLE_NAME = 'e';
+-----+-----+
| PARTITION_NAME | TABLE_ROWS |
+-----+-----+
| p0 | 0 |
| p1 | 0 |
| p2 | 0 |
| p3 | 3 |
+-----+-----+
4 rows in set (0.00 sec)
```

If you query table `e2`, you can see that the “missing” row can now be found there:

```
mysql> SELECT * FROM e2;
+---+---+
| id | fname | lname |
+---+---+
| 16 | Frank | White |
+---+---+
1 row in set (0.00 sec)
```

The table to be exchanged with the partition does not necessarily have to be empty. To demonstrate this, we first insert a new row into table `e`, making sure that this row is stored in partition `p0` by choosing an `id` column value that is less than 50, and verifying this afterward by querying the `PARTITIONS` table:

```
mysql> INSERT INTO e VALUES (41, "Michael", "Green");
Query OK, 1 row affected (0.05 sec)

mysql> SELECT PARTITION_NAME, TABLE_ROWS
 FROM INFORMATION_SCHEMA.PARTITIONS
 WHERE TABLE_NAME = 'e';
+-----+-----+
| PARTITION_NAME | TABLE_ROWS |
+-----+-----+
| p0 | 1 |
| p1 | 0 |
| p2 | 0 |
| p3 | 3 |
+-----+-----+
4 rows in set (0.00 sec)
```

Now we once again exchange partition `p0` with table `e2` using the same `ALTER TABLE` statement as previously:

```
mysql> ALTER TABLE e EXCHANGE PARTITION p0 WITH TABLE e2;
Query OK, 0 rows affected (0.28 sec)
```

The output of the following queries shows that the table row that was stored in partition `p0` and the table row that was stored in table `e2`, prior to issuing the `ALTER TABLE` statement, have now switched places:

```
mysql> SELECT * FROM e;
+----+-----+-----+
| id | fname | lname |
+----+-----+-----+
| 16 | Frank | White |
| 1669 | Jim | Smith |
| 337 | Mary | Jones |
| 2005 | Linda | Black |
+----+-----+-----+
4 rows in set (0.00 sec)

mysql> SELECT PARTITION_NAME, TABLE_ROWS
 FROM INFORMATION_SCHEMA.PARTITIONS
 WHERE TABLE_NAME = 'e';
+-----+-----+
| PARTITION_NAME | TABLE_ROWS |
+-----+-----+
| p0 | 1 |
| p1 | 0 |
| p2 | 0 |
| p3 | 3 |
+-----+-----+
4 rows in set (0.00 sec)

mysql> SELECT * FROM e2;
+----+-----+-----+
| id | fname | lname |
+----+-----+-----+
| 41 | Michael | Green |
+----+-----+-----+
1 row in set (0.00 sec)
```

## Nonmatching Rows

You should keep in mind that any rows found in the nonpartitioned table prior to issuing the `ALTER TABLE ... EXCHANGE PARTITION` statement must meet the conditions required for them to be stored in the target partition; otherwise, the statement fails. To see how this occurs, first insert a row into `e2` that is outside the boundaries of the partition definition for partition `p0` of table `e`. For example, insert a row with an `id` column value that is too large; then, try to exchange the table with the partition again:

```
mysql> INSERT INTO e2 VALUES (51, "Ellen", "McDonald");
Query OK, 1 row affected (0.08 sec)

mysql> ALTER TABLE e EXCHANGE PARTITION p0 WITH TABLE e2;
ERROR 1707 (HY000): Found row that does not match the partition
```

Only the `WITHOUT VALIDATION` option would permit this operation to succeed:

```
mysql> ALTER TABLE e EXCHANGE PARTITION p0 WITH TABLE e2 WITHOUT VALIDATION;
Query OK, 0 rows affected (0.02 sec)
```

When a partition is exchanged with a table that contains rows that do not match the partition definition, it is the responsibility of the database administrator to fix the non-matching rows, which can be performed using `REPAIR TABLE` or `ALTER TABLE ... REPAIR PARTITION`.

## Exchanging Partitions Without Row-By-Row Validation

To avoid time consuming validation when exchanging a partition with a table that has many rows, it is possible to skip the row-by-row validation step by appending `WITHOUT VALIDATION` to the `ALTER TABLE ... EXCHANGE PARTITION` statement.

The following example compares the difference between execution times when exchanging a partition with a nonpartitioned table, with and without validation. The partitioned table (table `e`) contains two

partitions of 1 million rows each. The rows in p0 of table e are removed and p0 is exchanged with a nonpartitioned table of 1 million rows. The `WITH VALIDATION` operation takes 0.74 seconds. By comparison, the `WITHOUT VALIDATION` operation takes 0.01 seconds.

```
Create a partitioned table with 1 million rows in each partition

CREATE TABLE e (
 id INT NOT NULL,
 fname VARCHAR(30),
 lname VARCHAR(30)
)
PARTITION BY RANGE (id) (
 PARTITION p0 VALUES LESS THAN (1000001),
 PARTITION p1 VALUES LESS THAN (2000001),
);
;

mysql> SELECT COUNT(*) FROM e;
| COUNT(*) |
+-----+
| 2000000 |
+-----+
1 row in set (0.27 sec)

View the rows in each partition

SELECT PARTITION_NAME, TABLE_ROWS FROM INFORMATION_SCHEMA.PARTITIONS WHERE TABLE_NAME = 'e';
+-----+-----+
| PARTITION_NAME | TABLE_ROWS |
+-----+-----+
| p0 | 1000000 |
| p1 | 1000000 |
+-----+-----+
2 rows in set (0.00 sec)

Create a nonpartitioned table of the same structure and populate it with 1 million rows

CREATE TABLE e2 (
 id INT NOT NULL,
 fname VARCHAR(30),
 lname VARCHAR(30)
);
;

mysql> SELECT COUNT(*) FROM e2;
+-----+
| COUNT(*) |
+-----+
| 1000000 |
+-----+
1 row in set (0.24 sec)

Create another nonpartitioned table of the same structure and populate it with 1 million rows

CREATE TABLE e3 (
 id INT NOT NULL,
 fname VARCHAR(30),
 lname VARCHAR(30)
);
;

mysql> SELECT COUNT(*) FROM e3;
+-----+
| COUNT(*) |
+-----+
| 1000000 |
+-----+
1 row in set (0.25 sec)

Drop the rows from p0 of table e

mysql> DELETE FROM e WHERE id < 1000001;
Query OK, 1000000 rows affected (5.55 sec)

Confirm that there are no rows in partition p0
```

```

mysql> SELECT PARTITION_NAME, TABLE_ROWS FROM INFORMATION_SCHEMA.PARTITIONS WHERE TABLE_NAME = 'e';
+-----+-----+
| PARTITION_NAME | TABLE_ROWS |
+-----+-----+
| p0 | 0 |
| p1 | 1000000 |
+-----+-----+
2 rows in set (0.00 sec)

Exchange partition p0 of table e with the table e2 'WITH VALIDATION'

mysql> ALTER TABLE e EXCHANGE PARTITION p0 WITH TABLE e2 WITH VALIDATION;
Query OK, 0 rows affected (0.74 sec)

Confirm that the partition was exchanged with table e2

mysql> SELECT PARTITION_NAME, TABLE_ROWS FROM INFORMATION_SCHEMA.PARTITIONS WHERE TABLE_NAME = 'e';
+-----+-----+
| PARTITION_NAME | TABLE_ROWS |
+-----+-----+
| p0 | 1000000 |
| p1 | 1000000 |
+-----+-----+
2 rows in set (0.00 sec)

Once again, drop the rows from p0 of table e

mysql> DELETE FROM e WHERE id < 1000000;
Query OK, 1000000 rows affected (5.55 sec)

Confirm that there are no rows in partition p0

mysql> SELECT PARTITION_NAME, TABLE_ROWS FROM INFORMATION_SCHEMA.PARTITIONS WHERE TABLE_NAME = 'e';
+-----+-----+
| PARTITION_NAME | TABLE_ROWS |
+-----+-----+
| p0 | 0 |
| p1 | 1000000 |
+-----+-----+
2 rows in set (0.00 sec)

Exchange partition p0 of table e with the table e3 'WITHOUT VALIDATION'

mysql> ALTER TABLE e EXCHANGE PARTITION p0 WITH TABLE e3 WITHOUT VALIDATION;
Query OK, 0 rows affected (0.01 sec)

Confirm that the partition was exchanged with table e3

mysql> SELECT PARTITION_NAME, TABLE_ROWS FROM INFORMATION_SCHEMA.PARTITIONS WHERE TABLE_NAME = 'e';
+-----+-----+
| PARTITION_NAME | TABLE_ROWS |
+-----+-----+
| p0 | 1000000 |
| p1 | 1000000 |
+-----+-----+
2 rows in set (0.00 sec)

```

If a partition is exchanged with a table that contains rows that do not match the partition definition, it is the responsibility of the database administrator to fix the non-matching rows, which can be performed using `REPAIR TABLE` or `ALTER TABLE ... REPAIR PARTITION`.

## Exchanging a Subpartition with a Nonpartitioned Table

You can also exchange a subpartition of a subpartitioned table (see [Section 26.2.6, “Subpartitioning”](#)) with a nonpartitioned table using an `ALTER TABLE ... EXCHANGE PARTITION` statement. In the following example, we first create a table `es` that is partitioned by `RANGE` and subpartitioned by `KEY`, populate this table as we did table `e`, and then create an empty, nonpartitioned copy `es2` of the table, as shown here:

```

mysql> CREATE TABLE es (
 -> id INT NOT NULL,
 -> fname VARCHAR(30),
 -> lname VARCHAR(30)
 ->)
 -> PARTITION BY RANGE (id)
 -> SUBPARTITION BY KEY (lname)
 -> SUBPARTITIONS 2 (
 -> PARTITION p0 VALUES LESS THAN (50),
 -> PARTITION p1 VALUES LESS THAN (100),
 -> PARTITION p2 VALUES LESS THAN (150),
 -> PARTITION p3 VALUES LESS THAN (MAXVALUE)
 ->);
Query OK, 0 rows affected (2.76 sec)

mysql> INSERT INTO es VALUES
 -> (1669, "Jim", "Smith"),
 -> (337, "Mary", "Jones"),
 -> (16, "Frank", "White"),
 -> (2005, "Linda", "Black");
Query OK, 4 rows affected (0.04 sec)
Records: 4 Duplicates: 0 Warnings: 0

mysql> CREATE TABLE es2 LIKE es;
Query OK, 0 rows affected (1.27 sec)

mysql> ALTER TABLE es2 REMOVE PARTITIONING;
Query OK, 0 rows affected (0.70 sec)
Records: 0 Duplicates: 0 Warnings: 0

```

Although we did not explicitly name any of the subpartitions when creating table `es`, we can obtain generated names for these by including the `SUBPARTITION_NAME` column of the `PARTITIONS` table from `INFORMATION_SCHEMA` when selecting from that table, as shown here:

```

mysql> SELECT PARTITION_NAME, SUBPARTITION_NAME, TABLE_ROWS
 -> FROM INFORMATION_SCHEMA.PARTITIONS
 -> WHERE TABLE_NAME = 'es';
+-----+-----+-----+
| PARTITION_NAME | SUBPARTITION_NAME | TABLE_ROWS |
+-----+-----+-----+
| p0 | p0sp0 | 1 |
| p0 | p0sp1 | 0 |
| p1 | p1sp0 | 0 |
| p1 | p1sp1 | 0 |
| p2 | p2sp0 | 0 |
| p2 | p2sp1 | 0 |
| p3 | p3sp0 | 3 |
| p3 | p3sp1 | 0 |
+-----+-----+-----+
8 rows in set (0.00 sec)

```

The following `ALTER TABLE` statement exchanges subpartition `p3sp0` in table `es` with the nonpartitioned table `es2`:

```

mysql> ALTER TABLE es EXCHANGE PARTITION p3sp0 WITH TABLE es2;
Query OK, 0 rows affected (0.29 sec)

```

You can verify that the rows were exchanged by issuing the following queries:

```

mysql> SELECT PARTITION_NAME, SUBPARTITION_NAME, TABLE_ROWS
 -> FROM INFORMATION_SCHEMA.PARTITIONS
 -> WHERE TABLE_NAME = 'es';
+-----+-----+-----+
| PARTITION_NAME | SUBPARTITION_NAME | TABLE_ROWS |
+-----+-----+-----+
| p0 | p0sp0 | 1 |
| p0 | p0sp1 | 0 |
| p1 | p1sp0 | 0 |
| p1 | p1sp1 | 0 |
| p2 | p2sp0 | 0 |
| p2 | p2sp1 | 0 |
+-----+-----+-----+

```

```

| p3 | p3sp0 | 0 |
| p3 | p3sp1 | 0 |
+-----+-----+-----+
8 rows in set (0.00 sec)

mysql> SELECT * FROM es2;
+----+----+----+
| id | fname | lname |
+----+----+----+
| 1669 | Jim | Smith |
| 337 | Mary | Jones |
| 2005 | Linda | Black |
+----+----+----+
3 rows in set (0.00 sec)

```

If a table is subpartitioned, you can exchange only a subpartition of the table—not an entire partition—with an unpartitioned table, as shown here:

```

mysql> ALTER TABLE es EXCHANGE PARTITION p3 WITH TABLE es2;
ERROR 1704 (HY000): Subpartitioned table, use subpartition instead of partition

```

Table structures are compared in a strict fashion; the number, order, names, and types of columns and indexes of the partitioned table and the nonpartitioned table must match exactly. In addition, both tables must use the same storage engine:

```

mysql> CREATE TABLE es3 LIKE e;
Query OK, 0 rows affected (1.31 sec)

mysql> ALTER TABLE es3 REMOVE PARTITIONING;
Query OK, 0 rows affected (0.53 sec)
Records: 0 Duplicates: 0 Warnings: 0

mysql> SHOW CREATE TABLE es3\G
***** 1. row *****
 Table: es3
Create Table: CREATE TABLE `es3` (
 `id` int(11) NOT NULL,
 `fname` varchar(30) DEFAULT NULL,
 `lname` varchar(30) DEFAULT NULL
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_0900_ai_ci
1 row in set (0.00 sec)

mysql> ALTER TABLE es3 ENGINE = MyISAM;
Query OK, 0 rows affected (0.15 sec)
Records: 0 Duplicates: 0 Warnings: 0

mysql> ALTER TABLE es EXCHANGE PARTITION p3sp0 WITH TABLE es3;
ERROR 1497 (HY000): The mix of handlers in the partitions is not allowed in this version of MySQL

```

The `ALTER TABLE ... ENGINE ...` statement in this example works because the previous `ALTER TABLE` removed the partitioning from table `es3`.

### 26.3.4 Maintenance of Partitions

A number of table and partition maintenance tasks can be carried out on partitioned tables using SQL statements intended for such purposes.

Table maintenance of partitioned tables can be accomplished using the statements `CHECK TABLE`, `OPTIMIZE TABLE`, `ANALYZE TABLE`, and `REPAIR TABLE`, which are supported for partitioned tables.

You can use a number of extensions to `ALTER TABLE` for performing operations of this type on one or more partitions directly, as described in the following list:

- **Rebuilding partitions.** Rebuilds the partition; this has the same effect as dropping all records stored in the partition, then reinserting them. This can be useful for purposes of defragmentation.

Example:

```
ALTER TABLE t1 REBUILD PARTITION p0, p1;
```

- **Optimizing partitions.** If you have deleted a large number of rows from a partition or if you have made many changes to a partitioned table with variable-length rows (that is, having `VARCHAR`, `BLOB`, or `TEXT` columns), you can use `ALTER TABLE ... OPTIMIZE PARTITION` to reclaim any unused space and to defragment the partition data file.

Example:

```
ALTER TABLE t1 OPTIMIZE PARTITION p0, p1;
```

Using `OPTIMIZE PARTITION` on a given partition is equivalent to running `CHECK PARTITION`, `ANALYZE PARTITION`, and `REPAIR PARTITION` on that partition.

Some MySQL storage engines, including `InnoDB`, do not support per-partition optimization; in these cases, `ALTER TABLE ... OPTIMIZE PARTITION` analyzes and rebuilds the entire table, and causes an appropriate warning to be issued. (Bug #11751825, Bug #42822) Use `ALTER TABLE ... REBUILD PARTITION` and `ALTER TABLE ... ANALYZE PARTITION` instead, to avoid this issue.

- **Analyzing partitions.** This reads and stores the key distributions for partitions.

Example:

```
ALTER TABLE t1 ANALYZE PARTITION p3;
```

- **Repairing partitions.** This repairs corrupted partitions.

Example:

```
ALTER TABLE t1 REPAIR PARTITION p0,p1;
```

Normally, `REPAIR PARTITION` fails when the partition contains duplicate key errors. You can use `ALTER IGNORE TABLE` with this option, in which case all rows that cannot be moved due to the presence of duplicate keys are removed from the partition (Bug #16900947).

- **Checking partitions.** You can check partitions for errors in much the same way that you can use `CHECK TABLE` with nonpartitioned tables.

Example:

```
ALTER TABLE trb3 CHECK PARTITION p1;
```

This statement tells you whether the data or indexes in partition `p1` of table `t1` are corrupted. If this is the case, use `ALTER TABLE ... REPAIR PARTITION` to repair the partition.

Normally, `CHECK PARTITION` fails when the partition contains duplicate key errors. You can use `ALTER IGNORE TABLE` with this option, in which case the statement returns the contents of each row in the partition where a duplicate key violation is found. Only the values for the columns in the partitioning expression for the table are reported. (Bug #16900947)

Each of the statements in the list just shown also supports the keyword `ALL` in place of the list of partition names. Using `ALL` causes the statement to act on all partitions in the table.

You can also truncate partitions using `ALTER TABLE ... TRUNCATE PARTITION`. This statement can be used to delete all rows from one or more partitions in much the same way that `TRUNCATE TABLE` deletes all rows from a table.

`ALTER TABLE ... TRUNCATE PARTITION ALL` truncates all partitions in the table.

## 26.3.5 Obtaining Information About Partitions

This section discusses obtaining information about existing partitions, which can be done in a number of ways. Methods of obtaining such information include the following:

- Using the `SHOW CREATE TABLE` statement to view the partitioning clauses used in creating a partitioned table.
- Using the `SHOW TABLE STATUS` statement to determine whether a table is partitioned.
- Querying the Information Schema `PARTITIONS` table.
- Using the statement `EXPLAIN SELECT` to see which partitions are used by a given `SELECT`.

When insertions, deletions, or updates are made to partitioned tables, the binary log records information about the partition and (if any) the subpartition in which the row event took place. A new row event is created for a modification that takes place in a different partition or subpartition, even if the table involved is the same. So if a transaction involves three partitions or subpartitions, three row events are generated. For an update event, the partition information is recorded for both the “before” image and the “after” image. The partition information is displayed if you specify the `-v` or `--verbose` option when viewing the binary log using `mysqlbinlog`. Partition information is only recorded when row-based logging is in use (`binlog_format=ROW`).

As discussed elsewhere in this chapter, `SHOW CREATE TABLE` includes in its output the `PARTITION BY` clause used to create a partitioned table. For example:

```
mysql> SHOW CREATE TABLE trb3\G
***** 1. row *****
 Table: trb3
Create Table: CREATE TABLE `trb3` (
 `id` int(11) DEFAULT NULL,
 `name` varchar(50) DEFAULT NULL,
 `purchased` date DEFAULT NULL
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_0900_ai_ci
/*!50100 PARTITION BY RANGE (YEAR(purchased))
(PARTITION p0 VALUES LESS THAN (1990) ENGINE = InnoDB,
 PARTITION p1 VALUES LESS THAN (1995) ENGINE = InnoDB,
 PARTITION p2 VALUES LESS THAN (2000) ENGINE = InnoDB,
 PARTITION p3 VALUES LESS THAN (2005) ENGINE = InnoDB) */
0 row in set (0.00 sec)
```

The output from `SHOW TABLE STATUS` for partitioned tables is the same as that for nonpartitioned tables, except that the `Create_options` column contains the string `partitioned`. The `Engine` column contains the name of the storage engine used by all partitions of the table. (See [Section 15.7.7.38, “SHOW TABLE STATUS Statement”](#), for more information about this statement.)

You can also obtain information about partitions from `INFORMATION_SCHEMA`, which contains a `PARTITIONS` table. See [Section 28.3.21, “The INFORMATION\\_SCHEMA PARTITIONS Table”](#).

It is possible to determine which partitions of a partitioned table are involved in a given `SELECT` query using `EXPLAIN`. The `partitions` column in the `EXPLAIN` output lists the partitions from which records would be matched by the query.

Suppose that a table `trb1` is created and populated as follows:

```
CREATE TABLE trb1 (id INT, name VARCHAR(50), purchased DATE)
 PARTITION BY RANGE(id)
 (
 PARTITION p0 VALUES LESS THAN (3),
 PARTITION p1 VALUES LESS THAN (7),
 PARTITION p2 VALUES LESS THAN (9),
 PARTITION p3 VALUES LESS THAN (11)
);
INSERT INTO trb1 VALUES
 (1, 'desk organiser', '2003-10-15'),
```

```
(2, 'CD player', '1993-11-05'),
(3, 'TV set', '1996-03-10'),
(4, 'bookcase', '1982-01-10'),
(5, 'exercise bike', '2004-05-09'),
(6, 'sofa', '1987-06-05'),
(7, 'popcorn maker', '2001-11-22'),
(8, 'aquarium', '1992-08-04'),
(9, 'study desk', '1984-09-16'),
(10, 'lava lamp', '1998-12-25');
```

You can see which partitions are used in a query such as `SELECT * FROM trbl;`, as shown here:

```
mysql> EXPLAIN SELECT * FROM trbl\G
***** 1. row *****
 id: 1
 select_type: SIMPLE
 table: trbl
 partitions: p0,p1,p2,p3
 type: ALL
possible_keys: NULL
 key: NULL
 key_len: NULL
 ref: NULL
 rows: 10
 Extra: Using filesort
```

In this case, all four partitions are searched. However, when a limiting condition making use of the partitioning key is added to the query, you can see that only those partitions containing matching values are scanned, as shown here:

```
mysql> EXPLAIN SELECT * FROM trbl WHERE id < 5\G
***** 1. row *****
 id: 1
 select_type: SIMPLE
 table: trbl
 partitions: p0,p1
 type: ALL
possible_keys: NULL
 key: NULL
 key_len: NULL
 ref: NULL
 rows: 10
 Extra: Using where
```

`EXPLAIN` also provides information about keys used and possible keys:

```
mysql> ALTER TABLE trbl ADD PRIMARY KEY (id);
Query OK, 10 rows affected (0.03 sec)
Records: 10 Duplicates: 0 Warnings: 0

mysql> EXPLAIN SELECT * FROM trbl WHERE id < 5\G
***** 1. row *****
 id: 1
 select_type: SIMPLE
 table: trbl
 partitions: p0,p1
 type: range
possible_keys: PRIMARY
 key: PRIMARY
 key_len: 4
 ref: NULL
 rows: 7
 Extra: Using where
```

If `EXPLAIN` is used to examine a query against a nonpartitioned table, no error is produced, but the value of the `partitions` column is always `NULL`.

The `rows` column of `EXPLAIN` output displays the total number of rows in the table.

See also Section 15.8.2, “`EXPLAIN Statement`”.

## 26.4 Partition Pruning

The optimization known as *partition pruning* is based on a relatively simple concept which can be described as “Do not scan partitions where there can be no matching values”. Suppose a partitioned table `t1` is created by this statement:

```
CREATE TABLE t1 (
 fname VARCHAR(50) NOT NULL,
 lname VARCHAR(50) NOT NULL,
 region_code TINYINT UNSIGNED NOT NULL,
 dob DATE NOT NULL
)
PARTITION BY RANGE(region_code) (
 PARTITION p0 VALUES LESS THAN (64),
 PARTITION p1 VALUES LESS THAN (128),
 PARTITION p2 VALUES LESS THAN (192),
 PARTITION p3 VALUES LESS THAN MAXVALUE
);
```

Suppose that you wish to obtain results from a `SELECT` statement such as this one:

```
SELECT fname, lname, region_code, dob
 FROM t1
 WHERE region_code > 125 AND region_code < 130;
```

It is easy to see that none of the rows which ought to be returned are in either of the partitions `p0` or `p3`; that is, we need search only in partitions `p1` and `p2` to find matching rows. By limiting the search, it is possible to expend much less time and effort in finding matching rows than by scanning all partitions in the table. This “cutting away” of unneeded partitions is known as *pruning*. When the optimizer can make use of partition pruning in performing this query, execution of the query can be an order of magnitude faster than the same query against a nonpartitioned table containing the same column definitions and data.

The optimizer can perform pruning whenever a `WHERE` condition can be reduced to either one of the following two cases:

- `partition_column = constant`
- `partition_column IN (constant1, constant2, ..., constantN)`

In the first case, the optimizer simply evaluates the partitioning expression for the value given, determines which partition contains that value, and scans only this partition. In many cases, the equal sign can be replaced with another arithmetic comparison, including `<`, `>`, `<=`, `>=`, and `<>`. Some queries using `BETWEEN` in the `WHERE` clause can also take advantage of partition pruning. See the examples later in this section.

In the second case, the optimizer evaluates the partitioning expression for each value in the list, creates a list of matching partitions, and then scans only the partitions in this partition list.

`SELECT`, `DELETE`, and `UPDATE` statements support partition pruning. An `INSERT` statement also accesses only one partition per inserted row; this is true even for a table that is partitioned by `HASH` or `KEY` although this is not currently shown in the output of `EXPLAIN`.

Pruning can also be applied to short ranges, which the optimizer can convert into equivalent lists of values. For instance, in the previous example, the `WHERE` clause can be converted to `WHERE region_code IN (126, 127, 128, 129)`. Then the optimizer can determine that the first two values in the list are found in partition `p1`, the remaining two values in partition `p2`, and that the other partitions contain no relevant values and so do not need to be searched for matching rows.

The optimizer can also perform pruning for `WHERE` conditions that involve comparisons of the preceding types on multiple columns for tables that use `RANGE COLUMNS` or `LIST COLUMNS` partitioning.

This type of optimization can be applied whenever the partitioning expression consists of an equality or a range which can be reduced to a set of equalities, or when the partitioning expression represents an

increasing or decreasing relationship. Pruning can also be applied for tables partitioned on a `DATE` or `DATETIME` column when the partitioning expression uses the `YEAR()` or `TO_DAYS()` function. Pruning can also be applied for such tables when the partitioning expression uses the `TO_SECONDS()` function.

Suppose that table `t2`, partitioned on a `DATE` column, is created using the statement shown here:

```
CREATE TABLE t2 (
 fname VARCHAR(50) NOT NULL,
 lname VARCHAR(50) NOT NULL,
 region_code TINYINT UNSIGNED NOT NULL,
 dob DATE NOT NULL
)
PARTITION BY RANGE(YEAR(dob)) (
 PARTITION d0 VALUES LESS THAN (1970),
 PARTITION d1 VALUES LESS THAN (1975),
 PARTITION d2 VALUES LESS THAN (1980),
 PARTITION d3 VALUES LESS THAN (1985),
 PARTITION d4 VALUES LESS THAN (1990),
 PARTITION d5 VALUES LESS THAN (2000),
 PARTITION d6 VALUES LESS THAN (2005),
 PARTITION d7 VALUES LESS THAN MAXVALUE
);
```

The following statements using `t2` can make use of partition pruning:

```
SELECT * FROM t2 WHERE dob = '1982-06-23';

UPDATE t2 SET region_code = 8 WHERE dob BETWEEN '1991-02-15' AND '1997-04-25';

DELETE FROM t2 WHERE dob >= '1984-06-21' AND dob <= '1999-06-21'
```

In the case of the last statement, the optimizer can also act as follows:

1. *Find the partition containing the low end of the range.*

`YEAR('1984-06-21')` yields the value `1984`, which is found in partition `d3`.

2. *Find the partition containing the high end of the range.*

`YEAR('1999-06-21')` evaluates to `1999`, which is found in partition `d5`.

3. *Scan only these two partitions and any partitions that may lie between them.*

In this case, this means that only partitions `d3`, `d4`, and `d5` are scanned. The remaining partitions may be safely ignored (and are ignored).

### Important

Invalid `DATE` and `DATETIME` values referenced in the `WHERE` condition of a statement against a partitioned table are treated as `NULL`. This means that a query such as `SELECT * FROM partitioned_table WHERE date_column < '2008-12-00'` does not return any values (see Bug #40972).

So far, we have looked only at examples using `RANGE` partitioning, but pruning can be applied with other partitioning types as well.

Consider a table that is partitioned by `LIST`, where the partitioning expression is increasing or decreasing, such as the table `t3` shown here. (In this example, we assume for the sake of brevity that the `region_code` column is limited to values between 1 and 10 inclusive.)

```
CREATE TABLE t3 (
 fname VARCHAR(50) NOT NULL,
 lname VARCHAR(50) NOT NULL,
 region_code TINYINT UNSIGNED NOT NULL,
 dob DATE NOT NULL
)
```

```
PARTITION BY LIST(region_code) (
 PARTITION r0 VALUES IN (1, 3),
 PARTITION r1 VALUES IN (2, 5, 8),
 PARTITION r2 VALUES IN (4, 9),
 PARTITION r3 VALUES IN (6, 7, 10)
);
```

For a statement such as `SELECT * FROM t3 WHERE region_code BETWEEN 1 AND 3`, the optimizer determines in which partitions the values 1, 2, and 3 are found (`r0` and `r1`) and skips the remaining ones (`r2` and `r3`).

For tables that are partitioned by `HASH` or `[LINEAR] KEY`, partition pruning is also possible in cases in which the `WHERE` clause uses a simple `=` relation against a column used in the partitioning expression. Consider a table created like this:

```
CREATE TABLE t4 (
 fname VARCHAR(50) NOT NULL,
 lname VARCHAR(50) NOT NULL,
 region_code TINYINT UNSIGNED NOT NULL,
 dob DATE NOT NULL
)
PARTITION BY KEY(region_code)
PARTITIONS 8;
```

A statement that compares a column value with a constant can be pruned:

```
UPDATE t4 WHERE region_code = 7;
```

Pruning can also be employed for short ranges, because the optimizer can turn such conditions into `IN` relations. For example, using the same table `t4` as defined previously, queries such as these can be pruned:

```
SELECT * FROM t4 WHERE region_code > 2 AND region_code < 6;
SELECT * FROM t4 WHERE region_code BETWEEN 3 AND 5;
```

In both these cases, the `WHERE` clause is transformed by the optimizer into `WHERE region_code IN (3, 4, 5)`.

### Important

This optimization is used only if the range size is smaller than the number of partitions. Consider this statement:

```
DELETE FROM t4 WHERE region_code BETWEEN 4 AND 12;
```

The range in the `WHERE` clause covers 9 values (4, 5, 6, 7, 8, 9, 10, 11, 12), but `t4` has only 8 partitions. This means that the `DELETE` cannot be pruned.

When a table is partitioned by `HASH` or `[LINEAR] KEY`, pruning can be used only on integer columns. For example, this statement cannot use pruning because `dob` is a `DATE` column:

```
SELECT * FROM t4 WHERE dob >= '2001-04-14' AND dob <= '2005-10-15';
```

However, if the table stores year values in an `INT` column, then a query having `WHERE year_col >= 2001 AND year_col <= 2005` can be pruned.

Tables using a storage engine that provides automatic partitioning, such as the `NDB` storage engine used by MySQL Cluster can be pruned if they are explicitly partitioned.

## 26.5 Partition Selection

Explicit selection of partitions and subpartitions for rows matching a given `WHERE` condition is supported. Partition selection is similar to partition pruning, in that only specific partitions are checked for matches, but differs in two key respects:

1. The partitions to be checked are specified by the issuer of the statement, unlike partition pruning, which is automatic.
2. Whereas partition pruning applies only to queries, explicit selection of partitions is supported for both queries and a number of DML statements.

SQL statements supporting explicit partition selection are listed here:

- [SELECT](#)
- [DELETE](#)
- [INSERT](#)
- [REPLACE](#)
- [UPDATE](#)
- [LOAD DATA](#).
- [LOAD XML](#).

The remainder of this section discusses explicit partition selection as it applies generally to the statements just listed, and provides some examples.

Explicit partition selection is implemented using a [PARTITION](#) option. For all supported statements, this option uses the syntax shown here:

```
PARTITION (partition_names)
partition_names:
 partition_name, ...
```

This option always follows the name of the table to which the partition or partitions belong. *partition\_names* is a comma-separated list of partitions or subpartitions to be used. Each name in this list must be the name of an existing partition or subpartition of the specified table; if any of the partitions or subpartitions are not found, the statement fails with an error ([partition 'partition\\_name' doesn't exist](#)). Partitions and subpartitions named in *partition\_names* may be listed in any order, and may overlap.

When the [PARTITION](#) option is used, only the partitions and subpartitions listed are checked for matching rows. This option can be used in a [SELECT](#) statement to determine which rows belong to a given partition. Consider a partitioned table named [employees](#), created and populated using the statements shown here:

```
SET @@SQL_MODE = '';

CREATE TABLE employees (
 id INT NOT NULL AUTO_INCREMENT PRIMARY KEY,
 fname VARCHAR(25) NOT NULL,
 lname VARCHAR(25) NOT NULL,
 store_id INT NOT NULL,
 department_id INT NOT NULL
)
PARTITION BY RANGE(id) (
 PARTITION p0 VALUES LESS THAN (5),
 PARTITION p1 VALUES LESS THAN (10),
 PARTITION p2 VALUES LESS THAN (15),
 PARTITION p3 VALUES LESS THAN MAXVALUE
);

INSERT INTO employees VALUES
 ('', 'Bob', 'Taylor', 3, 2), ('', 'Frank', 'Williams', 1, 2),
 ('', 'Ellen', 'Johnson', 3, 4), ('', 'Jim', 'Smith', 2, 4),
 ('', 'Mary', 'Jones', 1, 1), ('', 'Linda', 'Black', 2, 3),
 ('', 'Ed', 'Jones', 2, 1), ('', 'June', 'Wilson', 3, 1),
 ('', 'Andy', 'Smith', 1, 3), ('', 'Lou', 'Waters', 2, 4),
 ('', 'Jill', 'Stone', 1, 4), ('', 'Roger', 'White', 3, 2),
```

```
('', 'Howard', 'Andrews', 1, 2), ('', 'Fred', 'Goldberg', 3, 3),
('', 'Barbara', 'Brown', 2, 3), ('', 'Alice', 'Rogers', 2, 2),
('', 'Mark', 'Morgan', 3, 3), ('', 'Karen', 'Cole', 3, 2);
```

You can see which rows are stored in partition `p1` like this:

```
mysql> SELECT * FROM employees PARTITION (p1);
+----+-----+-----+-----+
| id | fname | lname | store_id | department_id |
+----+-----+-----+-----+
| 5 | Mary | Jones | 1 | 1 |
| 6 | Linda | Black | 2 | 3 |
| 7 | Ed | Jones | 2 | 1 |
| 8 | June | Wilson | 3 | 1 |
| 9 | Andy | Smith | 1 | 3 |
+----+-----+-----+-----+
5 rows in set (0.00 sec)
```

The result is the same as obtained by the query `SELECT * FROM employees WHERE id BETWEEN 5 AND 9.`

To obtain rows from multiple partitions, supply their names as a comma-delimited list. For example, `SELECT * FROM employees PARTITION (p1, p2)` returns all rows from partitions `p1` and `p2` while excluding rows from the remaining partitions.

Any valid query against a partitioned table can be rewritten with a `PARTITION` option to restrict the result to one or more desired partitions. You can use `WHERE` conditions, `ORDER BY` and `LIMIT` options, and so on. You can also use aggregate functions with `HAVING` and `GROUP BY` options. Each of the following queries produces a valid result when run on the `employees` table as previously defined:

```
mysql> SELECT * FROM employees PARTITION (p0, p2)
 -> WHERE lname LIKE 'S%';
+----+-----+-----+-----+
| id | fname | lname | store_id | department_id |
+----+-----+-----+-----+
| 4 | Jim | Smith | 2 | 4 |
| 11 | Jill | Stone | 1 | 4 |
+----+-----+-----+-----+
2 rows in set (0.00 sec)

mysql> SELECT id, CONCAT(fname, ' ', lname) AS name
 -> FROM employees PARTITION (p0) ORDER BY lname;
+----+-----+
| id | name |
+----+-----+
| 3 | Ellen Johnson |
| 4 | Jim Smith |
| 1 | Bob Taylor |
| 2 | Frank Williams |
+----+-----+
4 rows in set (0.06 sec)

mysql> SELECT store_id, COUNT(department_id) AS c
 -> FROM employees PARTITION (p1,p2,p3)
 -> GROUP BY store_id HAVING c > 4;
+----+-----+
| c | store_id |
+----+-----+
| 5 | 2 |
| 5 | 3 |
+----+-----+
2 rows in set (0.00 sec)
```

Statements using partition selection can be employed with tables using any of the supported partitioning types. When a table is created using `[LINEAR] HASH` or `[LINEAR] KEY` partitioning and the names of the partitions are not specified, MySQL automatically names the partitions `p0, p1, p2, ..., pN-1`, where `N` is the number of partitions. For subpartitions not explicitly named, MySQL assigns automatically to the subpartitions in each partition `pX` the names `pXsp0, pXsp1, pXsp2, ..., pXspM-1`, where `M` is the number of subpartitions. When executing against this table a `SELECT` (or other SQL

statement for which explicit partition selection is allowed), you can use these generated names in a `PARTITION` option, as shown here:

```
mysql> CREATE TABLE employees_sub (
 -> id INT NOT NULL AUTO_INCREMENT,
 -> fname VARCHAR(25) NOT NULL,
 -> lname VARCHAR(25) NOT NULL,
 -> store_id INT NOT NULL,
 -> department_id INT NOT NULL,
 -> PRIMARY KEY pk (id, lname)
 ->)
 -> PARTITION BY RANGE(id)
 -> SUBPARTITION BY KEY (lname)
 -> SUBPARTITIONS 2 (
 -> PARTITION p0 VALUES LESS THAN (5),
 -> PARTITION p1 VALUES LESS THAN (10),
 -> PARTITION p2 VALUES LESS THAN (15),
 -> PARTITION p3 VALUES LESS THAN MAXVALUE
 ->);
Query OK, 0 rows affected (1.14 sec)

mysql> INSERT INTO employees_sub # reuse data in employees table
 -> SELECT * FROM employees;
Query OK, 18 rows affected (0.09 sec)
Records: 18 Duplicates: 0 Warnings: 0

mysql> SELECT id, CONCAT(fname, ' ', lname) AS name
 -> FROM employees_sub PARTITION (p2sp1);
+----+-----+
| id | name |
+----+-----+
| 10 | Lou Waters |
| 14 | Fred Goldberg |
+----+-----+
2 rows in set (0.00 sec)
```

You may also use a `PARTITION` option in the `SELECT` portion of an `INSERT ... SELECT` statement, as shown here:

```
mysql> CREATE TABLE employees_copy LIKE employees;
Query OK, 0 rows affected (0.28 sec)

mysql> INSERT INTO employees_copy
 -> SELECT * FROM employees PARTITION (p2);
Query OK, 5 rows affected (0.04 sec)
Records: 5 Duplicates: 0 Warnings: 0

mysql> SELECT * FROM employees_copy;
+----+-----+-----+-----+-----+
| id | fname | lname | store_id | department_id |
+----+-----+-----+-----+-----+
| 10 | Lou | Waters | 2 | 4 |
| 11 | Jill | Stone | 1 | 4 |
| 12 | Roger | White | 3 | 2 |
| 13 | Howard | Andrews | 1 | 2 |
| 14 | Fred | Goldberg | 3 | 3 |
+----+-----+-----+-----+-----+
5 rows in set (0.00 sec)
```

Partition selection can also be used with joins. Suppose we create and populate two tables using the statements shown here:

```
CREATE TABLE stores (
 id INT NOT NULL AUTO_INCREMENT PRIMARY KEY,
 city VARCHAR(30) NOT NULL
)
PARTITION BY HASH(id)
PARTITIONS 2;

INSERT INTO stores VALUES
 ('', 'Nambucca'), ('', 'Uranga'),
```

```

('', 'Bellingen'), ('', 'Grafton');

CREATE TABLE departments (
 id INT NOT NULL AUTO_INCREMENT PRIMARY KEY,
 name VARCHAR(30) NOT NULL
)
PARTITION BY KEY(id)
PARTITIONS 2;

INSERT INTO departments VALUES
('', 'Sales'), ('', 'Customer Service'),
('', 'Delivery'), ('', 'Accounting');

```

You can explicitly select partitions (or subpartitions, or both) from any or all of the tables in a join. (The `PARTITION` option used to select partitions from a given table immediately follows the name of the table, before all other options, including any table alias.) For example, the following query gets the name, employee ID, department, and city of all employees who work in the Sales or Delivery department (partition `p1` of the `departments` table) at the stores in either of the cities of Nambucca and Bellingen (partition `p0` of the `stores` table):

```

mysql> SELECT
-> e.id AS 'Employee ID', CONCAT(e.fname, ' ', e.lname) AS Name,
-> s.city AS City, d.name AS department
-> FROM employees AS e
-> JOIN stores PARTITION (p1) AS s ON e.store_id=s.id
-> JOIN departments PARTITION (p0) AS d ON e.department_id=d.id
-> ORDER BY e.lname;
+-----+-----+-----+-----+
| Employee ID | Name | City | department |
+-----+-----+-----+-----+
| 14 | Fred Goldberg | Bellingen | Delivery |
| 5 | Mary Jones | Nambucca | Sales |
| 17 | Mark Morgan | Bellingen | Delivery |
| 9 | Andy Smith | Nambucca | Delivery |
| 8 | June Wilson | Bellingen | Sales |
+-----+-----+-----+-----+
5 rows in set (0.00 sec)

```

For general information about joins in MySQL, see [Section 15.2.13.2, “JOIN Clause”](#).

When the `PARTITION` option is used with `DELETE` statements, only those partitions (and subpartitions, if any) listed with the option are checked for rows to be deleted. Any other partitions are ignored, as shown here:

```

mysql> SELECT * FROM employees WHERE fname LIKE 'j%';
+-----+-----+-----+-----+
| id | fname | lname | store_id | department_id |
+-----+-----+-----+-----+
| 4 | Jim | Smith | 2 | 4 |
| 8 | June | Wilson| 3 | 1 |
| 11 | Jill | Stone | 1 | 4 |
+-----+-----+-----+-----+
3 rows in set (0.00 sec)

mysql> DELETE FROM employees PARTITION (p0, p1)
-> WHERE fname LIKE 'j%';
Query OK, 2 rows affected (0.09 sec)

mysql> SELECT * FROM employees WHERE fname LIKE 'j%';
+-----+-----+-----+-----+
| id | fname | lname | store_id | department_id |
+-----+-----+-----+-----+
| 11 | Jill | Stone | 1 | 4 |
+-----+-----+-----+-----+
1 row in set (0.00 sec)

```

Only the two rows in partitions `p0` and `p1` matching the `WHERE` condition were deleted. As you can see from the result when the `SELECT` is run a second time, there remains a row in the table matching the `WHERE` condition, but residing in a different partition (`p2`).

`UPDATE` statements using explicit partition selection behave in the same way; only rows in the partitions referenced by the `PARTITION` option are considered when determining the rows to be updated, as can be seen by executing the following statements:

```
mysql> UPDATE employees PARTITION (p0)
 -> SET store_id = 2 WHERE fname = 'Jill';
Query OK, 0 rows affected (0.00 sec)
Rows matched: 0 Changed: 0 Warnings: 0

mysql> SELECT * FROM employees WHERE fname = 'Jill';
+----+----+----+----+
| id | fname | lname | store_id | department_id |
+----+----+----+----+
| 11 | Jill | Stone | 1 | 4 |
+----+----+----+----+
1 row in set (0.00 sec)

mysql> UPDATE employees PARTITION (p2)
 -> SET store_id = 2 WHERE fname = 'Jill';
Query OK, 1 row affected (0.09 sec)
Rows matched: 1 Changed: 1 Warnings: 0

mysql> SELECT * FROM employees WHERE fname = 'Jill';
+----+----+----+----+
| id | fname | lname | store_id | department_id |
+----+----+----+----+
| 11 | Jill | Stone | 2 | 4 |
+----+----+----+----+
1 row in set (0.00 sec)
```

In the same way, when `PARTITION` is used with `DELETE`, only rows in the partition or partitions named in the partition list are checked for deletion.

For statements that insert rows, the behavior differs in that failure to find a suitable partition causes the statement to fail. This is true for both `INSERT` and `REPLACE` statements, as shown here:

```
mysql> INSERT INTO employees PARTITION (p2) VALUES (20, 'Jan', 'Jones', 1, 3);
ERROR 1729 (HY000): Found a row not matching the given partition set
mysql> INSERT INTO employees PARTITION (p3) VALUES (20, 'Jan', 'Jones', 1, 3);
Query OK, 1 row affected (0.07 sec)

mysql> REPLACE INTO employees PARTITION (p0) VALUES (20, 'Jan', 'Jones', 3, 2);
ERROR 1729 (HY000): Found a row not matching the given partition set

mysql> REPLACE INTO employees PARTITION (p3) VALUES (20, 'Jan', 'Jones', 3, 2);
Query OK, 2 rows affected (0.09 sec)
```

For statements that write multiple rows to a partitioned table that using the `InnoDB` storage engine: If any row in the list following `VALUES` cannot be written to one of the partitions specified in the `partition_names` list, the entire statement fails and no rows are written. This is shown for `INSERT` statements in the following example, reusing the `employees` table created previously:

```
mysql> ALTER TABLE employees
 -> REORGANIZE PARTITION p3 INTO (
 -> PARTITION p3 VALUES LESS THAN (20),
 -> PARTITION p4 VALUES LESS THAN (25),
 -> PARTITION p5 VALUES LESS THAN MAXVALUE
 ->);
Query OK, 6 rows affected (2.09 sec)
Records: 6 Duplicates: 0 Warnings: 0

mysql> SHOW CREATE TABLE employees\G
***** 1. row *****
 Table: employees
Create Table: CREATE TABLE `employees` (
 `id` int(11) NOT NULL AUTO_INCREMENT,
 `fname` varchar(25) NOT NULL,
 `lname` varchar(25) NOT NULL,
 `store_id` int(11) NOT NULL,
 `department_id` int(11) NOT NULL,
```

```

 PRIMARY KEY (`id`)
) ENGINE=InnoDB AUTO_INCREMENT=27 DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_0900_ai_ci
/*!50100 PARTITION BY RANGE (id)
(PARTITION p0 VALUES LESS THAN (5) ENGINE = InnoDB,
 PARTITION p1 VALUES LESS THAN (10) ENGINE = InnoDB,
 PARTITION p2 VALUES LESS THAN (15) ENGINE = InnoDB,
 PARTITION p3 VALUES LESS THAN (20) ENGINE = InnoDB,
 PARTITION p4 VALUES LESS THAN (25) ENGINE = InnoDB,
 PARTITION p5 VALUES LESS THAN MAXVALUE ENGINE = InnoDB) */
1 row in set (0.00 sec)

mysql> INSERT INTO employees PARTITION (p3, p4) VALUES
-> (24, 'Tim', 'Greene', 3, 1), (26, 'Linda', 'Mills', 2, 1);
ERROR 1729 (HY000): Found a row not matching the given partition set

mysql> INSERT INTO employees PARTITION (p3, p4, p5) VALUES
-> (24, 'Tim', 'Greene', 3, 1), (26, 'Linda', 'Mills', 2, 1);
Query OK, 2 rows affected (0.06 sec)
Records: 2 Duplicates: 0 Warnings: 0

```

The preceding is true for both `INSERT` statements and `REPLACE` statements that write multiple rows.

Partition selection is disabled for tables employing a storage engine that supplies automatic partitioning, such as `NDB`.

## 26.6 Restrictions and Limitations on Partitioning

This section discusses current restrictions and limitations on MySQL partitioning support.

**Prohibited constructs.** The following constructs are not permitted in partitioning expressions:

- Stored procedures, stored functions, loadable functions, or plugins.
- Declared variables or user variables.

For a list of SQL functions which are permitted in partitioning expressions, see [Section 26.6.3, “Partitioning Limitations Relating to Functions”](#).

**Arithmetic and logical operators.** Use of the arithmetic operators `+`, `-`, and `*` is permitted in partitioning expressions. However, the result must be an integer value or `NULL` (except in the case of `[LINEAR] KEY` partitioning, as discussed elsewhere in this chapter; see [Section 26.2, “Partitioning Types”](#), for more information).

The `DIV` operator is also supported; the `/` operator is not permitted.

The bit operators `|`, `&`, `^`, `<<`, `>>`, and `~` are not permitted in partitioning expressions.

**Server SQL mode.** Tables employing user-defined partitioning do not preserve the SQL mode in effect at the time that they were created. As discussed elsewhere in this Manual (see [Section 7.1.11, “Server SQL Modes”](#)), the results of many MySQL functions and operators may change according to the server SQL mode. Therefore, a change in the SQL mode at any time after the creation of partitioned tables may lead to major changes in the behavior of such tables, and could easily lead to corruption or loss of data. For these reasons, *it is strongly recommended that you never change the server SQL mode after creating partitioned tables*.

For one such change in the server SQL mode making a partitioned tables unusable, consider the following `CREATE TABLE` statement, which can be executed successfully only if the `NO_UNSIGNED_SUBTRACTION` mode is in effect:

```

mysql> SELECT @@sql_mode;
+-----+
| @@sql_mode |
+-----+
| |
+-----+
1 row in set (0.00 sec)

```

```

mysql> CREATE TABLE tu (c1 BIGINT UNSIGNED)
 -> PARTITION BY RANGE(c1 - 10) (
 -> PARTITION p0 VALUES LESS THAN (-5),
 -> PARTITION p1 VALUES LESS THAN (0),
 -> PARTITION p2 VALUES LESS THAN (5),
 -> PARTITION p3 VALUES LESS THAN (10),
 -> PARTITION p4 VALUES LESS THAN (MAXVALUE)
 ->);
ERROR 1563 (HY000): Partition constant is out of partition function domain

mysql> SET sql_mode='NO_UNSIGNED_SUBTRACTION';
Query OK, 0 rows affected (0.00 sec)

mysql> SELECT @@sql_mode;
+-----+
| @@sql_mode |
+-----+
| NO_UNSIGNED_SUBTRACTION |
+-----+
1 row in set (0.00 sec)

mysql> CREATE TABLE tu (c1 BIGINT UNSIGNED)
 -> PARTITION BY RANGE(c1 - 10) (
 -> PARTITION p0 VALUES LESS THAN (-5),
 -> PARTITION p1 VALUES LESS THAN (0),
 -> PARTITION p2 VALUES LESS THAN (5),
 -> PARTITION p3 VALUES LESS THAN (10),
 -> PARTITION p4 VALUES LESS THAN (MAXVALUE)
 ->);
Query OK, 0 rows affected (0.05 sec)

```

If you remove the `NO_UNSIGNED_SUBTRACTION` server SQL mode after creating `tu`, you may no longer be able to access this table:

```

mysql> SET sql_mode='';
Query OK, 0 rows affected (0.00 sec)

mysql> SELECT * FROM tu;
ERROR 1563 (HY000): Partition constant is out of partition function domain
mysql> INSERT INTO tu VALUES (20);
ERROR 1563 (HY000): Partition constant is out of partition function domain

```

See also [Section 7.1.11, “Server SQL Modes”](#).

Server SQL modes also impact replication of partitioned tables. Disparate SQL modes on source and replica can lead to partitioning expressions being evaluated differently; this can cause the distribution of data among partitions to be different in the source's and replica's copies of a given table, and may even cause inserts into partitioned tables that succeed on the source to fail on the replica. For best results, you should always use the same server SQL mode on the source and on the replica.

**Performance considerations.** Some effects of partitioning operations on performance are given in the following list:

- **File system operations.** Partitioning and repartitioning operations (such as `ALTER TABLE` with `PARTITION BY ...`, `REORGANIZE PARTITION`, or `REMOVE PARTITIONING`) depend on file system operations for their implementation. This means that the speed of these operations is affected by such factors as file system type and characteristics, disk speed, swap space, file handling efficiency of the operating system, and MySQL server options and variables that relate to file handling. In particular, you should make sure that `large_files_support` is enabled and that `open_files_limit` is set properly. Partitioning and repartitioning operations involving `InnoDB` tables may be made more efficient by enabling `innodb_file_per_table`.

See also [Maximum number of partitions](#).

- **Table locks.** Generally, the process executing a partitioning operation on a table takes a write lock on the table. Reads from such tables are relatively unaffected; pending `INSERT` and `UPDATE`

operations are performed as soon as the partitioning operation has completed. For [InnoDB-specific exceptions](#) to this limitation, see [Partitioning Operations](#).

- **Indexes; partition pruning.** As with nonpartitioned tables, proper use of indexes can speed up queries on partitioned tables significantly. In addition, designing partitioned tables and queries on these tables to take advantage of *partition pruning* can improve performance dramatically. See [Section 26.4, “Partition Pruning”](#), for more information.

Index condition pushdown is supported for partitioned tables. See [Section 10.2.1.6, “Index Condition Pushdown Optimization”](#).

- **Performance with LOAD DATA.** In MySQL 8.4, `LOAD DATA` uses buffering to improve performance. You should be aware that the buffer uses 130 KB memory per partition to achieve this.

#### Maximum number of partitions.

The maximum possible number of partitions for a given table not using the [NDB storage engine](#) is 8192. This number includes subpartitions.

The maximum possible number of user-defined partitions for a table using the [NDB storage engine](#) is determined according to the version of the NDB Cluster software being used, the number of data nodes, and other factors. See [NDB and user-defined partitioning](#), for more information.

If, when creating tables with a large number of partitions (but less than the maximum), you encounter an error message such as `Got error ... from storage engine: Out of resources when opening file`, you may be able to address the issue by increasing the value of the `open_files_limit` system variable. However, this is dependent on the operating system, and may not be possible or advisable on all platforms; see [Section B.3.2.16, “File Not Found and Similar Errors”](#), for more information. In some cases, using large numbers (hundreds) of partitions may also not be advisable due to other concerns, so using more partitions does not automatically lead to better results.

See also [File system operations](#).

#### Foreign keys not supported for partitioned InnoDB tables.

Partitioned tables using the [InnoDB storage engine](#) do not support foreign keys. More specifically, this means that the following two statements are true:

1. No definition of an [InnoDB](#) table employing user-defined partitioning may contain foreign key references; no [Innodb](#) table whose definition contains foreign key references may be partitioned.
2. No [InnoDB](#) table definition may contain a foreign key reference to a user-partitioned table; no [InnoDB](#) table with user-defined partitioning may contain columns referenced by foreign keys.

The scope of the restrictions just listed includes all tables that use the [InnoDB storage engine](#). `CREATE TABLE` and `ALTER TABLE` statements that would result in tables violating these restrictions are not allowed.

**ALTER TABLE ... ORDER BY.** An `ALTER TABLE ... ORDER BY column` statement run against a partitioned table causes ordering of rows only within each partition.

**ADD COLUMN ... ALGORITHM=INSTANT.** Once you perform `ALTER TABLE ... ADD COLUMN ... ALGORITHM=INSTANT` on a partitioned table, it is no longer possible to exchange partitions with this table.

**Effects on REPLACE statements by modification of primary keys.** It can be desirable in some cases (see [Section 26.6.1, “Partitioning Keys, Primary Keys, and Unique Keys”](#)) to modify a table's primary key. Be aware that, if your application uses `REPLACE` statements and you do this, the results of these statements can be drastically altered. See [Section 15.2.12, “REPLACE Statement”](#), for more information and an example.

#### FULLTEXT indexes.

Partitioned tables do not support `FULLTEXT` indexes or searches.

**Spatial columns.** Columns with spatial data types such as `POINT` or `GEOMETRY` cannot be used in partitioned tables.

### Temporary tables.

Temporary tables cannot be partitioned.

**Log tables.** It is not possible to partition the log tables; an `ALTER TABLE ... PARTITION BY ...` statement on such a table fails with an error.

### Data type of partitioning key.

A partitioning key must be either an integer column or an expression that resolves to an integer. Expressions employing `ENUM` columns cannot be used. The column or expression value may also be `NULL`; see [Section 26.2.7, “How MySQL Partitioning Handles NULL”](#).

There are two exceptions to this restriction:

- When partitioning by `[LINEAR] KEY`, it is possible to use columns of any valid MySQL data type other than `TEXT` or `BLOB` as partitioning keys, because the internal key-hashing functions produce the correct data type from these types. For example, the following two `CREATE TABLE` statements are valid:

```
CREATE TABLE tkc (c1 CHAR)
PARTITION BY KEY(c1)
PARTITIONS 4;

CREATE TABLE tke
 (c1 ENUM('red', 'orange', 'yellow', 'green', 'blue', 'indigo', 'violet'))
PARTITION BY LINEAR KEY(c1)
PARTITIONS 6;
```

- When partitioning by `RANGE COLUMNS` or `LIST COLUMNS`, it is possible to use string, `DATE`, and `DATETIME` columns. For example, each of the following `CREATE TABLE` statements is valid:

```
CREATE TABLE rc (c1 INT, c2 DATE)
PARTITION BY RANGE COLUMNS(c2) (
 PARTITION p0 VALUES LESS THAN('1990-01-01'),
 PARTITION p1 VALUES LESS THAN('1995-01-01'),
 PARTITION p2 VALUES LESS THAN('2000-01-01'),
 PARTITION p3 VALUES LESS THAN('2005-01-01'),
 PARTITION p4 VALUES LESS THAN(MAXVALUE)
);

CREATE TABLE lc (c1 INT, c2 CHAR(1))
PARTITION BY LIST COLUMNS(c2) (
 PARTITION p0 VALUES IN('a', 'd', 'g', 'j', 'm', 'p', 's', 'v', 'y'),
 PARTITION p1 VALUES IN('b', 'e', 'h', 'k', 'n', 'q', 't', 'w', 'z'),
 PARTITION p2 VALUES IN('c', 'f', 'i', 'l', 'o', 'r', 'u', 'x', NULL)
);
```

Neither of the preceding exceptions applies to `BLOB` or `TEXT` column types.

### Subqueries.

A partitioning key may not be a subquery, even if that subquery resolves to an integer value or `NULL`.

**Column index prefixes not supported for key partitioning.** When creating a table that is partitioned by key, any columns in the partitioning key which use column prefixes are not allowed in the table's partitioning function. Consider the following `CREATE TABLE` statement, which has three `VARCHAR` columns, and whose primary key uses all three columns and specifies a prefix for one of them. This statement is rejected with an error, as shown here:

```
mysql> USE d;
Database changed
mysql> CREATE TABLE t1 (
 -> a VARCHAR(10000),
 -> b VARCHAR(25),
 -> c VARCHAR(10),
```

```

-> PRIMARY KEY (a(10), b, c)
->) PARTITION BY KEY() PARTITIONS 2;
ERROR 6123 (HY000): Column 'd.t1.a' having prefix key part 'a(10)' in the
PARTITION BY KEY() clause is not supported.

```

For general information about partitioning tables by key, see [Section 26.2.5, “KEY Partitioning”](#).

### Issues with subpartitions.

Subpartitions must use `HASH` or `KEY` partitioning. Only `RANGE` and `LIST` partitions may be subpartitioned; `HASH` and `KEY` partitions cannot be subpartitioned.

`SUBPARTITION BY KEY` requires that the subpartitioning column or columns be specified explicitly, unlike the case with `PARTITION BY KEY`, where it can be omitted (in which case the table's primary key column is used by default). Consider the table created by this statement:

```

CREATE TABLE ts (
 id INT NOT NULL AUTO_INCREMENT PRIMARY KEY,
 name VARCHAR(30)
);

```

You can create a table having the same columns, partitioned by `KEY`, using a statement such as this one:

```

CREATE TABLE ts (
 id INT NOT NULL AUTO_INCREMENT PRIMARY KEY,
 name VARCHAR(30)
)
PARTITION BY KEY()
PARTITIONS 4;

```

The previous statement is treated as though it had been written like this, with the table's primary key column used as the partitioning column:

```

CREATE TABLE ts (
 id INT NOT NULL AUTO_INCREMENT PRIMARY KEY,
 name VARCHAR(30)
)
PARTITION BY KEY(id)
PARTITIONS 4;

```

However, the following statement that attempts to create a subpartitioned table using the default column as the subpartitioning column fails, and the column must be specified for the statement to succeed, as shown here:

```

mysql> CREATE TABLE ts (
-> id INT NOT NULL AUTO_INCREMENT PRIMARY KEY,
-> name VARCHAR(30)
->)
-> PARTITION BY RANGE(id)
-> SUBPARTITION BY KEY()
-> SUBPARTITIONS 4
-> (
-> PARTITION p0 VALUES LESS THAN (100),
-> PARTITION p1 VALUES LESS THAN (MAXVALUE)
->);
ERROR 1064 (42000): You have an error in your SQL syntax; check the manual that
corresponds to your MySQL server version for the right syntax to use near ')'

mysql> CREATE TABLE ts (
-> id INT NOT NULL AUTO_INCREMENT PRIMARY KEY,
-> name VARCHAR(30)
->)
-> PARTITION BY RANGE(id)
-> SUBPARTITION BY KEY(id)
-> SUBPARTITIONS 4
-> (
-> PARTITION p0 VALUES LESS THAN (100),
-> PARTITION p1 VALUES LESS THAN (MAXVALUE)

```

```
->);
Query OK, 0 rows affected (0.07 sec)
```

This is a known issue (see Bug #51470).

**DATA DIRECTORY and INDEX DIRECTORY options.** Table-level `DATA DIRECTORY` and `INDEX DIRECTORY` options are ignored (see Bug #32091). You can employ these options for individual partitions or subpartitions of `InnoDB` tables. The directory specified in a `DATA DIRECTORY` clause must be known to `InnoDB`. For more information, see [Using the DATA DIRECTORY Clause](#).

**Repairing and rebuilding partitioned tables.** The statements `CHECK TABLE`, `OPTIMIZE TABLE`, `ANALYZE TABLE`, and `REPAIR TABLE` are supported for partitioned tables.

In addition, you can use `ALTER TABLE ... REBUILD PARTITION` to rebuild one or more partitions of a partitioned table; `ALTER TABLE ... REORGANIZE PARTITION` also causes partitions to be rebuilt. See [Section 15.1.9, “ALTER TABLE Statement”](#), for more information about these two statements.

`ANALYZE`, `CHECK`, `OPTIMIZE`, `REPAIR`, and `TRUNCATE` operations are supported with subpartitions. See [Section 15.1.9.1, “ALTER TABLE Partition Operations”](#).

**File name delimiters for partitions and subpartitions.** Table partition and subpartition file names include generated delimiters such as `#P#` and `#SP#`. The lettercase of such delimiters can vary and should not be depended upon.

## 26.6.1 Partitioning Keys, Primary Keys, and Unique Keys

This section discusses the relationship of partitioning keys with primary keys and unique keys. The rule governing this relationship can be expressed as follows: All columns used in the partitioning expression for a partitioned table must be part of every unique key that the table may have.

In other words, *every unique key on the table must use every column in the table's partitioning expression.* (This also includes the table's primary key, since it is by definition a unique key. This particular case is discussed later in this section.) For example, each of the following table creation statements is invalid:

```
CREATE TABLE t1 (
 col1 INT NOT NULL,
 col2 DATE NOT NULL,
 col3 INT NOT NULL,
 col4 INT NOT NULL,
 UNIQUE KEY (col1, col2)
)
PARTITION BY HASH(col3)
PARTITIONS 4;

CREATE TABLE t2 (
 col1 INT NOT NULL,
 col2 DATE NOT NULL,
 col3 INT NOT NULL,
 col4 INT NOT NULL,
 UNIQUE KEY (col1),
 UNIQUE KEY (col3)
)
PARTITION BY HASH(col1 + col3)
PARTITIONS 4;
```

In each case, the proposed table would have at least one unique key that does not include all columns used in the partitioning expression.

Each of the following statements is valid, and represents one way in which the corresponding invalid table creation statement could be made to work:

```
CREATE TABLE t1 (
```

```

 col1 INT NOT NULL,
 col2 DATE NOT NULL,
 col3 INT NOT NULL,
 col4 INT NOT NULL,
 UNIQUE KEY (col1, col2, col3)
)
PARTITION BY HASH(col3)
PARTITIONS 4;

CREATE TABLE t2 (
 col1 INT NOT NULL,
 col2 DATE NOT NULL,
 col3 INT NOT NULL,
 col4 INT NOT NULL,
 UNIQUE KEY (col1, col3)
)
PARTITION BY HASH(col1 + col3)
PARTITIONS 4;

```

This example shows the error produced in such cases:

```

mysql> CREATE TABLE t3 (
-> col1 INT NOT NULL,
-> col2 DATE NOT NULL,
-> col3 INT NOT NULL,
-> col4 INT NOT NULL,
-> UNIQUE KEY (col1, col2),
-> UNIQUE KEY (col3)
->)
-> PARTITION BY HASH(col1 + col3)
-> PARTITIONS 4;
ERROR 1491 (HY000): A PRIMARY KEY must include all columns in the table's partitioning function

```

The `CREATE TABLE` statement fails because both `col1` and `col3` are included in the proposed partitioning key, but neither of these columns is part of both of unique keys on the table. This shows one possible fix for the invalid table definition:

```

mysql> CREATE TABLE t3 (
-> col1 INT NOT NULL,
-> col2 DATE NOT NULL,
-> col3 INT NOT NULL,
-> col4 INT NOT NULL,
-> UNIQUE KEY (col1, col2, col3),
-> UNIQUE KEY (col3)
->)
-> PARTITION BY HASH(col3)
-> PARTITIONS 4;
Query OK, 0 rows affected (0.05 sec)

```

In this case, the proposed partitioning key `col3` is part of both unique keys, and the table creation statement succeeds.

The following table cannot be partitioned at all, because there is no way to include in a partitioning key any columns that belong to both unique keys:

```

CREATE TABLE t4 (
 col1 INT NOT NULL,
 col2 INT NOT NULL,
 col3 INT NOT NULL,
 col4 INT NOT NULL,
 UNIQUE KEY (col1, col3),
 UNIQUE KEY (col2, col4)
);

```

Since every primary key is by definition a unique key, this restriction also includes the table's primary key, if it has one. For example, the next two statements are invalid:

```

CREATE TABLE t5 (
 col1 INT NOT NULL,
 col2 DATE NOT NULL,

```

```

 col3 INT NOT NULL,
 col4 INT NOT NULL,
 PRIMARY KEY(col1, col2)
)
PARTITION BY HASH(col3)
PARTITIONS 4;

CREATE TABLE t6 (
 col1 INT NOT NULL,
 col2 DATE NOT NULL,
 col3 INT NOT NULL,
 col4 INT NOT NULL,
 PRIMARY KEY(col1, col3),
 UNIQUE KEY(col2)
)
PARTITION BY HASH(YEAR(col2))
PARTITIONS 4;

```

In both cases, the primary key does not include all columns referenced in the partitioning expression. However, both of the next two statements are valid:

```

CREATE TABLE t7 (
 col1 INT NOT NULL,
 col2 DATE NOT NULL,
 col3 INT NOT NULL,
 col4 INT NOT NULL,
 PRIMARY KEY(col1, col2)
)
PARTITION BY HASH(col1 + YEAR(col2))
PARTITIONS 4;

CREATE TABLE t8 (
 col1 INT NOT NULL,
 col2 DATE NOT NULL,
 col3 INT NOT NULL,
 col4 INT NOT NULL,
 PRIMARY KEY(col1, col2, col4),
 UNIQUE KEY(col2, col1)
)
PARTITION BY HASH(col1 + YEAR(col2))
PARTITIONS 4;

```

If a table has no unique keys—this includes having no primary key—then this restriction does not apply, and you may use any column or columns in the partitioning expression as long as the column type is compatible with the partitioning type.

For the same reason, you cannot later add a unique key to a partitioned table unless the key includes all columns used by the table's partitioning expression. Consider the partitioned table created as shown here:

```

mysql> CREATE TABLE t_no_pk (c1 INT, c2 INT)
-> PARTITION BY RANGE(c1) (
-> PARTITION p0 VALUES LESS THAN (10),
-> PARTITION p1 VALUES LESS THAN (20),
-> PARTITION p2 VALUES LESS THAN (30),
-> PARTITION p3 VALUES LESS THAN (40)
->);
Query OK, 0 rows affected (0.12 sec)

```

It is possible to add a primary key to `t_no_pk` using either of these `ALTER TABLE` statements:

```

possible PK
mysql> ALTER TABLE t_no_pk ADD PRIMARY KEY(c1);
Query OK, 0 rows affected (0.13 sec)
Records: 0 Duplicates: 0 Warnings: 0

drop this PK
mysql> ALTER TABLE t_no_pk DROP PRIMARY KEY;
Query OK, 0 rows affected (0.10 sec)
Records: 0 Duplicates: 0 Warnings: 0

```

```
use another possible PK
mysql> ALTER TABLE t_no_pk ADD PRIMARY KEY(c1, c2);
Query OK, 0 rows affected (0.12 sec)
Records: 0 Duplicates: 0 Warnings: 0

drop this PK
mysql> ALTER TABLE t_no_pk DROP PRIMARY KEY;
Query OK, 0 rows affected (0.09 sec)
Records: 0 Duplicates: 0 Warnings: 0
```

However, the next statement fails, because `c1` is part of the partitioning key, but is not part of the proposed primary key:

```
fails with error 1503
mysql> ALTER TABLE t_no_pk ADD PRIMARY KEY(c2);
ERROR 1503 (HY000): A PRIMARY KEY must include all columns in the table's partitioning function
```

Since `t_no_pk` has only `c1` in its partitioning expression, attempting to adding a unique key on `c2` alone fails. However, you can add a unique key that uses both `c1` and `c2`.

These rules also apply to existing nonpartitioned tables that you wish to partition using `ALTER TABLE ... PARTITION BY`. Consider a table `np_pk` created as shown here:

```
mysql> CREATE TABLE np_pk (
 -> id INT NOT NULL AUTO_INCREMENT,
 -> name VARCHAR(50),
 -> added DATE,
 -> PRIMARY KEY (id)
 ->);
Query OK, 0 rows affected (0.08 sec)
```

The following `ALTER TABLE` statement fails with an error, because the `added` column is not part of any unique key in the table:

```
mysql> ALTER TABLE np_pk
 -> PARTITION BY HASH(TO_DAYS(added))
 -> PARTITIONS 4;
ERROR 1503 (HY000): A PRIMARY KEY must include all columns in the table's partitioning function
```

However, this statement using the `id` column for the partitioning column is valid, as shown here:

```
mysql> ALTER TABLE np_pk
 -> PARTITION BY HASH(id)
 -> PARTITIONS 4;
Query OK, 0 rows affected (0.11 sec)
Records: 0 Duplicates: 0 Warnings: 0
```

In the case of `np_pk`, the only column that may be used as part of a partitioning expression is `id`; if you wish to partition this table using any other column or columns in the partitioning expression, you must first modify the table, either by adding the desired column or columns to the primary key, or by dropping the primary key altogether.

## 26.6.2 Partitioning Limitations Relating to Storage Engines

In MySQL 8.4, partitioning support is not actually provided by the MySQL Server, but rather by a table storage engine's own or native partitioning handler. In MySQL 8.4, only the `InnoDB` and `NDB` storage engines provide native partitioning handlers. This means that partitioned tables cannot be created using any other storage engine than these. (You must be using MySQL NDB Cluster with the `NDB` storage engine to create `NDB` tables.)

**InnoDB storage engine.** `InnoDB` foreign keys and MySQL partitioning are not compatible. Partitioned `InnoDB` tables cannot have foreign key references, nor can they have columns referenced by foreign keys. `InnoDB` tables which have or which are referenced by foreign keys cannot be partitioned.

`ALTER TABLE ... OPTIMIZE PARTITION` does not work correctly with partitioned tables that use `InnoDB`. Use `ALTER TABLE ... REBUILD PARTITION` and `ALTER TABLE ... ANALYZE PARTITION`, instead, for such tables. For more information, see [Section 15.1.9.1, “ALTER TABLE Partition Operations”](#).

**User-defined partitioning and the NDB storage engine (NDB Cluster).** Partitioning by `KEY` (including `LINEAR KEY`) is the only type of partitioning supported for the `NDB` storage engine. It is not possible under normal circumstances in NDB Cluster to create an NDB Cluster table using any partitioning type other than `[LINEAR] KEY`, and attempting to do so fails with an error.

The maximum number of partitions that can be defined for an `NDB` table depends on the number of data nodes and node groups in the cluster, the version of the NDB Cluster software in use, and other factors. See [NDB and user-defined partitioning](#), for more information.

The maximum amount of fixed-size data that can be stored per partition in an `NDB` table is 128 TB. Previously, this was 16 GB.

`CREATE TABLE` and `ALTER TABLE` statements that would cause a user-partitioned `NDB` table not to meet either or both of the following two requirements are not permitted, and fail with an error:

1. The table must have an explicit primary key.
2. All columns listed in the table's partitioning expression must be part of the primary key.

**Exception.** If a user-partitioned `NDB` table is created using an empty column-list (that is, using `PARTITION BY KEY()` or `PARTITION BY LINEAR KEY()`), then no explicit primary key is required.

**Partition selection.** Partition selection is not supported for `NDB` tables. See [Section 26.5, “Partition Selection”](#), for more information.

**Upgrading partitioned tables.** When performing an upgrade, tables which are partitioned by `KEY` must be dumped and reloaded.

For information about converting `MyISAM` tables to `InnoDB`, see [Section 17.6.1.5, “Converting Tables from MyISAM to InnoDB”](#).

### 26.6.3 Partitioning Limitations Relating to Functions

This section discusses limitations in MySQL Partitioning relating specifically to functions used in partitioning expressions.

Only the MySQL functions shown in the following list are allowed in partitioning expressions:

- `ABS()`
- `CEILING()` (see [CEILING\(\) and FLOOR\(\)](#))
- `DATEDIFF()`
- `DAY()`
- `DAYOFMONTH()`
- `DAYOFWEEK()`
- `DAYOFYEAR()`
- `EXTRACT()` (see [EXTRACT\(\) function with WEEK specifier](#))
- `FLOOR()` (see [CEILING\(\) and FLOOR\(\)](#))
- `HOUR()`

- `MICROSECOND()`
- `MINUTE()`
- `MOD()`
- `MONTH()`
- `QUARTER()`
- `SECOND()`
- `TIME_TO_SEC()`
- `TO_DAYS()`
- `TO_SECONDS()`
- `UNIX_TIMESTAMP()` (with `TIMESTAMP` columns)
- `WEEKDAY()`
- `YEAR()`
- `YEARWEEK()`

In MySQL 8.4, partition pruning is supported for the `TO_DAYS()`, `TO_SECONDS()`, `YEAR()`, and `UNIX_TIMESTAMP()` functions. See [Section 26.4, “Partition Pruning”](#), for more information.

**CEILING() and FLOOR().** Each of these functions returns an integer only if it is passed an argument of an exact numeric type, such as one of the `INT` types or `DECIMAL`. This means, for example, that the following `CREATE TABLE` statement fails with an error, as shown here:

```
mysql> CREATE TABLE t (c FLOAT) PARTITION BY LIST(FLOOR(c))(
 -> PARTITION p0 VALUES IN (1,3,5),
 -> PARTITION p1 VALUES IN (2,4,6)
 ->);
ERROR 1490 (HY000): The PARTITION function returns the wrong type
```

**EXTRACT() function with WEEK specifier.** The value returned by the `EXTRACT()` function, when used as `EXTRACT(WEEK FROM col)`, depends on the value of the `default_week_format` system variable. For this reason, `EXTRACT()` is not permitted as a partitioning function when it specifies the unit as `WEEK`. (Bug #54483)

See [Section 14.6.2, “Mathematical Functions”](#), for more information about the return types of these functions, as well as [Section 13.1, “Numeric Data Types”](#).

This chapter discusses stored database objects that are defined in terms of SQL code that is stored on the server for later execution.

Stored objects include these object types:

- Stored procedure: An object created with `CREATE PROCEDURE` and invoked using the `CALL` statement. A procedure does not have a return value but can modify its parameters for later inspection by the caller. It can also generate result sets to be returned to the client program.
- Stored function: An object created with `CREATE FUNCTION` and used much like a built-in function. You invoke it in an expression and it returns a value during expression evaluation.
- Trigger: An object created with `CREATE TRIGGER` that is associated with a table. A trigger is activated when a particular event occurs for the table, such as an insert or update.
- Event: An object created with `CREATE EVENT` and invoked by the server according to schedule.
- View: An object created with `CREATE VIEW` that when referenced produces a result set. A view acts as a virtual table.

Terminology used in this document reflects the stored object hierarchy:

- Stored routines include stored procedures and functions.
- Stored programs include stored routines, triggers, and events.
- Stored objects include stored programs and views.

This chapter describes how to use stored objects. The following sections provide additional information about SQL syntax for statements related to these objects, and about object processing:

- For each object type, there are `CREATE`, `ALTER`, and `DROP` statements that control which objects exist and how they are defined. See [Section 15.1, “Data Definition Statements”](#).
- The `CALL` statement is used to invoke stored procedures. See [Section 15.2.1, “CALL Statement”](#).
- Stored program definitions include a body that may use compound statements, loops, conditionals, and declared variables. See [Section 15.6, “Compound Statement Syntax”](#).
- Metadata changes to objects referred to by stored programs are detected and cause automatic reparsing of the affected statements when the program is next executed. For more information, see [Section 10.10.3, “Caching of Prepared Statements and Stored Programs”](#).

## 27.1 Defining Stored Programs

Each stored program contains a body that consists of an SQL statement. This statement may be a compound statement made up of several statements separated by semicolon (`:`) characters. For example, the following stored procedure has a body made up of a `BEGIN ... END` block that contains a `SET` statement and a `REPEAT` loop that itself contains another `SET` statement:

```
CREATE PROCEDURE dorepeat(p1 INT)
BEGIN
 SET @x = 0;
 REPEAT SET @x = @x + 1; UNTIL @x > p1 END REPEAT;
END;
```

If you use the `mysql` client program to define a stored program containing semicolon characters, a problem arises. By default, `mysql` itself recognizes the semicolon as a statement delimiter, so you must redefine the delimiter temporarily to cause `mysql` to pass the entire stored program definition to the server.

To redefine the `mysql` delimiter, use the `delimiter` command. The following example shows how to do this for the `dorepeat()` procedure just shown. The delimiter is changed to `//` to enable the entire definition to be passed to the server as a single statement, and then restored to `:` before invoking the procedure. This enables the `:` delimiter used in the procedure body to be passed through to the server rather than being interpreted by `mysql` itself.

```
mysql> delimiter //
mysql> CREATE PROCEDURE dorepeat(p1 INT)
-> BEGIN
-> SET @x = 0;
-> REPEAT SET @x = @x + 1; UNTIL @x > p1 END REPEAT;
-> END
-> //
Query OK, 0 rows affected (0.00 sec)

mysql> delimiter ;
mysql> CALL dorepeat(1000);
Query OK, 0 rows affected (0.00 sec)

mysql> SELECT @x;
+-----+
| @x |
+-----+
| 1001 |
+-----+
1 row in set (0.00 sec)
```

You can redefine the delimiter to a string other than `//`, and the delimiter can consist of a single character or multiple characters. You should avoid the use of the backslash (`\`) character because that is the escape character for MySQL.

The following is an example of a function that takes a parameter, performs an operation using an SQL function, and returns the result. In this case, it is unnecessary to use `delimiter` because the function definition contains no internal `:` statement delimiters:

```
mysql> CREATE FUNCTION hello (s CHAR(20))
mysql> RETURNS CHAR(50) DETERMINISTIC
-> RETURN CONCAT('Hello, ',s,'!');
Query OK, 0 rows affected (0.00 sec)

mysql> SELECT hello('world');
+-----+
| hello('world') |
+-----+
| Hello, world! |
+-----+
1 row in set (0.00 sec)
```

## 27.2 Using Stored Routines

MySQL supports stored routines (procedures and functions). A stored routine is a set of SQL statements that can be stored in the server. Once this has been done, clients don't need to keep reissuing the individual statements but can refer to the stored routine instead.

Stored routines can be particularly useful in certain situations:

- When multiple client applications are written in different languages or work on different platforms, but need to perform the same database operations.
- When security is paramount. Banks, for example, use stored procedures and functions for all common operations. This provides a consistent and secure environment, and routines can ensure that each operation is properly logged. In such a setup, applications and users would have no access to the database tables directly, but can only execute specific stored routines.

Stored routines can provide improved performance because less information needs to be sent between the server and the client. The tradeoff is that this does increase the load on the database server because more of the work is done on the server side and less is done on the client (application) side. Consider this if many client machines (such as Web servers) are serviced by only one or a few database servers.

Stored routines also enable you to have libraries of functions in the database server. This is a feature shared by modern application languages that enable such design internally (for example, by using classes). Using these client application language features is beneficial for the programmer even outside the scope of database use.

MySQL follows the SQL:2003 syntax for stored routines, which is also used by IBM's DB2. All syntax described here is supported and any limitations and extensions are documented where appropriate.

## Additional Resources

- You may find the [Stored Procedures User Forum](#) of use when working with stored procedures and functions.
- For answers to some commonly asked questions regarding stored routines in MySQL, see [Section A.4, “MySQL 8.4 FAQ: Stored Procedures and Functions”](#).
- There are some restrictions on the use of stored routines. See [Section 27.8, “Restrictions on Stored Programs”](#).
- Binary logging for stored routines takes place as described in [Section 27.7, “Stored Program Binary Logging”](#).

## 27.2.1 Stored Routine Syntax

A stored routine is either a procedure or a function. Stored routines are created with the [CREATE PROCEDURE](#) and [CREATE FUNCTION](#) statements (see [Section 15.1.17, “CREATE PROCEDURE and CREATE FUNCTION Statements”](#)). A procedure is invoked using a [CALL](#) statement (see [Section 15.2.1, “CALL Statement”](#)), and can only pass back values using output variables. A function can be called from inside a statement just like any other function (that is, by invoking the function's name), and can return a scalar value. The body of a stored routine can use compound statements (see [Section 15.6, “Compound Statement Syntax”](#)).

Stored routines can be dropped with the [DROP PROCEDURE](#) and [DROP FUNCTION](#) statements (see [Section 15.1.29, “DROP PROCEDURE and DROP FUNCTION Statements”](#)), and altered with the [ALTER PROCEDURE](#) and [ALTER FUNCTION](#) statements (see [Section 15.1.7, “ALTER PROCEDURE Statement”](#)).

A stored procedure or function is associated with a particular database. This has several implications:

- When the routine is invoked, an implicit [USE db\\_name](#) is performed (and undone when the routine terminates). [USE](#) statements within stored routines are not permitted.
- You can qualify routine names with the database name. This can be used to refer to a routine that is not in the current database. For example, to invoke a stored procedure `p` or function `f` that is associated with the `test` database, you can say `CALL test.p()` or `test.f()`.
- When a database is dropped, all stored routines associated with it are dropped as well.

Stored functions cannot be recursive.

Recursion in stored procedures is permitted but disabled by default. To enable recursion, set the [max\\_sp\\_recursion\\_depth](#) server system variable to a value greater than zero. Stored procedure recursion increases the demand on thread stack space. If you increase the value of [max\\_sp\\_recursion\\_depth](#), it may be necessary to increase thread stack size by increasing the value of [thread\\_stack](#) at server startup. See [Section 7.1.8, “Server System Variables”](#), for more information.

MySQL supports a very useful extension that enables the use of regular [SELECT](#) statements (that is, without using cursors or local variables) inside a stored procedure. The result set of such a query is simply sent directly to the client. Multiple [SELECT](#) statements generate multiple result sets, so the client must use a MySQL client library that supports multiple result sets. This means the client must use a client library from a version of MySQL at least as recent as 4.1. The client should also specify the [CLIENT\\_MULTI\\_RESULTS](#) option when it connects. For C programs, this can be done with the [mysql\\_real\\_connect\(\)](#) C API function. See [mysql\\_real\\_connect\(\)](#), and [Multiple Statement Execution Support](#).

A user variable referenced by a statement in a stored procedure has its type determined the first time the procedure is invoked, and retains this type each time the procedure is invoked thereafter.

## 27.2.2 Stored Routines and MySQL Privileges

The MySQL grant system takes stored routines into account as follows:

- The [CREATE ROUTINE](#) privilege is needed to create stored routines.
- The [ALTER ROUTINE](#) privilege is needed to alter or drop stored routines. This privilege is granted automatically to the creator of a routine if necessary, and dropped from the creator when the routine is dropped.
- The [EXECUTE](#) privilege is required to execute stored routines. However, this privilege is granted automatically to the creator of a routine if necessary (and dropped from the creator when the routine is dropped). Also, the default [SQL SECURITY](#) characteristic for a routine is [DEFINER](#), which enables users who have access to the database with which the routine is associated to execute the routine.

- If the `automatic_sp_privileges` system variable is 0, the `EXECUTE` and `ALTER ROUTINE` privileges are not automatically granted to and dropped from the routine creator.
- The creator of a routine is the account used to execute the `CREATE` statement for it. This might not be the same as the account named as the `DEFINER` in the routine definition.
- The account named as a routine `DEFINER` can see all routine properties, including its definition. The account thus has full access to the routine output as produced by:
  - The contents of the Information Schema `ROUTINES` table.
  - The `SHOW CREATE FUNCTION` and `SHOW CREATE PROCEDURE` statements.
  - The `SHOW FUNCTION CODE` and `SHOW PROCEDURE CODE` statements.
  - The `SHOW FUNCTION STATUS` and `SHOW PROCEDURE STATUS` statements.
- For an account other than the account named as the routine `DEFINER`, access to routine properties depends on the privileges granted to the account:
  - With the `SHOW_ROUTINE` privilege or the global `SELECT` privilege, the account can see all routine properties, including its definition.
  - With the `CREATE ROUTINE`, `ALTER ROUTINE` or `EXECUTE` privilege granted at a scope that includes the routine, the account can see all routine properties except its definition.

### 27.2.3 Stored Routine Metadata

To obtain metadata about stored routines:

- Query the `ROUTINES` table of the `INFORMATION_SCHEMA` database. See [Section 28.3.30, “The INFORMATION\\_SCHEMA ROUTINES Table”](#).
- Use the `SHOW CREATE PROCEDURE` and `SHOW CREATE FUNCTION` statements to see routine definitions. See [Section 15.7.7.10, “SHOW CREATE PROCEDURE Statement”](#).
- Use the `SHOW PROCEDURE STATUS` and `SHOW FUNCTION STATUS` statements to see routine characteristics. See [Section 15.7.7.30, “SHOW PROCEDURE STATUS Statement”](#).
- Use the `SHOW PROCEDURE CODE` and `SHOW FUNCTION CODE` statements to see a representation of the internal implementation of the routine. See [Section 15.7.7.29, “SHOW PROCEDURE CODE Statement”](#).

### 27.2.4 Stored Procedures, Functions, Triggers, and LAST\_INSERT\_ID()

Within the body of a stored routine (procedure or function) or a trigger, the value of `LAST_INSERT_ID()` changes the same way as for statements executed outside the body of these kinds of objects (see [Section 14.15, “Information Functions”](#)). The effect of a stored routine or trigger upon the value of `LAST_INSERT_ID()` that is seen by following statements depends on the kind of routine:

- If a stored procedure executes statements that change the value of `LAST_INSERT_ID()`, the changed value is seen by statements that follow the procedure call.
- For stored functions and triggers that change the value, the value is restored when the function or trigger ends, so following statements do not see a changed value.

## 27.3 Using Triggers

A trigger is a named database object that is associated with a table, and that activates when a particular event occurs for the table. Some uses for triggers are to perform checks of values to be inserted into a table or to perform calculations on values involved in an update.

A trigger is defined to activate when a statement inserts, updates, or deletes rows in the associated table. These row operations are trigger events. For example, rows can be inserted by `INSERT` or `LOAD DATA` statements, and an insert trigger activates for each inserted row. A trigger can be set to activate either before or after the trigger event. For example, you can have a trigger activate before each row that is inserted into a table or after each row that is updated.

### Important

MySQL triggers activate only for changes made to tables by SQL statements. This includes changes to base tables that underlie updatable views. Triggers do not activate for changes to tables made by APIs that do not transmit SQL statements to the MySQL Server. This means that triggers are not activated by updates made using the `NDB API`.

Triggers are not activated by changes in `INFORMATION_SCHEMA` or `performance_schema` tables. Those tables are actually views and triggers are not permitted on views.

The following sections describe the syntax for creating and dropping triggers, show some examples of how to use them, and indicate how to obtain trigger metadata.

## Additional Resources

- You may find the [MySQL User Forums](#) helpful when working with triggers.
- For answers to commonly asked questions regarding triggers in MySQL, see [Section A.5, “MySQL 8.4 FAQ: Triggers”](#).
- There are some restrictions on the use of triggers; see [Section 27.8, “Restrictions on Stored Programs”](#).
- Binary logging for triggers takes place as described in [Section 27.7, “Stored Program Binary Logging”](#).

### 27.3.1 Trigger Syntax and Examples

To create a trigger or drop a trigger, use the `CREATE TRIGGER` or `DROP TRIGGER` statement, described in [Section 15.1.22, “CREATE TRIGGER Statement”](#), and [Section 15.1.34, “DROP TRIGGER Statement”](#).

Here is a simple example that associates a trigger with a table, to activate for `INSERT` operations. The trigger acts as an accumulator, summing the values inserted into one of the columns of the table.

```
mysql> CREATE TABLE account (acct_num INT, amount DECIMAL(10,2));
Query OK, 0 rows affected (0.03 sec)

mysql> CREATE TRIGGER ins_sum BEFORE INSERT ON account
 FOR EACH ROW SET @sum = @sum + NEW.amount;
Query OK, 0 rows affected (0.01 sec)
```

The `CREATE TRIGGER` statement creates a trigger named `ins_sum` that is associated with the `account` table. It also includes clauses that specify the trigger action time, the triggering event, and what to do when the trigger activates:

- The keyword `BEFORE` indicates the trigger action time. In this case, the trigger activates before each row inserted into the table. The other permitted keyword here is `AFTER`.
- The keyword `INSERT` indicates the trigger event; that is, the type of operation that activates the trigger. In the example, `INSERT` operations cause trigger activation. You can also create triggers for `DELETE` and `UPDATE` operations.
- The statement following `FOR EACH ROW` defines the trigger body; that is, the statement to execute each time the trigger activates, which occurs once for each row affected by the triggering event.

In the example, the trigger body is a simple `SET` that accumulates into a user variable the values inserted into the `amount` column. The statement refers to the column as `NEW.amount` which means "the value of the `amount` column to be inserted into the new row."

To use the trigger, set the accumulator variable to zero, execute an `INSERT` statement, and then see what value the variable has afterward:

```
mysql> SET @sum = 0;
mysql> INSERT INTO account VALUES(137,14.98),(141,1937.50),(97,-100.00);
mysql> SELECT @sum AS 'Total amount inserted';
+-----+
| Total amount inserted |
+-----+
| 1852.48 |
+-----+
```

In this case, the value of `@sum` after the `INSERT` statement has executed is `14.98 + 1937.50 - 100`, or `1852.48`.

To destroy the trigger, use a `DROP TRIGGER` statement. You must specify the schema name if the trigger is not in the default schema:

```
mysql> DROP TRIGGER test.ins_sum;
```

If you drop a table, any triggers for the table are also dropped.

Trigger names exist in the schema namespace, meaning that all triggers must have unique names within a schema. Triggers in different schemas can have the same name.

It is possible to define multiple triggers for a given table that have the same trigger event and action time. For example, you can have two `BEFORE UPDATE` triggers for a table. By default, triggers that have the same trigger event and action time activate in the order they were created. To affect trigger order, specify a clause after `FOR EACH ROW` that indicates `FOLLOWERS` or `PRECEDES` and the name of an existing trigger that also has the same trigger event and action time. With `FOLLOWERS`, the new trigger activates after the existing trigger. With `PRECEDES`, the new trigger activates before the existing trigger.

For example, the following trigger definition defines another `BEFORE INSERT` trigger for the `account` table:

```
mysql> CREATE TRIGGER ins_transaction BEFORE INSERT ON account
 FOR EACH ROW PRECEDES ins_sum
 SET
 @deposits = @deposits + IF(NEW.amount>0,NEW.amount,0),
 @withdrawals = @withdrawals + IF(NEW.amount<0,-NEW.amount,0);
Query OK, 0 rows affected (0.01 sec)
```

This trigger, `ins_transaction`, is similar to `ins_sum` but accumulates deposits and withdrawals separately. It has a `PRECEDES` clause that causes it to activate before `ins_sum`; without that clause, it would activate after `ins_sum` because it is created after `ins_sum`.

Within the trigger body, the `OLD` and `NEW` keywords enable you to access columns in the rows affected by a trigger. `OLD` and `NEW` are MySQL extensions to triggers; they are not case-sensitive.

In an `INSERT` trigger, only `NEW.col_name` can be used; there is no old row. In a `DELETE` trigger, only `OLD.col_name` can be used; there is no new row. In an `UPDATE` trigger, you can use `OLD.col_name` to refer to the columns of a row before it is updated and `NEW.col_name` to refer to the columns of the row after it is updated.

A column named with `OLD` is read only. You can refer to it (if you have the `SELECT` privilege), but not modify it. You can refer to a column named with `NEW` if you have the `SELECT` privilege for it. In a `BEFORE` trigger, you can also change its value with `SET NEW.col_name = value` if you have the `UPDATE` privilege for it. This means you can use a trigger to modify the values to be inserted into a new row or used to update a row. (Such a `SET` statement has no effect in an `AFTER` trigger because the row change has already occurred.)

In a `BEFORE` trigger, the `NEW` value for an `AUTO_INCREMENT` column is 0, not the sequence number that is generated automatically when the new row actually is inserted.

By using the `BEGIN ... END` construct, you can define a trigger that executes multiple statements. Within the `BEGIN` block, you also can use other syntax that is permitted within stored routines such as conditionals and loops. However, just as for stored routines, if you use the `mysql` program to define a trigger that executes multiple statements, it is necessary to redefine the `mysql` statement delimiter so that you can use the `;` statement delimiter within the trigger definition. The following example illustrates these points. It defines an `UPDATE` trigger that checks the new value to be used for updating each row, and modifies the value to be within the range from 0 to 100. This must be a `BEFORE` trigger because the value must be checked before it is used to update the row:

```
mysql> delimiter //
mysql> CREATE TRIGGER upd_check BEFORE UPDATE ON account
 FOR EACH ROW
 BEGIN
 IF NEW.amount < 0 THEN
 SET NEW.amount = 0;
 ELSEIF NEW.amount > 100 THEN
 SET NEW.amount = 100;
 END IF;
 END//;
mysql> delimiter ;
```

It can be easier to define a stored procedure separately and then invoke it from the trigger using a simple `CALL` statement. This is also advantageous if you want to execute the same code from within several triggers.

There are limitations on what can appear in statements that a trigger executes when activated:

- The trigger cannot use the `CALL` statement to invoke stored procedures that return data to the client or that use dynamic SQL. (Stored procedures are permitted to return data to the trigger through `OUT` or `INOUT` parameters.)
- The trigger cannot use statements that explicitly or implicitly begin or end a transaction, such as `START TRANSACTION`, `COMMIT`, or `ROLLBACK`. (`ROLLBACK` to `SAVEPOINT` is permitted because it does not end a transaction.).

See also [Section 27.8, “Restrictions on Stored Programs”](#).

MySQL handles errors during trigger execution as follows:

- If a `BEFORE` trigger fails, the operation on the corresponding row is not performed.
- A `BEFORE` trigger is activated by the *attempt* to insert or modify the row, regardless of whether the attempt subsequently succeeds.
- An `AFTER` trigger is executed only if any `BEFORE` triggers and the row operation execute successfully.
- An error during either a `BEFORE` or `AFTER` trigger results in failure of the entire statement that caused trigger invocation.
- For transactional tables, failure of a statement should cause rollback of all changes performed by the statement. Failure of a trigger causes the statement to fail, so trigger failure also causes rollback. For nontransactional tables, such rollback cannot be done, so although the statement fails, any changes performed prior to the point of the error remain in effect.

Triggers can contain direct references to tables by name, such as the trigger named `testref` shown in this example:

```
CREATE TABLE test1(a1 INT);
CREATE TABLE test2(a2 INT);
CREATE TABLE test3(a3 INT NOT NULL AUTO_INCREMENT PRIMARY KEY);
```

```

CREATE TABLE test4(
 a4 INT NOT NULL AUTO_INCREMENT PRIMARY KEY,
 b4 INT DEFAULT 0
);

delimiter |

CREATE TRIGGER testref BEFORE INSERT ON test1
FOR EACH ROW
BEGIN
 INSERT INTO test2 SET a2 = NEW.a1;
 DELETE FROM test3 WHERE a3 = NEW.a1;
 UPDATE test4 SET b4 = b4 + 1 WHERE a4 = NEW.a1;
END;
|

delimiter ;

```

INSERT INTO test3 (a3) VALUES  
 (NULL), (NULL), (NULL), (NULL), (NULL),  
 (NULL), (NULL), (NULL), (NULL);

INSERT INTO test4 (a4) VALUES  
 (0), (0), (0), (0), (0), (0), (0), (0), (0);

Suppose that you insert the following values into table `test1` as shown here:

```

mysql> INSERT INTO test1 VALUES
 (1), (3), (1), (7), (1), (8), (4), (4);
Query OK, 8 rows affected (0.01 sec)
Records: 8 Duplicates: 0 Warnings: 0

```

As a result, the four tables contain the following data:

```

mysql> SELECT * FROM test1;
+---+
| a1 |
+---+
| 1 |
| 3 |
| 1 |
| 7 |
| 1 |
| 8 |
| 4 |
| 4 |
+---+
8 rows in set (0.00 sec)

mysql> SELECT * FROM test2;
+---+
| a2 |
+---+
| 1 |
| 3 |
| 1 |
| 7 |
| 1 |
| 8 |
| 4 |
| 4 |
+---+
8 rows in set (0.00 sec)

mysql> SELECT * FROM test3;
+---+
| a3 |
+---+
| 2 |
| 5 |
| 6 |
| 9 |

```

```
| 10 |
+---+
5 rows in set (0.00 sec)

mysql> SELECT * FROM test4;
+---+-----+
| a4 | b4 |
+---+-----+
| 1 | 3 |
| 2 | 0 |
| 3 | 1 |
| 4 | 2 |
| 5 | 0 |
| 6 | 0 |
| 7 | 1 |
| 8 | 1 |
| 9 | 0 |
| 10 | 0 |
+---+-----+
10 rows in set (0.00 sec)
```

## 27.3.2 Trigger Metadata

To obtain metadata about triggers:

- Query the `TRIGGERS` table of the `INFORMATION_SCHEMA` database. See [Section 28.3.44, “The INFORMATION\\_SCHEMA TRIGGERS Table”](#).
- Use the `SHOW CREATE TRIGGER` statement. See [Section 15.7.7.12, “SHOW CREATE TRIGGER Statement”](#).
- Use the `SHOW TRIGGERS` statement. See [Section 15.7.7.40, “SHOW TRIGGERS Statement”](#).

## 27.4 Using the Event Scheduler

The *MySQL Event Scheduler* manages the scheduling and execution of events, that is, tasks that run according to a schedule. The following discussion covers the Event Scheduler and is divided into the following sections:

- [Section 27.4.1, “Event Scheduler Overview”](#), provides an introduction to and conceptual overview of MySQL Events.
- [Section 27.4.3, “Event Syntax”](#), discusses the SQL statements for creating, altering, and dropping MySQL Events.
- [Section 27.4.4, “Event Metadata”](#), shows how to obtain information about events and how this information is stored by the MySQL Server.
- [Section 27.4.6, “The Event Scheduler and MySQL Privileges”](#), discusses the privileges required to work with events and the ramifications that events have with regard to privileges when executing.

Stored routines require the `events` data dictionary table in the `mysql` system database. This table is created during the MySQL 8.4 installation procedure. If you are upgrading to MySQL 8.4 from an earlier version, be sure to perform the upgrade procedure to make sure that your system database is up to date. See [Chapter 3, Upgrading MySQL](#).

## Additional Resources

- There are some restrictions on the use of events; see [Section 27.8, “Restrictions on Stored Programs”](#).
- Binary logging for events takes place as described in [Section 27.7, “Stored Program Binary Logging”](#).
- You may also find the [MySQL User Forums](#) to be helpful.

## 27.4.1 Event Scheduler Overview

MySQL Events are tasks that run according to a schedule. Therefore, we sometimes refer to them as *scheduled events*. When you create an event, you are creating a named database object containing one or more SQL statements to be executed at one or more regular intervals, beginning and ending at a specific date and time. Conceptually, this is similar to the idea of the Unix `cron` (also known as a “cron job”) or the Windows Task Scheduler.

Scheduled tasks of this type are also sometimes known as “temporal triggers”, implying that these are objects that are triggered by the passage of time. While this is essentially correct, we prefer to use the term *events* to avoid confusion with triggers of the type discussed in [Section 27.3, “Using Triggers”](#). Events should more specifically not be confused with “temporary triggers”. Whereas a trigger is a database object whose statements are executed in response to a specific type of event that occurs on a given table, a (scheduled) event is an object whose statements are executed in response to the passage of a specified time interval.

While there is no provision in the SQL Standard for event scheduling, there are precedents in other database systems, and you may notice some similarities between these implementations and that found in the MySQL Server.

MySQL Events have the following major features and properties:

- In MySQL, an event is uniquely identified by its name and the schema to which it is assigned.
- An event performs a specific action according to a schedule. This action consists of an SQL statement, which can be a compound statement in a `BEGIN ... END` block if desired (see [Section 15.6, “Compound Statement Syntax”](#)). An event’s timing can be either *one-time* or *recurrent*. A one-time event executes one time only. A recurrent event repeats its action at a regular interval, and the schedule for a recurring event can be assigned a specific start day and time, end day and time, both, or neither. (By default, a recurring event’s schedule begins as soon as it is created, and continues indefinitely, until it is disabled or dropped.)

If a repeating event does not terminate within its scheduling interval, the result may be multiple instances of the event executing simultaneously. If this is undesirable, you should institute a mechanism to prevent simultaneous instances. For example, you could use the `GET_LOCK()` function, or row or table locking.

- Users can create, modify, and drop scheduled events using SQL statements intended for these purposes. Syntactically invalid event creation and modification statements fail with an appropriate error message. *A user may include statements in an event’s action which require privileges that the user does not actually have.* The event creation or modification statement succeeds but the event’s action fails. See [Section 27.4.6, “The Event Scheduler and MySQL Privileges”](#) for details.
- Many of the properties of an event can be set or modified using SQL statements. These properties include the event’s name, timing, persistence (that is, whether it is preserved following the expiration of its schedule), status (enabled or disabled), action to be performed, and the schema to which it is assigned. See [Section 15.1.3, “ALTER EVENT Statement”](#).

The default definer of an event is the user who created the event, unless the event has been altered, in which case the definer is the user who issued the last `ALTER EVENT` statement affecting that event. An event can be modified by any user having the `EVENT` privilege on the database for which the event is defined. See [Section 27.4.6, “The Event Scheduler and MySQL Privileges”](#).

- An event’s action statement may include most SQL statements permitted within stored routines. For restrictions, see [Section 27.8, “Restrictions on Stored Programs”](#).

## 27.4.2 Event Scheduler Configuration

Events are executed by a special *event scheduler thread*; when we refer to the Event Scheduler, we actually refer to this thread. When running, the event scheduler thread and its current state can be

seen by users having the `PROCESS` privilege in the output of `SHOW PROCESSLIST`, as shown in the discussion that follows.

The global `event_scheduler` system variable determines whether the Event Scheduler is enabled and running on the server. It has one of the following values, which affect event scheduling as described:

- `ON`: The Event Scheduler is started; the event scheduler thread runs and executes all scheduled events. `ON` is the default `event_scheduler` value.

When the Event Scheduler is `ON`, the event scheduler thread is listed in the output of `SHOW PROCESSLIST` as a daemon process, and its state is represented as shown here:

```
mysql> SHOW PROCESSLIST\G
***** 1. row *****
 Id: 1
 User: root
 Host: localhost
 db: NULL
Command: Query
 Time: 0
 State: NULL
 Info: show processlist
***** 2. row *****
 Id: 2
 User: event_scheduler
 Host: localhost
 db: NULL
Command: Daemon
 Time: 3
 State: Waiting for next activation
 Info: NULL
2 rows in set (0.00 sec)
```

Event scheduling can be stopped by setting the value of `event_scheduler` to `OFF`.

- `OFF`: The Event Scheduler is stopped. The event scheduler thread does not run, is not shown in the output of `SHOW PROCESSLIST`, and no scheduled events execute.

When the Event Scheduler is stopped (`event_scheduler` is `OFF`), it can be started by setting the value of `event_scheduler` to `ON`. (See next item.)

- `DISABLED`: This value renders the Event Scheduler nonoperational. When the Event Scheduler is `DISABLED`, the event scheduler thread does not run (and so does not appear in the output of `SHOW PROCESSLIST`). In addition, the Event Scheduler state cannot be changed at runtime.

If the Event Scheduler status has not been set to `DISABLED`, `event_scheduler` can be toggled between `ON` and `OFF` (using `SET`). It is also possible to use `0` for `OFF`, and `1` for `ON` when setting this variable. Thus, any of the following 4 statements can be used in the `mysql` client to turn on the Event Scheduler:

```
SET GLOBAL event_scheduler = ON;
SET @@GLOBAL.event_scheduler = ON;
SET GLOBAL event_scheduler = 1;
SET @@GLOBAL.event_scheduler = 1;
```

Similarly, any of these 4 statements can be used to turn off the Event Scheduler:

```
SET GLOBAL event_scheduler = OFF;
SET @@GLOBAL.event_scheduler = OFF;
SET GLOBAL event_scheduler = 0;
SET @@GLOBAL.event_scheduler = 0;
```

#### Note

If the Event Scheduler is enabled, enabling the `super_read_only` system variable prevents it from updating event “last executed” timestamps in the

`events` data dictionary table. This causes the Event Scheduler to stop the next time it tries to execute a scheduled event, after writing a message to the server error log. (In this situation the `event_scheduler` system variable does not change from `ON` to `OFF`. An implication is that this variable rejects the DBA *intent* that the Event Scheduler be enabled or disabled, where its actual status of started or stopped may be distinct.). If `super_read_only` is subsequently disabled after being enabled, the server automatically restarts the Event Scheduler as needed.

Although `ON` and `OFF` have numeric equivalents, the value displayed for `event_scheduler` by `SELECT` or `SHOW VARIABLES` is always one of `OFF`, `ON`, or `DISABLED`. `DISABLED` has no numeric equivalent. For this reason, `ON` and `OFF` are usually preferred over `1` and `0` when setting this variable.

Note that attempting to set `event_scheduler` without specifying it as a global variable causes an error:

```
mysql> SET @@event_scheduler = OFF;
ERROR 1229 (HY000): Variable 'event_scheduler' is a GLOBAL
variable and should be set with SET GLOBAL
```

### Important

It is possible to set the Event Scheduler to `DISABLED` only at server startup. If `event_scheduler` is `ON` or `OFF`, you cannot set it to `DISABLED` at runtime. Also, if the Event Scheduler is set to `DISABLED` at startup, you cannot change the value of `event_scheduler` at runtime.

To disable the event scheduler, use one of the following two methods:

- As a command-line option when starting the server:

```
--event-scheduler=DISABLED
```

- In the server configuration file (`my.cnf`, or `my.ini` on Windows systems), include the line where it can be read by the server (for example, in a `[mysqld]` section):

```
event_scheduler=DISABLED
```

To enable the Event Scheduler, restart the server without the `--event-scheduler=DISABLED` command-line option, or after removing or commenting out the line containing `event-scheduler=DISABLED` in the server configuration file, as appropriate. Alternatively, you can use `ON` (or `1`) or `OFF` (or `0`) in place of the `DISABLED` value when starting the server.

### Note

You can issue event-manipulation statements when `event_scheduler` is set to `DISABLED`. No warnings or errors are generated in such cases (provided that the statements are themselves valid). However, scheduled events cannot execute until this variable is set to `ON` (or `1`). Once this has been done, the event scheduler thread executes all events whose scheduling conditions are satisfied.

Starting the MySQL server with the `--skip-grant-tables` option causes `event_scheduler` to be set to `DISABLED`, overriding any other value set either on the command line or in the `my.cnf` or `my.ini` file (Bug #26807).

For SQL statements used to create, alter, and drop events, see [Section 27.4.3, “Event Syntax”](#).

MySQL provides an `EVENTS` table in the `INFORMATION_SCHEMA` database. This table can be queried to obtain information about scheduled events which have been defined on the server. See [Section 27.4.4, “Event Metadata”](#), and [Section 28.3.14, “The INFORMATION\\_SCHEMA EVENTS Table”](#), for more information.

For information regarding event scheduling and the MySQL privilege system, see [Section 27.4.6, “The Event Scheduler and MySQL Privileges”](#).

### 27.4.3 Event Syntax

MySQL provides several SQL statements for working with scheduled events:

- New events are defined using the `CREATE EVENT` statement. See [Section 15.1.13, “CREATE EVENT Statement”](#).
- The definition of an existing event can be changed by means of the `ALTER EVENT` statement. See [Section 15.1.3, “ALTER EVENT Statement”](#).
- When a scheduled event is no longer wanted or needed, it can be deleted from the server by its definer using the `DROP EVENT` statement. See [Section 15.1.25, “DROP EVENT Statement”](#). Whether an event persists past the end of its schedule also depends on its `ON COMPLETION` clause, if it has one. See [Section 15.1.13, “CREATE EVENT Statement”](#).

An event can be dropped by any user having the `EVENT` privilege for the database on which the event is defined. See [Section 27.4.6, “The Event Scheduler and MySQL Privileges”](#).

### 27.4.4 Event Metadata

To obtain metadata about events:

- Query the `EVENTS` table of the `INFORMATION_SCHEMA` database. See [Section 28.3.14, “The INFORMATION\\_SCHEMA EVENTS Table”](#).
- Use the `SHOW CREATE EVENT` statement. See [Section 15.7.7.8, “SHOW CREATE EVENT Statement”](#).
- Use the `SHOW EVENTS` statement. See [Section 15.7.7.19, “SHOW EVENTS Statement”](#).

#### Event Scheduler Time Representation

Each session in MySQL has a session time zone (STZ). This is the session `time_zone` value that is initialized from the server's global `time_zone` value when the session begins but may be changed during the session.

The session time zone that is current when a `CREATE EVENT` or `ALTER EVENT` statement executes is used to interpret times specified in the event definition. This becomes the event time zone (ETZ); that is, the time zone that is used for event scheduling and is in effect within the event as it executes.

For representation of event information in the data dictionary, the `execute_at`, `starts`, and `ends` times are converted to UTC and stored along with the event time zone. This enables event execution to proceed as defined regardless of any subsequent changes to the server time zone or daylight saving time effects. The `last_executed` time is also stored in UTC.

Event times can be obtained by selecting from the Information Schema `EVENTS` table or from `SHOW EVENTS`, but they are reported as ETZ or STZ values. The following table summarizes representation of event times.

Value	EVENTS Table	SHOW EVENTS
Execute at	ETZ	ETZ
Starts	ETZ	ETZ
Ends	ETZ	ETZ
Last executed	ETZ	n/a
Created	STZ	n/a
Last altered	STZ	n/a

## 27.4.5 Event Scheduler Status

The Event Scheduler writes information about event execution that terminates with an error or warning to the MySQL Server's error log. See [Section 27.4.6, “The Event Scheduler and MySQL Privileges”](#) for an example.

To obtain information about the state of the Event Scheduler for debugging and troubleshooting purposes, run `mysqladmin debug` (see [Section 6.5.2, “mysqladmin — A MySQL Server Administration Program”](#)); after running this command, the server's error log contains output relating to the Event Scheduler, similar to what is shown here:

```
Events status:
LLA = Last Locked At LUA = Last Unlocked At
WOC = Waiting On Condition DL = Data Locked

Event scheduler status:
State : INITIALIZED
Thread id : 0
LLA : n/a:0
LUA : n/a:0
WOC : NO
Workers : 0
Executed : 0
Data locked: NO

Event queue status:
Element count : 0
Data locked : NO
Attempting lock : NO
LLA : init_queue:95
LUA : init_queue:103
WOC : NO
Next activation : never
```

In statements that occur as part of events executed by the Event Scheduler, diagnostics messages (not only errors, but also warnings) are written to the error log, and, on Windows, to the application event log. For frequently executed events, it is possible for this to result in many logged messages. For example, for `SELECT ... INTO var_list` statements, if the query returns no rows, a warning with error code 1329 occurs ([No data](#)), and the variable values remain unchanged. If the query returns multiple rows, error 1172 occurs ([Result consisted of more than one row](#)). For either condition, you can avoid having the warnings be logged by declaring a condition handler; see [Section 15.6.7.2, “DECLARE ... HANDLER Statement”](#). For statements that may retrieve multiple rows, another strategy is to use `LIMIT 1` to limit the result set to a single row.

## 27.4.6 The Event Scheduler and MySQL Privileges

To enable or disable the execution of scheduled events, it is necessary to set the value of the global `event_scheduler` system variable. This requires privileges sufficient to set global system variables. See [Section 7.1.9.1, “System Variable Privileges”](#).

The `EVENT` privilege governs the creation, modification, and deletion of events. This privilege can be bestowed using `GRANT`. For example, this `GRANT` statement confers the `EVENT` privilege for the schema named `myschema` on the user `jon@ghidora`:

```
GRANT EVENT ON myschema.* TO jon@ghidora;
```

(We assume that this user account already exists, and that we wish for it to remain unchanged otherwise.)

To grant this same user the `EVENT` privilege on all schemas, use the following statement:

```
GRANT EVENT ON *.* TO jon@ghidora;
```

The `EVENT` privilege has global or schema-level scope. Therefore, trying to grant it on a single table results in an error as shown:

```
mysql> GRANT EVENT ON myschema.mytable TO jon@ghidora;
ERROR 1144 (42000): Illegal GRANT/REVOKE command; please
consult the manual to see which privileges can be used
```

It is important to understand that an event is executed with the privileges of its definer, and that it cannot perform any actions for which its definer does not have the requisite privileges. For example, suppose that `jon@ghidora` has the `EVENT` privilege for `myschema`. Suppose also that this user has the `SELECT` privilege for `myschema`, but no other privileges for this schema. It is possible for `jon@ghidora` to create a new event such as this one:

```
CREATE EVENT e_store_ts
 ON SCHEDULE
 EVERY 10 SECOND
 DO
 INSERT INTO myschema.mytable VALUES (UNIX_TIMESTAMP());
```

The user waits for a minute or so, and then performs a `SELECT * FROM mytable;` query, expecting to see several new rows in the table. Instead, the table is empty. Since the user does not have the `INSERT` privilege for the table in question, the event has no effect.

If you inspect the MySQL error log (`hostname.err`), you can see that the event is executing, but the action it is attempting to perform fails:

```
2013-09-24T12:41:31.261992Z 25 [ERROR] Event Scheduler:
[jon@ghidora][cookbook.e_store_ts] INSERT command denied to user
'jon'@'ghidora' for table 'mytable'
2013-09-24T12:41:31.262022Z 25 [Note] Event Scheduler:
[jon@ghidora].[myschema.e_store_ts] event execution failed.
2013-09-24T12:41:41.271796Z 26 [ERROR] Event Scheduler:
[jon@ghidora][cookbook.e_store_ts] INSERT command denied to user
'jon'@'ghidora' for table 'mytable'
2013-09-24T12:41:41.272761Z 26 [Note] Event Scheduler:
[jon@ghidora].[myschema.e_store_ts] event execution failed.
```

Since this user very likely does not have access to the error log, it is possible to verify whether the event's action statement is valid by executing it directly:

```
mysql> INSERT INTO myschema.mytable VALUES (UNIX_TIMESTAMP());
ERROR 1142 (42000): INSERT command denied to user
'jon'@'ghidora' for table 'mytable'
```

Inspection of the Information Schema `EVENTS` table shows that `e_store_ts` exists and is enabled, but its `LAST_EXECUTED` column is `NULL`:

```
mysql> SELECT * FROM INFORMATION_SCHEMA.EVENTS
 > WHERE EVENT_NAME='e_store_ts'
 > AND EVENT_SCHEMA='myschema'\G
***** 1. row *****
EVENT_CATALOG: NULL
EVENT_SCHEMA: myschema
EVENT_NAME: e_store_ts
DEFINER: jon@ghidora
EVENT_BODY: SQL
EVENT_DEFINITION: INSERT INTO myschema.mytable VALUES (UNIX_TIMESTAMP())
EVENT_TYPE: RECURRING
EXECUTE_AT: NULL
INTERVAL_VALUE: 5
INTERVAL_FIELD: SECOND
SQL_MODE: NULL
STARTS: 0000-00-00 00:00:00
ENDS: 0000-00-00 00:00:00
STATUS: ENABLED
ON_COMPLETION: NOT PRESERVE
CREATED: 2006-02-09 22:36:06
LAST_ALTERED: 2006-02-09 22:36:06
LAST_EXECUTED: NULL
EVENT_COMMENT:
1 row in set (0.00 sec)
```

To rescind the `EVENT` privilege, use the `REVOKE` statement. In this example, the `EVENT` privilege on the schema `myschema` is removed from the `jon@ghidora` user account:

```
REVOKE EVENT ON myschema.* FROM jon@ghidora;
```

### Important

Revoking the `EVENT` privilege from a user does not delete or disable any events that may have been created by that user.

An event is not migrated or dropped as a result of renaming or dropping the user who created it.

Suppose that the user `jon@ghidora` has been granted the `EVENT` and `INSERT` privileges on the `myschema` schema. This user then creates the following event:

```
CREATE EVENT e_insert
 ON SCHEDULE
 EVERY 7 SECOND
 DO
 INSERT INTO myschema.mytable;
```

After this event has been created, `root` revokes the `EVENT` privilege for `jon@ghidora`. However, `e_insert` continues to execute, inserting a new row into `mytable` each seven seconds. The same would be true if `root` had issued either of these statements:

- `DROP USER jon@ghidora;`
- `RENAME USER jon@ghidora TO someotherguy@ghidora;`

You can verify that this is true by examining the Information Schema `EVENTS` table before and after issuing a `DROP USER` or `RENAME USER` statement.

Event definitions are stored in the data dictionary. To drop an event created by another user account, you must be the MySQL `root` user or another user with the necessary privileges.

Users' `EVENT` privileges are stored in the `Event_priv` columns of the `mysql.user` and `mysql.db` tables. In both cases, this column holds one of the values '`Y`' or '`N`'. '`N`' is the default. `mysql.user.Event_priv` is set to '`Y`' for a given user only if that user has the global `EVENT` privilege (that is, if the privilege was bestowed using `GRANT EVENT ON *.*`). For a schema-level `EVENT` privilege, `GRANT` creates a row in `mysql.db` and sets that row's `Db` column to the name of the schema, the `User` column to the name of the user, and the `Event_priv` column to '`Y`'. There should never be any need to manipulate these tables directly, since the `GRANT EVENT` and `REVOKE EVENT` statements perform the required operations on them.

Five status variables provide counts of event-related operations (but *not* of statements executed by events; see [Section 27.8, “Restrictions on Stored Programs”](#)). These are:

- `Com_create_event`: The number of `CREATE EVENT` statements executed since the last server restart.
- `Com_alter_event`: The number of `ALTER EVENT` statements executed since the last server restart.
- `Com_drop_event`: The number of `DROP EVENT` statements executed since the last server restart.
- `Com_show_create_event`: The number of `SHOW CREATE EVENT` statements executed since the last server restart.
- `Com_show_events`: The number of `SHOW EVENTS` statements executed since the last server restart.

You can view current values for all of these at one time by running the statement `SHOW STATUS LIKE '%event%';`.

## 27.5 Using Views

MySQL supports views, including updatable views. Views are stored queries that when invoked produce a result set. A view acts as a virtual table.

The following discussion describes the syntax for creating and dropping views, and shows some examples of how to use them.

### Additional Resources

- You may find the [MySQL User Forums](#) helpful when working with views.
- For answers to some commonly asked questions regarding views in MySQL, see [Section A.6, “MySQL 8.4 FAQ: Views”](#).
- There are some restrictions on the use of views; see [Section 27.9, “Restrictions on Views”](#).

### 27.5.1 View Syntax

The `CREATE VIEW` statement creates a new view (see [Section 15.1.23, “CREATE VIEW Statement”](#)). To alter the definition of a view or drop a view, use `ALTER VIEW` (see [Section 15.1.11, “ALTER VIEW Statement”](#)), or `DROP VIEW` (see [Section 15.1.35, “DROP VIEW Statement”](#)).

A view can be created from many kinds of `SELECT` statements. It can refer to base tables or other views. It can use joins, `UNION`, and subqueries. The `SELECT` need not even refer to any tables. The following example defines a view that selects two columns from another table, as well as an expression calculated from those columns:

```
mysql> CREATE TABLE t (qty INT, price INT);
mysql> INSERT INTO t VALUES(3, 50), (5, 60);
mysql> CREATE VIEW v AS SELECT qty, price, qty*price AS value FROM t;
mysql> SELECT * FROM v;
+-----+-----+-----+
| qty | price | value |
+-----+-----+-----+
| 3 | 50 | 150 |
| 5 | 60 | 300 |
+-----+-----+-----+
mysql> SELECT * FROM v WHERE qty = 5;
+-----+-----+-----+
| qty | price | value |
+-----+-----+-----+
| 5 | 60 | 300 |
+-----+-----+-----+
```

### 27.5.2 View Processing Algorithms

The optional `ALGORITHM` clause for `CREATE VIEW` or `ALTER VIEW` is a MySQL extension to standard SQL. It affects how MySQL processes the view. `ALGORITHM` takes three values: `MERGE`, `TEMPTABLE`, or `UNDEFINED`.

- For `MERGE`, the text of a statement that refers to the view and the view definition are merged such that parts of the view definition replace corresponding parts of the statement.
- For `TEMPTABLE`, the results from the view are retrieved into a temporary table, which then is used to execute the statement.
- For `UNDEFINED`, MySQL chooses which algorithm to use. It prefers `MERGE` over `TEMPTABLE` if possible, because `MERGE` is usually more efficient and because a view cannot be updated if a temporary table is used.
- If no `ALGORITHM` clause is present, the default algorithm is determined by the value of the `derived_merge` flag of the `optimizer_switch` system variable. For additional discussion, see

[Section 10.2.2.4, “Optimizing Derived Tables, View References, and Common Table Expressions with Merging or Materialization”.](#)

A reason to specify `TEMPTABLE` explicitly is that locks can be released on underlying tables after the temporary table has been created and before it is used to finish processing the statement. This might result in quicker lock release than the `MERGE` algorithm so that other clients that use the view are not blocked as long.

A view algorithm can be `UNDEFINED` for three reasons:

- No `ALGORITHM` clause is present in the `CREATE VIEW` statement.
- The `CREATE VIEW` statement has an explicit `ALGORITHM = UNDEFINED` clause.
- `ALGORITHM = MERGE` is specified for a view that can be processed only with a temporary table. In this case, MySQL generates a warning and sets the algorithm to `UNDEFINED`.

As mentioned earlier, `MERGE` is handled by merging corresponding parts of a view definition into the statement that refers to the view. The following examples briefly illustrate how the `MERGE` algorithm works. The examples assume that there is a view `v_merge` that has this definition:

```
CREATE ALGORITHM = MERGE VIEW v_merge (vc1, vc2) AS
SELECT c1, c2 FROM t WHERE c3 > 100;
```

Example 1: Suppose that we issue this statement:

```
SELECT * FROM v_merge;
```

MySQL handles the statement as follows:

- `v_merge` becomes `t`
- `*` becomes `vc1, vc2`, which corresponds to `c1, c2`
- The view `WHERE` clause is added

The resulting statement to be executed becomes:

```
SELECT c1, c2 FROM t WHERE c3 > 100;
```

Example 2: Suppose that we issue this statement:

```
SELECT * FROM v_merge WHERE vc1 < 100;
```

This statement is handled similarly to the previous one, except that `vc1 < 100` becomes `c1 < 100` and the view `WHERE` clause is added to the statement `WHERE` clause using an `AND` connective (and parentheses are added to make sure the parts of the clause are executed with correct precedence). The resulting statement to be executed becomes:

```
SELECT c1, c2 FROM t WHERE (c3 > 100) AND (c1 < 100);
```

Effectively, the statement to be executed has a `WHERE` clause of this form:

```
WHERE (select WHERE) AND (view WHERE)
```

If the `MERGE` algorithm cannot be used, a temporary table must be used instead. Constructs that prevent merging are the same as those that prevent merging in derived tables and common table expressions. Examples are `SELECT DISTINCT` or `LIMIT` in the subquery. For details, see [Section 10.2.2.4, “Optimizing Derived Tables, View References, and Common Table Expressions with Merging or Materialization”](#).

### 27.5.3 Updatable and Insertable Views

Some views are updatable and references to them can be used to specify tables to be updated in data change statements. That is, you can use them in statements such as `UPDATE`, `DELETE`, or `INSERT` to update the contents of the underlying table. Derived tables and common table expressions can also be

specified in multiple-table `UPDATE` and `DELETE` statements, but can only be used for reading data to specify rows to be updated or deleted. Generally, the view references must be updatable, meaning that they may be merged and not materialized. Composite views have more complex rules.

For a view to be updatable, there must be a one-to-one relationship between the rows in the view and the rows in the underlying table. There are also certain other constructs that make a view nonupdatable. To be more specific, a view is not updatable if it contains any of the following:

- Aggregate functions or window functions (`SUM()`, `MIN()`, `MAX()`, `COUNT()`, and so forth)
- `DISTINCT`
- `GROUP BY`
- `HAVING`
- `UNION` or `UNION ALL`
- Subquery in the select list

Nondependent subqueries in the select list fail for `INSERT`, but are okay for `UPDATE`, `DELETE`. For dependent subqueries in the select list, no data change statements are permitted.

- Certain joins (see additional join discussion later in this section)
- Reference to nonupdatable view in the `FROM` clause
- Subquery in the `WHERE` clause that refers to a table in the `FROM` clause
- Refers only to literal values (in this case, there is no underlying table to update)
- `ALGORITHM = TEMPTABLE` (use of a temporary table always makes a view nonupdatable)
- Multiple references to any column of a base table (fails for `INSERT`, okay for `UPDATE`, `DELETE`)

A generated column in a view is considered updatable because it is possible to assign to it. However, if such a column is updated explicitly, the only permitted value is `DEFAULT`. For information about generated columns, see [Section 15.1.20.8, “CREATE TABLE and Generated Columns”](#).

It is sometimes possible for a multiple-table view to be updatable, assuming that it can be processed with the `MERGE` algorithm. For this to work, the view must use an inner join (not an outer join or a `UNION`). Also, only a single table in the view definition can be updated, so the `SET` clause must name only columns from one of the tables in the view. Views that use `UNION ALL` are not permitted even though they might be theoretically updatable.

With respect to insertability (being updatable with `INSERT` statements), an updatable view is insertable if it also satisfies these additional requirements for the view columns:

- There must be no duplicate view column names.
- The view must contain all columns in the base table that do not have a default value.
- The view columns must be simple column references. They must not be expressions, such as these:

```
3.14159
col1 + 3
UPPER(col2)
col3 / col4
(subquery)
```

MySQL sets a flag, called the view updatability flag, at `CREATE VIEW` time. The flag is set to `YES` (true) if `UPDATE` and `DELETE` (and similar operations) are legal for the view. Otherwise, the flag is set to `NO` (false). The `IS_UPDATABLE` column in the Information Schema `VIEWS` table displays the status of this flag. It means that the server always knows whether a view is updatable.

If a view is not updatable, statements such `UPDATE`, `DELETE`, and `INSERT` are illegal and are rejected. (Even if a view is updatable, it might not be possible to insert into it, as described elsewhere in this section.)

The updatability of views may be affected by the value of the `updatable_views_with_limit` system variable. See [Section 7.1.8, “Server System Variables”](#).

For the following discussion, suppose that these tables and views exist:

```
CREATE TABLE t1 (x INTEGER);
CREATE TABLE t2 (c INTEGER);
CREATE VIEW vmat AS SELECT SUM(x) AS s FROM t1;
CREATE VIEW vup AS SELECT * FROM t2;
CREATE VIEW vjoin AS SELECT * FROM vmat JOIN vup ON vmat.s=vup.c;
```

`INSERT`, `UPDATE`, and `DELETE` statements are permitted as follows:

- `INSERT`: The insert table of an `INSERT` statement may be a view reference that is merged. If the view is a join view, all components of the view must be updatable (not materialized). For a multiple-table updatable view, `INSERT` can work if it inserts into a single table.

This statement is invalid because one component of the join view is nonupdatable:

```
INSERT INTO vjoin (c) VALUES (1);
```

This statement is valid; the view contains no materialized components:

```
INSERT INTO vup (c) VALUES (1);
```

- `UPDATE`: The table or tables to be updated in an `UPDATE` statement may be view references that are merged. If a view is a join view, at least one component of the view must be updatable (this differs from `INSERT`).

In a multiple-table `UPDATE` statement, the updated table references of the statement must be base tables or updatable view references. Nonupdated table references may be materialized views or derived tables.

This statement is valid; column `c` is from the updatable part of the join view:

```
UPDATE vjoin SET c=c+1;
```

This statement is invalid; column `x` is from the nonupdatable part:

```
UPDATE vjoin SET x=x+1;
```

This statement is valid; the updated table reference of the multiple-table `UPDATE` is an updatable view (`vup`):

```
UPDATE vup JOIN (SELECT SUM(x) AS s FROM t1) AS dt ON ...
SET c=c+1;
```

This statement is invalid; it tries to update a materialized derived table:

```
UPDATE vup JOIN (SELECT SUM(x) AS s FROM t1) AS dt ON ...
SET s=s+1;
```

- `DELETE`: The table or tables to be deleted from in a `DELETE` statement must be merged views. Join views are not allowed (this differs from `INSERT` and `UPDATE`).

This statement is invalid because the view is a join view:

```
DELETE vjoin WHERE ...;
```

This statement is valid because the view is a merged (updatable) view:

```
DELETE vup WHERE ...;
```

This statement is valid because it deletes from a merged (updatable) view:

```
DELETE vup FROM vup JOIN (SELECT SUM(x) AS s FROM t1) AS dt ON ...;
```

Additional discussion and examples follow.

Earlier discussion in this section pointed out that a view is not insertable if not all columns are simple column references (for example, if it contains columns that are expressions or composite expressions). Although such a view is not insertable, it can be updatable if you update only columns that are not expressions. Consider this view:

```
CREATE VIEW v AS SELECT col1, 1 AS col2 FROM t;
```

This view is not insertable because `col2` is an expression. But it is updatable if the update does not try to update `col2`. This update is permissible:

```
UPDATE v SET col1 = 0;
```

This update is not permissible because it attempts to update an expression column:

```
UPDATE v SET col2 = 0;
```

If a table contains an `AUTO_INCREMENT` column, inserting into an insertable view on the table that does not include the `AUTO_INCREMENT` column does not change the value of `LAST_INSERT_ID()`, because the side effects of inserting default values into columns not part of the view should not be visible.

## 27.5.4 The View WITH CHECK OPTION Clause

The `WITH CHECK OPTION` clause can be given for an updatable view to prevent inserts to rows for which the `WHERE` clause in the `select_statement` is not true. It also prevents updates to rows for which the `WHERE` clause is true but the update would cause it to be not true (in other words, it prevents visible rows from being updated to nonvisible rows).

In a `WITH CHECK OPTION` clause for an updatable view, the `LOCAL` and `CASCDED` keywords determine the scope of check testing when the view is defined in terms of another view. When neither keyword is given, the default is `CASCDED`.

`WITH CHECK OPTION` testing is standard-compliant:

- With `LOCAL`, the view `WHERE` clause is checked, then checking recurses to underlying views and applies the same rules.
- With `CASCDED`, the view `WHERE` clause is checked, then checking recurses to underlying views, adds `WITH CASCDED CHECK OPTION` to them (for purposes of the check; their definitions remain unchanged), and applies the same rules.
- With no check option, the view `WHERE` clause is not checked, then checking recurses to underlying views, and applies the same rules.

Consider the definitions for the following table and set of views:

```
CREATE TABLE t1 (a INT);
CREATE VIEW v1 AS SELECT * FROM t1 WHERE a < 2
WITH CHECK OPTION;
CREATE VIEW v2 AS SELECT * FROM v1 WHERE a > 0
WITH LOCAL CHECK OPTION;
CREATE VIEW v3 AS SELECT * FROM v1 WHERE a > 0
WITH CASCDED CHECK OPTION;
```

Here the `v2` and `v3` views are defined in terms of another view, `v1`.

Inserts for `v2` are checked against its `LOCAL` check option, then the check recurses to `v1` and the rules are applied again. The rules for `v1` cause a check failure. The check for `v3` also fails:

```
mysql> INSERT INTO v2 VALUES (2);
ERROR 1369 (HY000): CHECK OPTION failed 'test.v2'
mysql> INSERT INTO v3 VALUES (2);
ERROR 1369 (HY000): CHECK OPTION failed 'test.v3'
```

## 27.5.5 View Metadata

To obtain metadata about views:

- Query the `VIEWS` table of the `INFORMATION_SCHEMA` database. See [Section 28.3.47, “The INFORMATION\\_SCHEMA VIEWS Table”](#).
- Use the `SHOW CREATE VIEW` statement. See [Section 15.7.7.14, “SHOW CREATE VIEW Statement”](#).

## 27.6 Stored Object Access Control

Stored programs (procedures, functions, triggers, and events) and views are defined prior to use and, when referenced, execute within a security context that determines their privileges. The privileges applicable to execution of a stored object are controlled by its `DEFINER` attribute and `SQL SECURITY` characteristic.

- [The DEFINER Attribute](#)
- [The SQL SECURITY Characteristic](#)
- [Examples](#)
- [Orphan Stored Objects](#)
- [Risk-Minimization Guidelines](#)

### The DEFINER Attribute

A stored object definition can include a `DEFINER` attribute that names a MySQL account. If a definition omits the `DEFINER` attribute, the default object definer is the user who creates it.

The following rules determine which accounts you can specify as the `DEFINER` attribute for a stored object:

- If you have the `SET_ANY_DEFINER` privilege, you can specify any account as the `DEFINER` attribute. If the account does not exist, a warning is generated. Additionally, to set a stored object `DEFINER` attribute to an account that has the `SYSTEM_USER` privilege, you must have the `SYSTEM_USER` privilege.
- Otherwise, the only permitted account is your own, specified either literally or as `CURRENT_USER` or `CURRENT_USER()`. You cannot set the definer to any other account.

Creating a stored object with a nonexistent `DEFINER` account creates an orphan object, which may have negative consequences; see [Orphan Stored Objects](#).

### The SQL SECURITY Characteristic

For stored routines (procedures and functions) and views, the object definition can include an `SQL SECURITY` characteristic with a value of `DEFINER` or `INVOKER` to specify whether the object executes in definer or invoker context. If the definition omits the `SQL SECURITY` characteristic, the default is definer context.

Triggers and events have no `SQL SECURITY` characteristic and always execute in definer context. The server invokes these objects automatically as necessary, so there is no invoking user.

Definer and invoker security contexts differ as follows:

- A stored object that executes in definer security context executes with the privileges of the account named by its `DEFINER` attribute. These privileges may be entirely different from those of the invoking user. The invoker must have appropriate privileges to reference the object (for example, `EXECUTE` to call a stored procedure or `SELECT` to select from a view), but during object execution, the invoker's privileges are ignored and only the `DEFINER` account privileges matter. If the `DEFINER` account has few privileges, the object is correspondingly limited in the operations it can perform. If the `DEFINER` account is highly privileged (such as an administrative account), the object can perform powerful operations *no matter who invokes it*.
- A stored routine or view that executes in invoker security context can perform only operations for which the invoker has privileges. The `DEFINER` attribute has no effect on object execution.

## Examples

Consider the following stored procedure, which is declared with `SQL SECURITY DEFINER` to execute in definer security context:

```
CREATE DEFINER = 'admin'@'localhost' PROCEDURE p1()
SQL SECURITY DEFINER
BEGIN
 UPDATE t1 SET counter = counter + 1;
END;
```

Any user who has the `EXECUTE` privilege for `p1` can invoke it with a `CALL` statement. However, when `p1` executes, it does so in definer security context and thus executes with the privileges of `'admin'@'localhost'`, the account named as its `DEFINER` attribute. This account must have the `EXECUTE` privilege for `p1` as well as the `UPDATE` privilege for the table `t1` referenced within the object body. Otherwise, the procedure fails.

Now consider this stored procedure, which is identical to `p1` except that its `SQL SECURITY` characteristic is `INVOKER`:

```
CREATE DEFINER = 'admin'@'localhost' PROCEDURE p2()
SQL SECURITY INVOKER
BEGIN
 UPDATE t1 SET counter = counter + 1;
END;
```

Unlike `p1`, `p2` executes in invoker security context and thus with the privileges of the invoking user regardless of the `DEFINER` attribute value. `p2` fails if the invoker lacks the `EXECUTE` privilege for `p2` or the `UPDATE` privilege for the table `t1`.

## Orphan Stored Objects

An orphan stored object is one for which its `DEFINER` attribute names a nonexistent account:

- An orphan stored object can be created by specifying a nonexistent `DEFINER` account at object-creation time.
- An existing stored object can become orphaned through execution of a `DROP USER` statement that drops the object `DEFINER` account, or a `RENAME USER` statement that renames the object `DEFINER` account.

An orphan stored object may be problematic in these ways:

- Because the `DEFINER` account does not exist, the object may not work as expected if it executes in definer security context:
  - For a stored routine, an error occurs at routine execution time if the `SQL SECURITY` value is `DEFINER` but the definer account does not exist.
  - For a trigger, it is not a good idea for trigger activation to occur until the account actually does exist. Otherwise, the behavior with respect to privilege checking is undefined.

- For an event, an error occurs at event execution time if the account does not exist.
- For a view, an error occurs when the view is referenced if the `SQL SECURITY` value is `DEFINER` but the definer account does not exist.
- The object may present a security risk if the nonexistent `DEFINER` account is subsequently re-created for a purpose unrelated to the object. In this case, the account “adopts” the object and, with the appropriate privileges, is able to execute it even if that is not intended.

The server imposes the following account-management security checks designed to prevent operations that (perhaps inadvertently) cause stored objects to become orphaned or that cause adoption of stored objects that are currently orphaned:

- `DROP USER` fails with an error if any account to be dropped is named as the `DEFINER` attribute for any stored object. (That is, the statement fails if dropping an account would cause a stored object to become orphaned.)
- `RENAME USER` fails with an error if any account to be renamed is named as the `DEFINER` attribute for any stored object. (That is, the statement fails if renaming an account would cause a stored object to become orphaned.)
- `CREATE USER` fails with an error if any account to be created is named as the `DEFINER` attribute for any stored object. (That is, the statement fails if creating an account would cause the account to adopt a currently orphaned stored object.)

In certain situations, it may be necessary to deliberately execute those account-management statements even when they would otherwise fail. To make this possible, if a user has the `ALLOW_NONEXISTENT_DEFINER` privilege, that privilege overrides the orphan object security checks and the statements succeed with a warning rather than failing with an error.

To obtain information about the accounts used as stored object definers in a MySQL installation, query the `INFORMATION_SCHEMA`.

This query identifies which `INFORMATION_SCHEMA` tables describe objects that have a `DEFINER` attribute:

```
mysql> SELECT TABLE_SCHEMA, TABLE_NAME FROM INFORMATION_SCHEMA.COLUMNS
 WHERE COLUMN_NAME = 'DEFINER';
+-----+-----+
| TABLE_SCHEMA | TABLE_NAME |
+-----+-----+
| information_schema | EVENTS |
| information_schema | ROUTINES |
| information_schema | TRIGGERS |
| information_schema | VIEWS |
+-----+-----+
```

The result tells you which tables to query to discover which stored object `DEFINER` values exist and which objects have a particular `DEFINER` value:

- To identify which `DEFINER` values exist in each table, use these queries:

```
SELECT DISTINCT DEFINER FROM INFORMATION_SCHEMA.EVENTS;
SELECT DISTINCT DEFINER FROM INFORMATION_SCHEMA.ROUTINES;
SELECT DISTINCT DEFINER FROM INFORMATION_SCHEMA.TRIGGERS;
SELECT DISTINCT DEFINER FROM INFORMATION_SCHEMA.VIEWS;
```

The query results are significant for any account displayed as follows:

- If the account exists, dropping or renaming it causes stored objects to become orphaned. If you plan to drop or rename the account, consider first dropping its associated stored objects or redefining them to have a different definer.

- If the account does not exist, creating it causes it to adopt currently orphaned stored objects. If you plan to create the account, consider whether the orphaned objects should be associated with it. If not, redefine them to have a different definer.

To redefine an object with a different definer, you can use `ALTER EVENT` or `ALTER VIEW` to directly modify the `DEFINER` account of events and views. For stored procedures and functions and for triggers, you must drop the object and re-create it to assign a different `DEFINER` account

- To identify which objects have a given `DEFINER` account, use these queries, substituting the account of interest for `user_name@host_name`:

```
SELECT EVENT_SCHEMA, EVENT_NAME FROM INFORMATION_SCHEMA.EVENTS
WHERE DEFINER = 'user_name@host_name';
SELECT ROUTINE_SCHEMA, ROUTINE_NAME, ROUTINE_TYPE
FROM INFORMATION_SCHEMA.ROUTINES
WHERE DEFINER = 'user_name@host_name';
SELECT TRIGGER_SCHEMA, TRIGGER_NAME FROM INFORMATION_SCHEMA.TRIGGERS
WHERE DEFINER = 'user_name@host_name';
SELECT TABLE_SCHEMA, TABLE_NAME FROM INFORMATION_SCHEMA.VIEWS
WHERE DEFINER = 'user_name@host_name';
```

For the `ROUTINES` table, the query includes the `ROUTINE_TYPE` column so that output rows distinguish whether the `DEFINER` is for a stored procedure or stored function.

If the account you are searching for does not exist, any objects displayed by those queries are orphan objects.

## Risk-Minimization Guidelines

To minimize the risk potential for stored object creation and use, follow these guidelines:

- Do not create orphan stored objects; that is, objects for which the `DEFINER` attribute names a nonexistent account. Do not cause stored objects to become orphaned by dropping or renaming an account named by the `DEFINER` attribute of any existing object.
- For a stored routine or view, use `SQL SECURITY INVOKER` in the object definition when possible so that it can be used only by users with permissions appropriate for the operations performed by the object.
- If you create definer-context stored objects while using an account that has the `SET ANY DEFINER` privilege, specify an explicit `DEFINER` attribute that names an account possessing only the privileges required for the operations performed by the object. Specify a highly privileged `DEFINER` account only when absolutely necessary.
- Administrators can prevent users from creating stored objects that specify highly privileged `DEFINER` accounts by not granting them the `SET ANY DEFINER` privilege.
- Definer-context objects should be written keeping in mind that they may be able to access data for which the invoking user has no privileges. In some cases, you can prevent references to these objects by not granting unauthorized users particular privileges:
  - A stored routine cannot be referenced by a user who does not have the `EXECUTE` privilege for it.
  - A view cannot be referenced by a user who does not have the appropriate privilege for it (`SELECT` to select from it, `INSERT` to insert into it, and so forth).

However, no such control exists for triggers and events because they always execute in definer context. The server invokes these objects automatically as necessary, and users do not reference them directly:

- A trigger is activated by access to the table with which it is associated, even ordinary table accesses by users with no special privileges.

- An event is executed by the server on a scheduled basis.

In both cases, if the `DEFINER` account is highly privileged, the object may be able to perform sensitive or dangerous operations. This remains true if the privileges needed to create the object are revoked from the account of the user who created it. Administrators should be especially careful about granting users object-creation privileges.

- By default, when a routine with the `SQL SECURITY DEFINER` characteristic is executed, MySQL Server does not set any active roles for the MySQL account named in the `DEFINER` clause, only the default roles. The exception is if the `activate_all_roles_on_login` system variable is enabled, in which case MySQL Server sets all roles granted to the `DEFINER` user, including mandatory roles. Any privileges granted through roles are therefore not checked by default when the `CREATE PROCEDURE` or `CREATE FUNCTION` statement is issued. For stored programs, if execution should occur with roles different from the default, the program body can execute `SET ROLE` to activate the required roles. This must be done with caution since the privileges assigned to roles can be changed.

## 27.7 Stored Program Binary Logging

The binary log contains information about SQL statements that modify database contents. This information is stored in the form of “events” that describe the modifications. (Binary log events differ from scheduled event stored objects.) The binary log has two important purposes:

- For replication, the binary log is used on source replication servers as a record of the statements to be sent to replica servers. The source sends the events contained in its binary log to its replicas, which execute those events to make the same data changes that were made on the source. See [Section 19.2, “Replication Implementation”](#).
- Certain data recovery operations require use of the binary log. After a backup file has been restored, the events in the binary log that were recorded after the backup was made are re-executed. These events bring databases up to date from the point of the backup. See [Section 9.3.2, “Using Backups for Recovery”](#).

However, if logging occurs at the statement level, there are certain binary logging issues with respect to stored programs (stored procedures and functions, triggers, and events):

- In some cases, a statement might affect different sets of rows on source and replica.
- Replicated statements executed on a replica are processed by the replica's applier thread. Unless you implement replication privilege checks (see [Section 19.3.3, “Replication Privilege Checks”](#)), the applier thread has full privileges. In this situation, it is possible for a procedure to follow different execution paths on source and replica servers, so a user could write a routine containing a dangerous statement that executes only on the replica.
- If a stored program that modifies data is nondeterministic, it is not repeatable. This can result in different data on source and replica, or cause restored data to differ from the original data.

This section describes how MySQL handles binary logging for stored programs. It states the current conditions that the implementation places on the use of stored programs, and what you can do to avoid logging problems. It also provides additional information about the reasons for these conditions.

Unless noted otherwise, the remarks here assume that binary logging is enabled on the server (see [Section 7.4.4, “The Binary Log”](#).) If the binary log is not enabled, replication is not possible, nor is the binary log available for data recovery. Binary logging is enabled by default, and is disabled only if you start the server with `--skip-log-bin` or `--disable-log-bin` at startup.

In general, the issues described here result when binary logging occurs at the SQL statement level (statement-based binary logging). If you use row-based binary logging, the log contains changes made to individual rows as a result of executing SQL statements. When routines or triggers execute, row changes are logged, not the statements that make the changes. For stored procedures, this means

that the `CALL` statement is not logged. For stored functions, row changes made within the function are logged, not the function invocation. For triggers, row changes made by the trigger are logged. On the replica side, only the row changes are seen, not the stored program invocation.

Mixed format binary logging (`binlog_format=MIXED`) uses statement-based binary logging, except for cases where only row-based binary logging is guaranteed to lead to proper results. With mixed format, when a stored function, stored procedure, trigger, event, or prepared statement contains anything that is not safe for statement-based binary logging, the entire statement is marked as unsafe and logged in row format. The statements used to create and drop procedures, functions, triggers, and events are always safe, and are logged in statement format. For more information about row-based, mixed, and statement-based logging, and how safe and unsafe statements are determined, see [Section 19.2.1, “Replication Formats”](#).

The conditions on the use of stored functions in MySQL can be summarized as follows. These conditions do not apply to stored procedures or Event Scheduler events and they do not apply unless binary logging is enabled.

- To create or alter a stored function, you must have the `SET_ANY_DEFINER` privilege, in addition to the `CREATE ROUTINE` or `ALTER ROUTINE` privilege that is normally required. (Depending on the `DEFINER` value in the function definition, `SET_ANY_DEFINER` might be required regardless of whether binary logging is enabled. See [Section 15.1.17, “CREATE PROCEDURE and CREATE FUNCTION Statements”](#).)
- When you create a stored function, you must declare either that it is deterministic or that it does not modify data. Otherwise, it may be unsafe for data recovery or replication.

By default, for a `CREATE FUNCTION` statement to be accepted, at least one of `DETERMINISTIC`, `NO SQL`, or `READS SQL DATA` must be specified explicitly. Otherwise an error occurs:

```
ERROR 1418 (HY000): This function has none of DETERMINISTIC, NO SQL,
or READS SQL DATA in its declaration and binary logging is enabled
(you *might* want to use the less safe log_bin_trust_function_creators
variable)
```

This function is deterministic (and does not modify data), so it is safe:

```
CREATE FUNCTION f1(i INT)
RETURNS INT
DETERMINISTIC
READS SQL DATA
BEGIN
 RETURN i;
END;
```

This function uses `UUID()`, which is not deterministic, so the function also is not deterministic and is not safe:

```
CREATE FUNCTION f2()
RETURNS CHAR(36) CHARACTER SET utf8mb4
BEGIN
 RETURN UUID();
END;
```

This function modifies data, so it may not be safe:

```
CREATE FUNCTION f3(p_id INT)
RETURNS INT
BEGIN
 UPDATE t SET modtime = NOW() WHERE id = p_id;
 RETURN ROW_COUNT();
END;
```

Assessment of the nature of a function is based on the “honesty” of the creator. MySQL does not check that a function declared `DETERMINISTIC` is free of statements that produce nondeterministic results.

- When you attempt to execute a stored function, if `binlog_format=STATEMENT` is set, the `DETERMINISTIC` keyword must be specified in the function definition. If this is not the case, an error is generated and the function does not run, unless `log_bin_trust_function_creators=1` is specified to override this check (see below). For recursive function calls, the `DETERMINISTIC` keyword is required on the outermost call only. If row-based or mixed binary logging is in use, the statement is accepted and replicated even if the function was defined without the `DETERMINISTIC` keyword.
- Because MySQL does not check if a function really is deterministic at creation time, the invocation of a stored function with the `DETERMINISTIC` keyword might carry out an action that is unsafe for statement-based logging, or invoke a function or procedure containing unsafe statements. If this occurs when `binlog_format=STATEMENT` is set, a warning message is issued. If row-based or mixed binary logging is in use, no warning is issued, and the statement is replicated in row-based format.
- To relax the preceding conditions on function creation (that you must have the `SUPER` privilege and that a function must be declared deterministic or to not modify data), set the global `log_bin_trust_function_creators` system variable to 1. By default, this variable has a value of 0, but you can change it like this:

```
mysql> SET GLOBAL log_bin_trust_function_creators = 1;
```

You can also set this variable at server startup.

If binary logging is not enabled, `log_bin_trust_function_creators` does not apply. `SUPER` is not required for function creation unless, as described previously, the `DEFINER` value in the function definition requires it.

- For information about built-in functions that may be unsafe for replication (and thus cause stored functions that use them to be unsafe as well), see [Section 19.5.1, “Replication Features and Issues”](#).

Triggers are similar to stored functions, so the preceding remarks regarding functions also apply to triggers with the following exception: `CREATE TRIGGER` does not have an optional `DETERMINISTIC` characteristic, so triggers are assumed to be always deterministic. However, this assumption might be invalid in some cases. For example, the `UUID()` function is nondeterministic (and does not replicate). Be careful about using such functions in triggers.

Triggers can update tables, so error messages similar to those for stored functions occur with `CREATE TRIGGER` if you do not have the required privileges. On the replica side, the replica uses the trigger `DEFINER` attribute to determine which user is considered to be the creator of the trigger.

The rest of this section provides additional detail about the logging implementation and its implications. You need not read it unless you are interested in the background on the rationale for the current logging-related conditions on stored routine use. This discussion applies only for statement-based logging, and not for row-based logging, with the exception of the first item: `CREATE` and `DROP` statements are logged as statements regardless of the logging mode.

- The server writes `CREATE EVENT`, `CREATE PROCEDURE`, `CREATE FUNCTION`, `ALTER EVENT`, `ALTER PROCEDURE`, `ALTER FUNCTION`, `DROP EVENT`, `DROP PROCEDURE`, and `DROP FUNCTION` statements to the binary log.
- A stored function invocation is logged as a `SELECT` statement if the function changes data and occurs within a statement that would not otherwise be logged. This prevents nonreplication of data changes that result from use of stored functions in nonlogged statements. For example, `SELECT` statements are not written to the binary log, but a `SELECT` might invoke a stored function that makes changes. To handle this, a `SELECT func_name()` statement is written to the binary log when the given function makes a change. Suppose that the following statements are executed on the source server:

```
CREATE FUNCTION f1(a INT) RETURNS INT
BEGIN
```

```

IF (a < 3) THEN
 INSERT INTO t2 VALUES (a);
END IF;
RETURN 0;
END;

CREATE TABLE t1 (a INT);
INSERT INTO t1 VALUES (1),(2),(3);

SELECT f1(a) FROM t1;

```

When the `SELECT` statement executes, the function `f1()` is invoked three times. Two of those invocations insert a row, and MySQL logs a `SELECT` statement for each of them. That is, MySQL writes the following statements to the binary log:

```

SELECT f1(1);
SELECT f1(2);

```

The server also logs a `SELECT` statement for a stored function invocation when the function invokes a stored procedure that causes an error. In this case, the server writes the `SELECT` statement to the log along with the expected error code. On the replica, if the same error occurs, that is the expected result and replication continues. Otherwise, replication stops.

- Logging stored function invocations rather than the statements executed by a function has a security implication for replication, which arises from two factors:
  - It is possible for a function to follow different execution paths on source and replica servers.
  - Statements executed on a replica are processed by the replica's applier thread. Unless you implement replication privilege checks (see [Section 19.3.3, “Replication Privilege Checks”](#)), the applier thread has full privileges.

The implication is that although a user must have the `CREATE ROUTINE` privilege to create a function, the user can write a function containing a dangerous statement that executes only on the replica where it is processed by a thread that has full privileges. For example, if the source and replica servers have server ID values of 1 and 2, respectively, a user on the source server could create and invoke an unsafe function `unsafe_func()` as follows:

```

mysql> delimiter //
mysql> CREATE FUNCTION unsafe_func () RETURNS INT
 -> BEGIN
 -> IF @@server_id=2 THEN dangerous_statement; END IF;
 -> RETURN 1;
 -> END;
 -> //
mysql> delimiter ;
mysql> INSERT INTO t VALUES(unsafe_func());

```

The `CREATE FUNCTION` and `INSERT` statements are written to the binary log, so the replica executes them. Because the replica's applier thread has full privileges, it executes the dangerous statement. Thus, the function invocation has different effects on the source and replica and is not replication-safe.

To guard against this danger for servers that have binary logging enabled, stored function creators must have the `SUPER` privilege, in addition to the usual `CREATE ROUTINE` privilege that is required. Similarly, to use `ALTER FUNCTION`, you must have the `SUPER` privilege in addition to the `ALTER ROUTINE` privilege. Without the `SUPER` privilege, an error occurs:

```

ERROR 1419 (HY000): You do not have the SUPER privilege and
binary logging is enabled (you *might* want to use the less safe
log_bin_trust_function_creators variable)

```

If you do not want to require function creators to have the `SUPER` privilege (for example, if all users with the `CREATE ROUTINE` privilege on your system are experienced application developers), set the global `log_bin_trust_function_creators` system variable to 1. You can also set this

variable at server startup. If binary logging is not enabled, `log_bin_trust_function_creators` does not apply. `SUPER` is not required for function creation unless, as described previously, the `DEFINER` value in the function definition requires it.

- The use of replication privilege checks recommended regardless of any choices you make about privileges for function creators. Replication privilege checks can be set up to ensure that only expected and relevant operations are authorized for the replication channel. For instructions to do this, see [Section 19.3.3, “Replication Privilege Checks”](#).
- If a function that performs updates is nondeterministic, it is not repeatable. This can have two undesirable effects:
  - It causes a replica to differ from the source.
  - Restored data does not match the original data.

To deal with these problems, MySQL enforces the following requirement: On a source server, creation and alteration of a function is refused unless you declare the function to be deterministic or to not modify data. Two sets of function characteristics apply here:

- The `DETERMINISTIC` and `NOT DETERMINISTIC` characteristics indicate whether a function always produces the same result for given inputs. The default is `NOT DETERMINISTIC` if neither characteristic is given. To declare that a function is deterministic, you must specify `DETERMINISTIC` explicitly.
- The `CONTAINS SQL`, `NO SQL`, `READS SQL DATA`, and `MODIFIES SQL DATA` characteristics provide information about whether the function reads or writes data. Either `NO SQL` or `READS SQL DATA` indicates that a function does not change data, but you must specify one of these explicitly because the default is `CONTAINS SQL` if no characteristic is given.

By default, for a `CREATE FUNCTION` statement to be accepted, at least one of `DETERMINISTIC`, `NO SQL`, or `READS SQL DATA` must be specified explicitly. Otherwise an error occurs:

```
ERROR 1418 (HY000): This function has none of DETERMINISTIC, NO SQL,
or READS SQL DATA in its declaration and binary logging is enabled
(you *might* want to use the less safe log_bin_trust_function_creators
variable)
```

If you set `log_bin_trust_function_creators` to 1, the requirement that functions be deterministic or not modify data is dropped.

- Stored procedure calls are logged at the statement level rather than at the `CALL` level. That is, the server does not log the `CALL` statement, it logs those statements within the procedure that actually execute. As a result, the same changes that occur on the source server also occur on replicas. This prevents problems that could result from a procedure having different execution paths on different machines.

In general, statements executed within a stored procedure are written to the binary log using the same rules that would apply were the statements to be executed in standalone fashion. Some special care is taken when logging procedure statements because statement execution within procedures is not quite the same as in nonprocedure context:

- A statement to be logged might contain references to local procedure variables. These variables do not exist outside of stored procedure context, so a statement that refers to such a variable cannot be logged literally. Instead, each reference to a local variable is replaced by this construct for logging purposes:

```
NAME_CONST(var_name, var_value)
```

`var_name` is the local variable name, and `var_value` is a constant indicating the value that the variable has at the time the statement is logged. `NAME_CONST()` has a value of `var_value`, and a “name” of `var_name`. Thus, if you invoke this function directly, you get a result like this:

```
mysql> SELECT NAME_CONST('myname', 14);
+-----+
| myname |
+-----+
| 14 |
+-----+
```

`NAME_CONST()` enables a logged standalone statement to be executed on a replica with the same effect as the original statement that was executed on the source within a stored procedure.

The use of `NAME_CONST()` can result in a problem for `CREATE TABLE ... SELECT` statements when the source column expressions refer to local variables. Converting these references to `NAME_CONST()` expressions can result in column names that are different on the source and replica servers, or names that are too long to be legal column identifiers. A workaround is to supply aliases for columns that refer to local variables. Consider this statement when `myvar` has a value of 1:

```
CREATE TABLE t1 SELECT myvar;
```

This is rewritten as follows:

```
CREATE TABLE t1 SELECT NAME_CONST(myvar, 1);
```

To ensure that the source and replica tables have the same column names, write the statement like this:

```
CREATE TABLE t1 SELECT myvar AS myvar;
```

The rewritten statement becomes:

```
CREATE TABLE t1 SELECT NAME_CONST(myvar, 1) AS myvar;
```

- A statement to be logged might contain references to user-defined variables. To handle this, MySQL writes a `SET` statement to the binary log to make sure that the variable exists on the replica with the same value as on the source. For example, if a statement refers to a variable `@my_var`, that statement is preceded in the binary log by the following statement, where `value` is the value of `@my_var` on the source:

```
SET @my_var = value;
```

- Procedure calls can occur within a committed or rolled-back transaction. Transactional context is accounted for so that the transactional aspects of procedure execution are replicated correctly. That is, the server logs those statements within the procedure that actually execute and modify data, and also logs `BEGIN`, `COMMIT`, and `ROLLBACK` statements as necessary. For example, if a procedure updates only transactional tables and is executed within a transaction that is rolled back, those updates are not logged. If the procedure occurs within a committed transaction, `BEGIN` and `COMMIT` statements are logged with the updates. For a procedure that executes within a rolled-back transaction, its statements are logged using the same rules that would apply if the statements were executed in standalone fashion:
  - Updates to transactional tables are not logged.
  - Updates to nontransactional tables are logged because rollback does not cancel them.
  - Updates to a mix of transactional and nontransactional tables are logged surrounded by `BEGIN` and `ROLLBACK` so that replicas make the same changes and rollbacks as on the source.
- A stored procedure call is *not* written to the binary log at the statement level if the procedure is invoked from within a stored function. In that case, the only thing logged is the statement that invokes the function (if it occurs within a statement that is logged) or a `DO` statement (if it occurs within a statement that is not logged). For this reason, care should be exercised in the use of stored functions that invoke a procedure, even if the procedure is otherwise safe in itself.

## 27.8 Restrictions on Stored Programs

- SQL Statements Not Permitted in Stored Routines
- Restrictions for Stored Functions
- Restrictions for Triggers
- Name Conflicts within Stored Routines
- Replication Considerations
- Debugging Considerations
- Unsupported Syntax from the SQL:2003 Standard
- Stored Routine Concurrency Considerations
- Event Scheduler Restrictions
- Stored routines and triggers in NDB Cluster

These restrictions apply to the features described in [Chapter 27, \*Stored Objects\*](#).

Some of the restrictions noted here apply to all stored routines; that is, both to stored procedures and stored functions. There are also some [restrictions specific to stored functions](#) but not to stored procedures.

The restrictions for stored functions also apply to triggers. There are also some [restrictions specific to triggers](#).

The restrictions for stored procedures also apply to the [DO](#) clause of Event Scheduler event definitions. There are also some [restrictions specific to events](#).

### SQL Statements Not Permitted in Stored Routines

Stored routines cannot contain arbitrary SQL statements. The following statements are not permitted:

- The locking statements `LOCK TABLES` and `UNLOCK TABLES`.
- `ALTER VIEW`.
- `LOAD DATA` and `LOAD XML`.
- SQL prepared statements (`PREPARE`, `EXECUTE`, `DEALLOCATE PREPARE`) can be used in stored procedures, but not in stored functions or triggers. Thus, stored functions and triggers cannot use dynamic SQL (where you construct statements as strings and then execute them).
- Generally, statements not permitted in SQL prepared statements are also not permitted in stored programs. For a list of statements supported as prepared statements, see [Section 15.5, “Prepared Statements”](#). Exceptions are `SIGNAL`, `RESIGNAL`, and `GET DIAGNOSTICS`, which are not permissible as prepared statements but are permitted in stored programs.
- Because local variables are in scope only during stored program execution, references to them are not permitted in prepared statements created within a stored program. Prepared statement scope is the current session, not the stored program, so the statement could be executed after the program ends, at which point the variables would no longer be in scope. For example, `SELECT ... INTO local_var` cannot be used as a prepared statement. This restriction also applies to stored procedure and function parameters. See [Section 15.5.1, “PREPARE Statement”](#).
- Within all stored programs (stored procedures and functions, triggers, and events), the parser treats `BEGIN [WORK]` as the beginning of a `BEGIN ... END` block.

To begin a transaction within a stored procedure or event, use `START TRANSACTION` instead.

`START TRANSACTION` cannot be used within a stored function or trigger.

## Restrictions for Stored Functions

The following additional statements or operations are not permitted within stored functions. They are permitted within stored procedures, except stored procedures that are invoked from within a stored function or trigger. For example, if you use `FLUSH` in a stored procedure, that stored procedure cannot be called from a stored function or trigger.

- Statements that perform explicit or implicit commit or rollback. Support for these statements is not required by the SQL standard, which states that each DBMS vendor may decide whether to permit them.
- Statements that return a result set. This includes `SELECT` statements that do not have an `INTO var_list` clause and other statements such as `SHOW`, `EXPLAIN`, and `CHECK TABLE`. A function can process a result set either with `SELECT ... INTO var_list` or by using a cursor and `FETCH` statements. See [Section 15.2.13.1, “SELECT ... INTO Statement”](#), and [Section 15.6.6, “Cursors”](#).
- `FLUSH` statements.
- Stored functions cannot be used recursively.
- A stored function or trigger cannot modify a table that is already being used (for reading or writing) by the statement that invoked the function or trigger.
- If you refer to a temporary table multiple times in a stored function under different aliases, a `Can't reopen table: 'tbl_name'` error occurs, even if the references occur in different statements within the function.
- `HANDLER ... READ` statements that invoke stored functions can cause replication errors and are disallowed.

## Restrictions for Triggers

For triggers, the following additional restrictions apply:

- Triggers are not activated by foreign key actions.
- When using row-based replication, triggers on the replica are not activated by statements originating on the source. The triggers on the replica are activated when using statement-based replication. For more information, see [Section 19.5.1.36, “Replication and Triggers”](#).
- The `RETURN` statement is not permitted in triggers, which cannot return a value. To exit a trigger immediately, use the `LEAVE` statement.
- Triggers are not permitted on tables in the `mysql` database. Nor are they permitted on `INFORMATION_SCHEMA` or `performance_schema` tables. Those tables are actually views and triggers are not permitted on views.
- The trigger cache does not detect when metadata of the underlying objects has changed. If a trigger uses a table and the table has changed since the trigger was loaded into the cache, the trigger operates using the outdated metadata.

## Name Conflicts within Stored Routines

The same identifier might be used for a routine parameter, a local variable, and a table column. Also, the same local variable name can be used in nested blocks. For example:

```
CREATE PROCEDURE p (i INT)
BEGIN
 DECLARE i INT DEFAULT 0;
 SELECT i FROM t;
```

```
BEGIN
 DECLARE i INT DEFAULT 1;
 SELECT i FROM t;
END;
END;
```

In such cases, the identifier is ambiguous and the following precedence rules apply:

- A local variable takes precedence over a routine parameter or table column.
- A routine parameter takes precedence over a table column.
- A local variable in an inner block takes precedence over a local variable in an outer block.

The behavior that variables take precedence over table columns is nonstandard.

## Replication Considerations

Use of stored routines can cause replication problems. This issue is discussed further in [Section 27.7, “Stored Program Binary Logging”](#).

The `--replicate-wild-do-table=db_name.tbl_name` option applies to tables, views, and triggers. It does not apply to stored procedures and functions, or events. To filter statements operating on the latter objects, use one or more of the `--replicate-*--db` options.

## Debugging Considerations

There are no stored routine debugging facilities.

## Unsupported Syntax from the SQL:2003 Standard

The MySQL stored routine syntax is based on the SQL:2003 standard. The following items from that standard are not currently supported:

- `UNDO` handlers
- `FOR` loops

## Stored Routine Concurrency Considerations

To prevent problems of interaction between sessions, when a client issues a statement, the server uses a snapshot of routines and triggers available for execution of the statement. That is, the server calculates a list of procedures, functions, and triggers that may be used during execution of the statement, loads them, and then proceeds to execute the statement. While the statement executes, it does not see changes to routines performed by other sessions.

For maximum concurrency, stored functions should minimize their side-effects; in particular, updating a table within a stored function can reduce concurrent operations on that table. A stored function acquires table locks before executing, to avoid inconsistency in the binary log due to mismatch of the order in which statements execute and when they appear in the log. When statement-based binary logging is used, statements that invoke a function are recorded rather than the statements executed within the function. Consequently, stored functions that update the same underlying tables do not execute in parallel. In contrast, stored procedures do not acquire table-level locks. All statements executed within stored procedures are written to the binary log, even for statement-based binary logging. See [Section 27.7, “Stored Program Binary Logging”](#).

## Event Scheduler Restrictions

The following limitations are specific to the Event Scheduler:

- Event names are handled in case-insensitive fashion. For example, you cannot have two events in the same database with the names `anEvent` and `AnEvent`.

- An event may not be created from within a stored program. An event may not be altered, or dropped from within a stored program, if the event name is specified by means of a variable. An event also may not create, alter, or drop stored routines or triggers.
- DDL statements on events are prohibited while a `LOCK TABLES` statement is in effect.
- Event timings using the intervals `YEAR`, `QUARTER`, `MONTH`, and `YEAR_MONTH` are resolved in months; those using any other interval are resolved in seconds. There is no way to cause events scheduled to occur at the same second to execute in a given order. In addition—due to rounding, the nature of threaded applications, and the fact that a nonzero length of time is required to create events and to signal their execution—events may be delayed by as much as 1 or 2 seconds. However, the time shown in the Information Schema `EVENTS` table's `LAST_EXECUTED` column is always accurate to within one second of the actual event execution time. (See also Bug #16522.)
- Each execution of the statements contained in the body of an event takes place in a new connection; thus, these statements have no effect in a given user session on the server's statement counts such as `Com_select` and `Com_insert` that are displayed by `SHOW STATUS`. However, such counts are updated in the global scope. (Bug #16422)
- Events do not support times later than the end of the Unix Epoch; this is approximately the beginning of the year 2038. Such dates are specifically not permitted by the Event Scheduler. (Bug #16396)
- References to stored functions, loadable functions, and tables in the `ON SCHEDULE` clauses of `CREATE EVENT` and `ALTER EVENT` statements are not supported. These sorts of references are not permitted. (See Bug #22830 for more information.)

## Stored routines and triggers in NDB Cluster

While stored procedures, stored functions, triggers, and scheduled events are all supported by tables using the `NDB` storage engine, you must keep in mind that these do *not* propagate automatically between MySQL Servers acting as Cluster SQL nodes. This is because stored routine and trigger definitions are stored in tables in the `mysql` system database using `InnoDB` tables, which are not copied between Cluster nodes.

Any stored routine or trigger that interacts with MySQL Cluster tables must be re-created by running the appropriate `CREATE PROCEDURE`, `CREATE FUNCTION`, or `CREATE TRIGGER` statements on each MySQL Server that participates in the cluster where you wish to use the stored routine or trigger. Similarly, any changes to existing stored routines or triggers must be carried out explicitly on all Cluster SQL nodes, using the appropriate `ALTER` or `DROP` statements on each MySQL Server accessing the cluster.

### Warning

Do *not* attempt to work around the issue just described by converting any `mysql` database tables to use the `NDB` storage engine. *Altering the system tables in the mysql database is not supported* and is very likely to produce undesirable results.

## 27.9 Restrictions on Views

The maximum number of tables that can be referenced in the definition of a view is 61.

View processing is not optimized:

- It is not possible to create an index on a view.
- Indexes can be used for views processed using the merge algorithm. However, a view that is processed with the temptable algorithm is unable to take advantage of indexes on its underlying tables (although indexes can be used during generation of the temporary tables).

There is a general principle that you cannot modify a table and select from the same table in a subquery. See [Section 15.2.15.12, “Restrictions on Subqueries”](#).

The same principle also applies if you select from a view that selects from the table, if the view selects from the table in a subquery and the view is evaluated using the merge algorithm. Example:

```
CREATE VIEW v1 AS
SELECT * FROM t2 WHERE EXISTS (SELECT 1 FROM t1 WHERE t1.a = t2.a);

UPDATE t1, v2 SET t1.a = 1 WHERE t1.b = v2.b;
```

If the view is evaluated using a temporary table, you *can* select from the table in the view subquery and still modify that table in the outer query. In this case, the view is stored in a temporary table and thus you are not really selecting from the table in a subquery and modifying it at the same time. (This is another reason you might wish to force MySQL to use the temptable algorithm by specifying `ALGORITHM = TEMPTABLE` in the view definition.)

You can use `DROP TABLE` or `ALTER TABLE` to drop or alter a table that is used in a view definition. No warning results from the `DROP` or `ALTER` operation, even though this invalidates the view. Instead, an error occurs later, when the view is used. `CHECK TABLE` can be used to check for views that have been invalidated by `DROP` or `ALTER` operations.

With regard to view updatability, the overall goal for views is that if any view is theoretically updatable, it should be updatable in practice. Many theoretically updatable views can be updated now, but limitations still exist. For details, see [Section 27.5.3, “Updatable and Insertable Views”](#).

There exists a shortcoming with the current implementation of views. If a user is granted the basic privileges necessary to create a view (the `CREATE VIEW` and `SELECT` privileges), that user cannot call `SHOW CREATE VIEW` on that object unless the user is also granted the `SHOW VIEW` privilege.

That shortcoming can lead to problems backing up a database with `mysqldump`, which may fail due to insufficient privileges. This problem is described in Bug #22062.

The workaround to the problem is for the administrator to manually grant the `SHOW VIEW` privilege to users who are granted `CREATE VIEW`, since MySQL doesn't grant it implicitly when views are created.

Views do not have indexes, so index hints do not apply. Use of index hints when selecting from a view is not permitted.

`SHOW CREATE VIEW` displays view definitions using an `AS alias_name` clause for each column. If a column is created from an expression, the default alias is the expression text, which can be quite long. Aliases for column names in `CREATE VIEW` statements are checked against the maximum column length of 64 characters (not the maximum alias length of 256 characters). As a result, views created from the output of `SHOW CREATE VIEW` fail if any column alias exceeds 64 characters. This can cause problems in the following circumstances for views with too-long aliases:

- View definitions fail to replicate to newer replicas that enforce the column-length restriction.
- Dump files created with `mysqldump` cannot be loaded into servers that enforce the column-length restriction.

A workaround for either problem is to modify each problematic view definition to use aliases that provide shorter column names. Then the view replicates properly, and can be dumped and reloaded without causing an error. To modify the definition, drop and create the view again with `DROP VIEW` and `CREATE VIEW`, or replace the definition with `CREATE OR REPLACE VIEW`.

For problems that occur when reloading view definitions in dump files, another workaround is to edit the dump file to modify its `CREATE VIEW` statements. However, this does not change the original view definitions, which may cause problems for subsequent dump operations.

---

[INFORMATION\\_SCHEMA](#) provides access to database *metadata*, information about the MySQL server such as the name of a database or table, the data type of a column, or access privileges. Other terms that are sometimes used for this information are *data dictionary* and *system catalog*.

## 28.1 Introduction

[INFORMATION\\_SCHEMA](#) provides access to database *metadata*, information about the MySQL server such as the name of a database or table, the data type of a column, or access privileges. Other terms that are sometimes used for this information are *data dictionary* and *system catalog*.

- [INFORMATION\\_SCHEMA Usage Notes](#)
- [Character Set Considerations](#)
- [INFORMATION\\_SCHEMA as Alternative to SHOW Statements](#)
- [INFORMATION\\_SCHEMA and Privileges](#)
- [Performance Considerations](#)
- [Standards Considerations](#)
- [Conventions in the INFORMATION\\_SCHEMA Reference Sections](#)
- [Related Information](#)

## INFORMATION\_SCHEMA Usage Notes

[INFORMATION\\_SCHEMA](#) is a database within each MySQL instance, the place that stores information about all the other databases that the MySQL server maintains. The [INFORMATION\\_SCHEMA](#) database contains several read-only tables. They are actually views, not base tables, so there are no files associated with them, and you cannot set triggers on them. Also, there is no database directory with that name.

Although you can select [INFORMATION\\_SCHEMA](#) as the default database with a [USE](#) statement, you can only read the contents of tables, not perform [INSERT](#), [UPDATE](#), or [DELETE](#) operations on them.

Here is an example of a statement that retrieves information from [INFORMATION\\_SCHEMA](#):

```
mysql> SELECT table_name, table_type, engine
 FROM information_schema.tables
 WHERE table_schema = 'db5'
 ORDER BY table_name;
+-----+-----+-----+
| table_name | table_type | engine |
+-----+-----+-----+
| fk | BASE TABLE | InnoDB |
| fk2 | BASE TABLE | InnoDB |
| goto | BASE TABLE | MyISAM |
| into | BASE TABLE | MyISAM |
| k | BASE TABLE | MyISAM |
| kurs | BASE TABLE | MyISAM |
| loop | BASE TABLE | MyISAM |
| pk | BASE TABLE | InnoDB |
| t | BASE TABLE | MyISAM |
| t2 | BASE TABLE | MyISAM |
| t3 | BASE TABLE | MyISAM |
| t7 | BASE TABLE | MyISAM |
| tables | BASE TABLE | MyISAM |
| v | VIEW | NULL |
| v2 | VIEW | NULL |
| v3 | VIEW | NULL |
| v56 | VIEW | NULL |
+-----+-----+-----+
17 rows in set (0.01 sec)
```

Explanation: The statement requests a list of all the tables in database [db5](#), showing just three pieces of information: the name of the table, its type, and its storage engine.

Information about generated invisible primary keys is visible by default in all [INFORMATION\\_SCHEMA](#) tables describing table columns, keys, or both, such as the [COLUMNS](#) and [STATISTICS](#) tables. If you wish to make such information hidden from queries that select from these tables, you can do so by setting the value of the [show\\_gipk\\_in\\_create\\_table\\_and\\_information\\_schema](#) server system variable to [OFF](#). For more information, see [Section 15.1.20.11, “Generated Invisible Primary Keys”](#).

## Character Set Considerations

The definition for character columns (for example, `TABLES . TABLE_NAME`) is generally `VARCHAR(N) CHARACTER SET utf8mb3` where `N` is at least 64. MySQL uses the default collation for this character set (`utf8mb3_general_ci`) for all searches, sorts, comparisons, and other string operations on such columns.

Because some MySQL objects are represented as files, searches in `INFORMATION_SCHEMA` string columns can be affected by file system case sensitivity. For more information, see [Section 12.8.7, “Using Collation in INFORMATION\\_SCHEMA Searches”](#).

## INFORMATION\_SCHEMA as Alternative to SHOW Statements

The `SELECT ... FROM INFORMATION_SCHEMA` statement is intended as a more consistent way to provide access to the information provided by the various `SHOW` statements that MySQL supports (`SHOW DATABASES`, `SHOW TABLES`, and so forth). Using `SELECT` has these advantages, compared to `SHOW`:

- It conforms to Codd's rules, because all access is done on tables.
- You can use the familiar syntax of the `SELECT` statement, and only need to learn some table and column names.
- The implementor need not worry about adding keywords.
- You can filter, sort, concatenate, and transform the results from `INFORMATION_SCHEMA` queries into whatever format your application needs, such as a data structure or a text representation to parse.
- This technique is more interoperable with other database systems. For example, Oracle Database users are familiar with querying tables in the Oracle data dictionary.

Because `SHOW` is familiar and widely used, the `SHOW` statements remain as an alternative. In fact, along with the implementation of `INFORMATION_SCHEMA`, there are enhancements to `SHOW` as described in [Section 28.8, “Extensions to SHOW Statements”](#).

## INFORMATION\_SCHEMA and Privileges

For most `INFORMATION_SCHEMA` tables, each MySQL user has the right to access them, but can see only the rows in the tables that correspond to objects for which the user has the proper access privileges. In some cases (for example, the `ROUTINE_DEFINITION` column in the `INFORMATION_SCHEMA ROUTINES` table), users who have insufficient privileges see `NULL`. Some tables have different privilege requirements; for these, the requirements are mentioned in the applicable table descriptions. For example, `InnoDB` tables (tables with names that begin with `INNODB_`) require the `PROCESS` privilege.

The same privileges apply to selecting information from `INFORMATION_SCHEMA` and viewing the same information through `SHOW` statements. In either case, you must have some privilege on an object to see information about it.

## Performance Considerations

`INFORMATION_SCHEMA` queries that search for information from more than one database might take a long time and impact performance. To check the efficiency of a query, you can use `EXPLAIN`. For information about using `EXPLAIN` output to tune `INFORMATION_SCHEMA` queries, see [Section 10.2.3, “Optimizing INFORMATION\\_SCHEMA Queries”](#).

## Standards Considerations

The implementation for the `INFORMATION_SCHEMA` table structures in MySQL follows the ANSI/ISO SQL:2003 standard Part 11 *Schemata*. Our intent is approximate compliance with SQL:2003 core feature F021 *Basic information schema*.

Users of SQL Server 2000 (which also follows the standard) may notice a strong similarity. However, MySQL has omitted many columns that are not relevant for our implementation, and added columns that are MySQL-specific. One such added column is the `ENGINE` column in the `INFORMATION_SCHEMA TABLES` table.

Although other DBMSs use a variety of names, like `syscat` or `system`, the standard name is `INFORMATION_SCHEMA`.

To avoid using any name that is reserved in the standard or in DB2, SQL Server, or Oracle, we changed the names of some columns marked “MySQL extension”. (For example, we changed `COLLATION` to `TABLE_COLLATION` in the `TABLES` table.) See the list of reserved words near the end of this article: <https://web.archive.org/web/20070428032454/http://www.dbazine.com/db2/db2-disarticles/gulutzan5>.

## Conventions in the INFORMATION\_SCHEMA Reference Sections

The following sections describe each of the tables and columns in `INFORMATION_SCHEMA`. For each column, there are three pieces of information:

- “`INFORMATION_SCHEMA Name`” indicates the name for the column in the `INFORMATION_SCHEMA` table. This corresponds to the standard SQL name unless the “Remarks” field says “MySQL extension.”
- “`SHOW Name`” indicates the equivalent field name in the closest `SHOW` statement, if there is one.
- “Remarks” provides additional information where applicable. If this field is `NULL`, it means that the value of the column is always `NULL`. If this field says “MySQL extension,” the column is a MySQL extension to standard SQL.

Many sections indicate what `SHOW` statement is equivalent to a `SELECT` that retrieves information from `INFORMATION_SCHEMA`. For `SHOW` statements that display information for the default database if you omit a `FROM db_name` clause, you can often select information for the default database by adding an `AND TABLE_SCHEMA = SCHEMA()` condition to the `WHERE` clause of a query that retrieves information from an `INFORMATION_SCHEMA` table.

## Related Information

These sections discuss additional `INFORMATION_SCHEMA`-related topics:

- information about `INFORMATION_SCHEMA` tables specific to the `InnoDB` storage engine: [Section 28.4, “INFORMATION\\_SCHEMA InnoDB Tables”](#)
- information about `INFORMATION_SCHEMA` tables specific to the thread pool plugin: [Section 28.5, “INFORMATION\\_SCHEMA Thread Pool Tables”](#)
- information about `INFORMATION_SCHEMA` tables specific to the `CONNECTION_CONTROL` plugin: [Section 28.6, “INFORMATION\\_SCHEMA Connection Control Tables”](#)
- Answers to questions that are often asked concerning the `INFORMATION_SCHEMA` database: [Section A.7, “MySQL 8.4 FAQ: INFORMATION\\_SCHEMA”](#)
- `INFORMATION_SCHEMA` queries and the optimizer: [Section 10.2.3, “Optimizing INFORMATION\\_SCHEMA Queries”](#)
- The effect of collation on `INFORMATION_SCHEMA` comparisons: [Section 12.8.7, “Using Collation in INFORMATION\\_SCHEMA Searches”](#)

## 28.2 INFORMATION\_SCHEMA Table Reference

The following table summarizes all available `INFORMATION_SCHEMA` tables. For greater detail, see the individual table descriptions.

**Table 28.1 INFORMATION\_SCHEMA Tables**

<b>Table Name</b>	<b>Description</b>	<b>Deprecated</b>
ADMINISTRABLE_ROLE_AUTHORITIES	Grantable users or roles for current user or role	
APPLICABLE_ROLES	Applicable roles for current user	
CHARACTER_SETS	Available character sets	
CHECK_CONSTRAINTS	Table and column CHECK constraints	
COLLATION_CHARACTER_SET_APPLICABILITY	Character set applicable to each collation	
COLLATIONS	Collations for each character set	
COLUMN_PRIVILEGES	Privileges defined on columns	
COLUMN_STATISTICS	Histogram statistics for column values	
COLUMNS	Columns in each table	
COLUMNS_EXTENSIONS	Column attributes for primary and secondary storage engines	
CONNECTION_CONTROL_FAILED_ATTEMPTS	Current number of consecutive failed connection attempts per account	
ENABLED_ROLES	Roles enabled within current session	
ENGINES	Storage engine properties	
EVENTS	Event Manager events	
FILES	Files that store tablespace data	
INNODB_BUFFER_PAGE	Pages in InnoDB buffer pool	
INNODB_BUFFER_PAGE_LRU	LRU ordering of pages in InnoDB buffer pool	
INNODB_BUFFER_POOL_STATS	InnoDB buffer pool statistics	
INNODB_CACHED_INDEXES	Number of index pages cached per index in InnoDB buffer pool	
INNODB_CMP	Status for operations related to compressed InnoDB tables	
INNODB_CMP_PER_INDEX	Status for operations related to compressed InnoDB tables and indexes	
INNODB_CMP_PER_INDEX_RESET	Status for operations related to compressed InnoDB tables and indexes	
INNODB_CMP_RESET	Status for operations related to compressed InnoDB tables	
INNODB_CMPMEM	Status for compressed pages within InnoDB buffer pool	
INNODB_CMPMEM_RESET	Status for compressed pages within InnoDB buffer pool	
INNODB_COLUMNS	Columns in each InnoDB table	

Table Name	Description	Deprecated
INNODB_DATAFILES	Data file path information for InnoDB file-per-table and general tablespaces	
INNODB_FIELDS	Key columns of InnoDB indexes	
INNODB_FOREIGN	InnoDB foreign-key metadata	
INNODB_FOREIGN_COLS	InnoDB foreign-key column status information	
INNODB_FT_BEING_DELETED	Snapshot of INNODB_FT_DELETED table	
INNODB_FT_CONFIG	Metadata for InnoDB table FULLTEXT index and associated processing	
INNODB_FT_DEFAULT_STOPWORD	Default list of stopwords for InnoDB FULLTEXT indexes	
INNODB_FT_DELETED	Rows deleted from InnoDB table FULLTEXT index	
INNODB_FT_INDEX_CACHE	Token information for newly inserted rows in InnoDB FULLTEXT index	
INNODB_FT_INDEX_TABLE	Inverted index information for processing text searches against InnoDB table FULLTEXT index	
INNODB_INDEXES	InnoDB index metadata	
INNODB_METRICS	InnoDB performance information	
INNODB_SESSION_TEMP_TABLES	Session temporary-tablespace metadata	
INNODB_TABLES	InnoDB table metadata	
INNODB_TABLESPACES	InnoDB file-per-table, general, and undo tablespace metadata	
INNODB_TABLESPACES_BRIEF	Brief file-per-table, general, undo, and system tablespace metadata	
INNODB_TABLESTATS	InnoDB table low-level status information	
INNODB_TEMP_TABLE_INFO	Information about active user-created InnoDB temporary tables	
INNODB_TRX	Active InnoDB transaction information	
INNODB_VIRTUAL	InnoDB virtual generated column metadata	
KEY_COLUMN_USAGE	Which key columns have constraints	
KEYWORDS	MySQL keywords	
MYSQL_FIREWALL_USERS	Firewall in-memory data for account profiles	Yes
MYSQL_FIREWALL_WHITELIST	Firewall in-memory data for account profile allowlists	Yes

INFORMATION\_SCHEMA Table Reference

Table Name	Description	Deprecated
ndb_transid_mysql_connect	NDB transaction information	
OPTIMIZER_TRACE	Information produced by optimizer trace activity	
PARAMETERS	Stored routine parameters and stored function return values	
PARTITIONS	Table partition information	
PLUGINS	Plugin information	
PROCESSLIST	Information about currently executing threads	
PROFILING	Statement profiling information

## 28.3 INFORMATION\_SCHEMA General Tables

The following sections describe what may be denoted as the “general” set of [INFORMATION\\_SCHEMA](#) tables. These are the tables not associated with particular storage engines, components, or plugins.

### 28.3.1 INFORMATION\_SCHEMA General Table Reference

The following table summarizes [INFORMATION\\_SCHEMA](#) general tables. For greater detail, see the individual table descriptions.

**Table 28.2 INFORMATION\_SCHEMA General Tables**

Table Name	Description
ADMINISTRABLE_ROLE_AUTHORIZATIONS	Grantable users or roles for current user or role
APPLICABLE_ROLES	Applicable roles for current user
CHARACTER_SETS	Available character sets
CHECK_CONSTRAINTS	Table and column CHECK constraints
COLLATION_CHARACTER_SET_APPLICABILITY	Character set applicable to each collation
COLLATIONS	Collations for each character set
COLUMN_PRIVILEGES	Privileges defined on columns
COLUMN_STATISTICS	Histogram statistics for column values
COLUMNS	Columns in each table
COLUMNS_EXTENSIONS	Column attributes for primary and secondary storage engines
ENABLED_ROLES	Roles enabled within current session
ENGINES	Storage engine properties
EVENTS	Event Manager events
FILES	Files that store tablespace data
KEY_COLUMN_USAGE	Which key columns have constraints
KEYWORDS	MySQL keywords
ndb_transid_mysql_connection_map	NDB transaction information
OPTIMIZER_TRACE	Information produced by optimizer trace activity
PARAMETERS	Stored routine parameters and stored function return values
PARTITIONS	Table partition information
PLUGINS	Plugin information
PROCESSLIST	Information about currently executing threads

## The INFORMATION\_SCHEMA ADMINISTRABLE\_ROLE\_AUTHORIZATIONS Table

---

Table Name	Description
PROFILING	Statement profiling information
REFERENTIAL_CONSTRAINTS	Foreign key information
RESOURCE_GROUPS	Resource group information
ROLE_COLUMN_GRANTS	Column privileges for roles available to or granted by currently enabled roles
ROLE_ROUTINE_GRANTS	Routine privileges for roles available to or granted by currently enabled roles
ROLE_TABLE_GRANTS	Table privileges for roles available to or granted by currently enabled roles
ROUTINES	Stored routine information
SCHEMA_PRIVILEGES	Privileges defined on schemas
SCHEMATA	Schema information
SCHEMATA_EXTENSIONS	Schema options
ST_GEOMETRY_COLUMNS	Columns in each table that store spatial data
ST_SPATIAL_REFERENCE_SYSTEMS	Available spatial reference systems
ST_UNITS_OF_MEASURE	Acceptable units for ST_Distance()
STATISTICS	Table index statistics
TABLE_CONSTRAINTS	Which tables have constraints
TABLE_CONSTRAINTS_EXTENSIONS	Table constraint attributes for primary and secondary storage engines
TABLE_PRIVILEGES	Privileges defined on tables
TABLES	Table information
TABLES_EXTENSIONS	Table attributes for primary and secondary storage engines
TABLESPACES_EXTENSIONS	Tablespace attributes for primary storage engines
TRIGGERS	Trigger information
USER_ATTRIBUTES	User comments and attributes
USER_PRIVILEGES	Privileges defined globally per user
VIEW_ROUTINE_USAGE	Stored functions used in views
VIEW_TABLE_USAGE	Tables and views used in views
VIEWS	View information

### 28.3.2 The INFORMATION\_SCHEMA ADMINISTRABLE\_ROLE\_AUTHORIZATIONS Table

The [ADMINISTRABLE\\_ROLE\\_AUTHORIZATIONS](#) table provides information about which roles applicable for the current user or role can be granted to other users or roles.

The [ADMINISTRABLE\\_ROLE\\_AUTHORIZATIONS](#) table has these columns:

- [USER](#)

The user name part of the current user account.

- [HOST](#)

The host name part of the current user account.

- **GRANTEE**

The user name part of the account to which the role is granted.

- **GRANTEE\_HOST**

The host name part of the account to which the role is granted.

- **ROLE\_NAME**

The user name part of the granted role.

- **ROLE\_HOST**

The host name part of the granted role.

- **IS\_GRANTABLE**

YES or NO, depending on whether the role is grantable to other accounts.

- **IS\_DEFAULT**

YES or NO, depending on whether the role is a default role.

- **IS\_MANDATORY**

YES or NO, depending on whether the role is mandatory.

### 28.3.3 The INFORMATION\_SCHEMA APPLICABLE\_ROLES Table

The **APPLICABLE\_ROLES** table provides information about the roles that are applicable for the current user.

The **APPLICABLE\_ROLES** table has these columns:

- **USER**

The user name part of the current user account.

- **HOST**

The host name part of the current user account.

- **GRANTEE**

The user name part of the account to which the role is granted.

- **GRANTEE\_HOST**

The host name part of the account to which the role is granted.

- **ROLE\_NAME**

The user name part of the granted role.

- **ROLE\_HOST**

The host name part of the granted role.

- **IS\_GRANTABLE**

YES or NO, depending on whether the role is grantable to other accounts.

- **IS\_DEFAULT**

YES or NO, depending on whether the role is a default role.

- IS\_MANDATORY

YES or NO, depending on whether the role is mandatory.

## 28.3.4 The INFORMATION\_SCHEMA CHARACTER\_SETS Table

The CHARACTER\_SETS table provides information about available character sets.

The CHARACTER\_SETS table has these columns:

- CHARACTER\_SET\_NAME

The character set name.

- DEFAULT\_COLLATE\_NAME

The default collation for the character set.

- DESCRIPTION

A description of the character set.

- MAXLEN

The maximum number of bytes required to store one character.

### Notes

Character set information is also available from the SHOW CHARACTER SET statement. See Section 15.7.7.4, “SHOW CHARACTER SET Statement”. The following statements are equivalent:

```
SELECT * FROM INFORMATION_SCHEMA.CHARACTER_SETS
[WHERE CHARACTER_SET_NAME LIKE 'wild']

SHOW CHARACTER SET
[LIKE 'wild']
```

## 28.3.5 The INFORMATION\_SCHEMA CHECK\_CONSTRAINTS Table

CREATE TABLE supports the core features of table and column CHECK constraints; the CHECK\_CONSTRAINTS table provides information about these constraints.

The CHECK\_CONSTRAINTS table has these columns:

- CONSTRAINT\_CATALOG

The name of the catalog to which the constraint belongs. This value is always def.

- CONSTRAINT\_SCHEMA

The name of the schema (database) to which the constraint belongs.

- CONSTRAINT\_NAME

The name of the constraint.

- CHECK\_CLAUSE

The expression that specifies the constraint condition.

## 28.3.6 The INFORMATION\_SCHEMA COLLATIONS Table

The `COLLATIONS` table provides information about collations for each character set.

The `COLLATIONS` table has these columns:

- `COLLATION_NAME`

The collation name.

- `CHARACTER_SET_NAME`

The name of the character set with which the collation is associated.

- `ID`

The collation ID.

- `IS_DEFAULT`

Whether the collation is the default for its character set.

- `IS_COMPILED`

Whether the character set is compiled into the server.

- `SORTLEN`

This is related to the amount of memory required to sort strings expressed in the character set.

- `PAD_ATTRIBUTE`

The collation pad attribute, either `NO PAD` or `PAD SPACE`. This attribute affects whether trailing spaces are significant in string comparisons; see [Trailing Space Handling in Comparisons](#).

### Notes

Collation information is also available from the `SHOW COLLATION` statement. See [Section 15.7.7.5, "SHOW COLLATION Statement"](#). The following statements are equivalent:

```
SELECT COLLATION_NAME FROM INFORMATION_SCHEMA.COLLATIONS
[WHERE COLLATION_NAME LIKE 'wild']

SHOW COLLATION
[LIKE 'wild']
```

## 28.3.7 The INFORMATION\_SCHEMA COLLATION\_CHARACTER\_SET\_APPLICABILITY Table

The `COLLATION_CHARACTER_SET_APPLICABILITY` table indicates what character set is applicable for what collation.

The `COLLATION_CHARACTER_SET_APPLICABILITY` table has these columns:

- `COLLATION_NAME`

The collation name.

- `CHARACTER_SET_NAME`

The name of the character set with which the collation is associated.

## Notes

The `COLLATION_CHARACTER_SET_APPLICABILITY` columns are equivalent to the first two columns displayed by the `SHOW COLLATION` statement.

### 28.3.8 The INFORMATION\_SCHEMA COLUMNS Table

The `COLUMNS` table provides information about columns in tables. The related `ST_GeOMETRY_COLUMNS` table provides information about table columns that store spatial data. See Section 28.3.35, “The INFORMATION\_SCHEMA ST\_GeOMETRY\_COLUMNS Table”.

The `COLUMNS` table has these columns:

- `TABLE_CATALOG`

The name of the catalog to which the table containing the column belongs. This value is always `def`.

- `TABLE_SCHEMA`

The name of the schema (database) to which the table containing the column belongs.

- `TABLE_NAME`

The name of the table containing the column.

- `COLUMN_NAME`

The name of the column.

- `ORDINAL_POSITION`

The position of the column within the table. `ORDINAL_POSITION` is necessary because you might want to say `ORDER BY ORDINAL_POSITION`. Unlike `SHOW COLUMNS`, `SELECT` from the `COLUMNS` table does not have automatic ordering.

- `COLUMN_DEFAULT`

The default value for the column. This is `NULL` if the column has an explicit default of `NULL`, or if the column definition includes no `DEFAULT` clause.

- `IS_NULLABLE`

The column nullability. The value is `YES` if `NULL` values can be stored in the column, `NO` if not.

- `DATA_TYPE`

The column data type.

The `DATA_TYPE` value is the type name only with no other information. The `COLUMN_TYPE` value contains the type name and possibly other information such as the precision or length.

- `CHARACTER_MAXIMUM_LENGTH`

For string columns, the maximum length in characters.

- `CHARACTER_OCTET_LENGTH`

For string columns, the maximum length in bytes.

- `NUMERIC_PRECISION`

For numeric columns, the numeric precision.

- [NUMERIC\\_SCALE](#)

For numeric columns, the numeric scale.

- [DATETIME\\_PRECISION](#)

For temporal columns, the fractional seconds precision.

- [CHARACTER\\_SET\\_NAME](#)

For character string columns, the character set name.

- [COLLATION\\_NAME](#)

For character string columns, the collation name.

- [COLUMN\\_TYPE](#)

The column data type.

The [DATA\\_TYPE](#) value is the type name only with no other information. The [COLUMN\\_TYPE](#) value contains the type name and possibly other information such as the precision or length.

- [COLUMN\\_KEY](#)

Whether the column is indexed:

- If [COLUMN\\_KEY](#) is empty, the column either is not indexed or is indexed only as a secondary column in a multiple-column, nonunique index.
- If [COLUMN\\_KEY](#) is [PRI](#), the column is a [PRIMARY KEY](#) or is one of the columns in a multiple-column [PRIMARY KEY](#).
- If [COLUMN\\_KEY](#) is [UNI](#), the column is the first column of a [UNIQUE](#) index. (A [UNIQUE](#) index permits multiple [NULL](#) values, but you can tell whether the column permits [NULL](#) by checking the [Null](#) column.)
- If [COLUMN\\_KEY](#) is [MUL](#), the column is the first column of a nonunique index in which multiple occurrences of a given value are permitted within the column.

If more than one of the [COLUMN\\_KEY](#) values applies to a given column of a table, [COLUMN\\_KEY](#) displays the one with the highest priority, in the order [PRI](#), [UNI](#), [MUL](#).

A [UNIQUE](#) index may be displayed as [PRI](#) if it cannot contain [NULL](#) values and there is no [PRIMARY KEY](#) in the table. A [UNIQUE](#) index may display as [MUL](#) if several columns form a composite [UNIQUE](#) index; although the combination of the columns is unique, each column can still hold multiple occurrences of a given value.

- [EXTRA](#)

Any additional information that is available about a given column. The value is nonempty in these cases:

- [auto\\_increment](#) for columns that have the [AUTO\\_INCREMENT](#) attribute.
- [on update CURRENT\\_TIMESTAMP](#) for [TIMESTAMP](#) or [DATETIME](#) columns that have the [ON UPDATE CURRENT\\_TIMESTAMP](#) attribute.
- [STORED GENERATED](#) or [VIRTUAL GENERATED](#) for generated columns.
- [DEFAULT\\_GENERATED](#) for columns that have an expression default value.
- [PRIVILEGES](#)

The privileges you have for the column.

- [COLUMN\\_COMMENT](#)

Any comment included in the column definition.

- [GENERATION\\_EXPRESSION](#)

For generated columns, displays the expression used to compute column values. Empty for nongenerated columns. For information about generated columns, see [Section 15.1.20.8, “CREATE TABLE and Generated Columns”](#).

- [SRS\\_ID](#)

This value applies to spatial columns. It contains the column [SRID](#) value that indicates the spatial reference system for values stored in the column. See [Section 13.4.1, “Spatial Data Types”](#), and [Section 13.4.5, “Spatial Reference System Support”](#). The value is [NULL](#) for nonspatial columns and spatial columns with no [SRID](#) attribute.

## Notes

- In [SHOW COLUMNS](#), the [Type](#) display includes values from several different [COLUMNS](#) columns.
- [CHARACTER\\_OCTET\\_LENGTH](#) should be the same as [CHARACTER\\_MAXIMUM\\_LENGTH](#), except for multibyte character sets.
- [CHARACTER\\_SET\\_NAME](#) can be derived from [COLLATION\\_NAME](#). For example, if you say [SHOW FULL COLUMNS FROM t](#), and you see in the [COLLATION\\_NAME](#) column a value of [utf8mb4\\_swedish\\_ci](#), the character set is what appears before the first underscore: [utf8mb4](#).

Column information is also available from the [SHOW COLUMNS](#) statement. See [Section 15.7.7.6, “SHOW COLUMNS Statement”](#). The following statements are nearly equivalent:

```
SELECT COLUMN_NAME, DATA_TYPE, IS_NULLABLE, COLUMN_DEFAULT
 FROM INFORMATION_SCHEMA.COLUMNS
 WHERE table_name = 'tbl_name'
 [AND table_schema = 'db_name']
 [AND column_name LIKE 'wild']

SHOW COLUMNS
 FROM tbl_name
 [FROM db_name]
 [LIKE 'wild']
```

Information about generated invisible primary key columns is visible in this table by default. You can cause such information to be hidden by setting [show\\_gipk\\_in\\_create\\_table\\_and\\_information\\_schema = OFF](#). For more information, see [Section 15.1.20.11, “Generated Invisible Primary Keys”](#).

## 28.3.9 The INFORMATION\_SCHEMA COLUMNS\_EXTENSIONS Table

The [COLUMNS\\_EXTENSIONS](#) table provides information about column attributes defined for primary and secondary storage engines.

### Note

The [COLUMNS\\_EXTENSIONS](#) table is reserved for future use.

The [COLUMNS\\_EXTENSIONS](#) table has these columns:

- [TABLE\\_CATALOG](#)

The name of the catalog to which the table belongs. This value is always `def`.

- `TABLE_SCHEMA`

The name of the schema (database) to which the table belongs.

- `TABLE_NAME`

The name of the table.

- `COLUMN_NAME`

The name of the column.

- `ENGINE_ATTRIBUTE`

Column attributes defined for the primary storage engine. Reserved for future use.

- `SECONDARY_ENGINE_ATTRIBUTE`

Column attributes defined for the secondary storage engine. Reserved for future use.

### 28.3.10 The INFORMATION\_SCHEMA COLUMN\_PRIVILEGES Table

The `COLUMN_PRIVILEGES` table provides information about column privileges. It takes its values from the `mysql.columns_priv` system table.

The `COLUMN_PRIVILEGES` table has these columns:

- `GRANTEE`

The name of the account to which the privilege is granted, in '`user_name`'@'`host_name`' format.

- `TABLE_CATALOG`

The name of the catalog to which the table containing the column belongs. This value is always `def`.

- `TABLE_SCHEMA`

The name of the schema (database) to which the table containing the column belongs.

- `TABLE_NAME`

The name of the table containing the column.

- `COLUMN_NAME`

The name of the column.

- `PRIVILEGE_TYPE`

The privilege granted. The value can be any privilege that can be granted at the column level; see [Section 15.7.1.6, “GRANT Statement”](#). Each row lists a single privilege, so there is one row per column privilege held by the grantee.

In the output from `SHOW FULL COLUMNS`, the privileges are all in one column and in lowercase, for example, `select,insert,update,references`. In `COLUMN_PRIVILEGES`, there is one privilege per row, in uppercase.

- `IS_GRANTABLE`

`YES` if the user has the `GRANT OPTION` privilege, `NO` otherwise. The output does not list `GRANT OPTION` as a separate row with `PRIVILEGE_TYPE='GRANT OPTION'`.

## Notes

- `COLUMN_PRIVILEGES` is a nonstandard `INFORMATION_SCHEMA` table.

The following statements are *not* equivalent:

```
SELECT ... FROM INFORMATION_SCHEMA.COLUMN_PRIVILEGES
SHOW GRANTS ...
```

## 28.3.11 The INFORMATION\_SCHEMA COLUMN\_STATISTICS Table

The `COLUMN_STATISTICS` table provides access to histogram statistics for column values.

For information about histogram statistics, see [Section 10.9.6, “Optimizer Statistics”](#), and [Section 15.7.3.1, “ANALYZE TABLE Statement”](#).

You can see information only for columns for which you have some privilege.

The `COLUMN_STATISTICS` table has these columns:

- `SCHEMA_NAME`

The names of the schema for which the statistics apply.

- `TABLE_NAME`

The names of the column for which the statistics apply.

- `COLUMN_NAME`

The names of the column for which the statistics apply.

- `HISTOGRAM`

A `JSON` object describing the column statistics, stored as a histogram.

## 28.3.12 The INFORMATION\_SCHEMA ENABLED\_ROLES Table

The `ENABLED_ROLES` table provides information about the roles that are enabled within the current session.

The `ENABLED_ROLES` table has these columns:

- `ROLE_NAME`

The user name part of the granted role.

- `ROLE_HOST`

The host name part of the granted role.

- `IS_DEFAULT`

`YES` or `NO`, depending on whether the role is a default role.

- `IS_MANDATORY`

`YES` or `NO`, depending on whether the role is mandatory.

## 28.3.13 The INFORMATION\_SCHEMA ENGINES Table

The `ENGINES` table provides information about storage engines. This is particularly useful for checking whether a storage engine is supported, or to see what the default engine is.

The `ENGINES` table has these columns:

- `ENGINE`

The name of the storage engine.

- `SUPPORT`

The server's level of support for the storage engine, as shown in the following table.

Value	Meaning
<code>YES</code>	The engine is supported and is active
<code>DEFAULT</code>	Like <code>YES</code> , plus this is the default engine
<code>NO</code>	The engine is not supported
<code>DISABLED</code>	The engine is supported but has been disabled

A value of `NO` means that the server was compiled without support for the engine, so it cannot be enabled at runtime.

A value of `DISABLED` occurs either because the server was started with an option that disables the engine, or because not all options required to enable it were given. In the latter case, the error log should contain a reason indicating why the option is disabled. See [Section 7.4.2, “The Error Log”](#).

You might also see `DISABLED` for a storage engine if the server was compiled to support it, but was started with a `--skip-engine_name` option. For the `NDB` storage engine, `DISABLED` means the server was compiled with support for NDB Cluster, but was not started with the `--ndbcluster` option.

All MySQL servers support `MyISAM` tables. It is not possible to disable `MyISAM`.

- `COMMENT`

A brief description of the storage engine.

- `TRANSACTIONS`

Whether the storage engine supports transactions.

- `XA`

Whether the storage engine supports XA transactions.

- `SAVEPOINTS`

Whether the storage engine supports savepoints.

## Notes

- `ENGINES` is a nonstandard `INFORMATION_SCHEMA` table.

Storage engine information is also available from the `SHOW ENGINES` statement. See [Section 15.7.7.17, “SHOW ENGINES Statement”](#). The following statements are equivalent:

```
SELECT * FROM INFORMATION_SCHEMA.ENGINES
SHOW ENGINES
```

## 28.3.14 The INFORMATION\_SCHEMA EVENTS Table

The `EVENTS` table provides information about Event Manager events, which are discussed in Section 27.4, “Using the Event Scheduler”.

The `EVENTS` table has these columns:

- `EVENT_CATALOG`

The name of the catalog to which the event belongs. This value is always `def`.

- `EVENT_SCHEMA`

The name of the schema (database) to which the event belongs.

- `EVENT_NAME`

The name of the event.

- `DEFINER`

The account named in the `DEFINER` clause (often the user who created the event), in `'user_name' '@' host_name'` format.

- `TIME_ZONE`

The event time zone, which is the time zone used for scheduling the event and that is in effect within the event as it executes. The default value is `SYSTEM`.

- `EVENT_BODY`

The language used for the statements in the event's `DO` clause. The value is always `SQL`.

- `EVENT_DEFINITION`

The text of the SQL statement making up the event's `DO` clause; in other words, the statement executed by this event.

- `EVENT_TYPE`

The event repetition type, either `ONE TIME` (transient) or `RECURRING` (repeating).

- `EXECUTE_AT`

For a one-time event, this is the `DATETIME` value specified in the `AT` clause of the `CREATE EVENT` statement used to create the event, or of the last `ALTER EVENT` statement that modified the event. The value shown in this column reflects the addition or subtraction of any `INTERVAL` value included in the event's `AT` clause. For example, if an event is created using `ON SCHEDULE AT CURRENT_TIMESTAMP + '1:6' DAY_HOUR`, and the event was created at 2018-02-09 14:05:30, the value shown in this column would be `'2018-02-10 20:05:30'`. If the event's timing is determined by an `EVERY` clause instead of an `AT` clause (that is, if the event is recurring), the value of this column is `NULL`.

- `INTERVAL_VALUE`

For a recurring event, the number of intervals to wait between event executions. For a transient event, the value is always `NULL`.

- `INTERVAL_FIELD`

The time units used for the interval which a recurring event waits before repeating. For a transient event, the value is always `NULL`.

- `SQL_MODE`

The SQL mode in effect when the event was created or altered, and under which the event executes. For the permitted values, see [Section 7.1.11, “Server SQL Modes”](#).

- [STARTS](#)

The start date and time for a recurring event. This is displayed as a `DATETIME` value, and is `NULL` if no start date and time are defined for the event. For a transient event, this column is always `NULL`. For a recurring event whose definition includes a `STARTS` clause, this column contains the corresponding `DATETIME` value. As with the `EXECUTE_AT` column, this value resolves any expressions used. If there is no `STARTS` clause affecting the timing of the event, this column is `NULL`.

- [ENDS](#)

For a recurring event whose definition includes a `ENDS` clause, this column contains the corresponding `DATETIME` value. As with the `EXECUTE_AT` column, this value resolves any expressions used. If there is no `ENDS` clause affecting the timing of the event, this column is `NULL`.

- [STATUS](#)

The event status. One of `ENABLED`, `DISABLED`, or `REPLICA_SIDE_DISABLED` (prior to MySQL 8.2.0, this was `SLAVESIDE_DISABLED`, now deprecated). `REPLICA_SIDE_DISABLED` indicates that the creation of the event occurred on another MySQL server acting as a replication source and replicated to the current MySQL server which is acting as a replica, but the event is not presently being executed on the replica. For more information, see [Section 19.5.1.16, “Replication of Invoked Features”](#). information.

- [ON\\_COMPLETION](#)

One of the two values `PRESERVE` or `NOT PRESERVE`.

- [CREATED](#)

The date and time when the event was created. This is a `TIMESTAMP` value.

- [LAST\\_ALTERED](#)

The date and time when the event was last modified. This is a `TIMESTAMP` value. If the event has not been modified since its creation, this value is the same as the `CREATED` value.

- [LAST\\_EXECUTED](#)

The date and time when the event last executed. This is a `DATETIME` value. If the event has never executed, this column is `NULL`.

`LAST_EXECUTED` indicates when the event started. As a result, the `ENDS` column is never less than `LAST_EXECUTED`.

- [EVENT\\_COMMENT](#)

The text of the comment, if the event has one. If not, this value is empty.

- [ORIGINATOR](#)

The server ID of the MySQL server on which the event was created; used in replication. This value may be updated by `ALTER EVENT` to the server ID of the server on which that statement occurs, if executed on a replication source. The default value is 0.

- [CHARACTER\\_SET\\_CLIENT](#)

The session value of the `character_set_client` system variable when the event was created.

- [COLLATION\\_CONNECTION](#)

The session value of the `collation_connection` system variable when the event was created.

- `DATABASE_COLLATION`

The collation of the database with which the event is associated.

## Notes

- `EVENTS` is a nonstandard `INFORMATION_SCHEMA` table.
- Times in the `EVENTS` table are displayed using the event time zone, the current session time zone, or UTC, as described in [Section 27.4.4, “Event Metadata”](#).
- For more information about `REPLICA_SIDE_DISABLED` and the `ORIGINATOR` column, see [Section 19.5.1.16, “Replication of Invoked Features”](#).

## Example

Suppose that the user '`jon'@'ghidora'`' creates an event named `e_daily`, and then modifies it a few minutes later using an `ALTER EVENT` statement, as shown here:

```
DELIMITER |

CREATE EVENT e_daily
 ON SCHEDULE
 EVERY 1 DAY
 COMMENT 'Saves total number of sessions then clears the table each day'
 DO
 BEGIN
 INSERT INTO site_activity.totals (time, total)
 SELECT CURRENT_TIMESTAMP, COUNT(*)
 FROM site_activity.sessions;
 DELETE FROM site_activity.sessions;
 END |

DELIMITER ;

ALTER EVENT e_daily
 ENABLE;
```

(Note that comments can span multiple lines.)

This user can then run the following `SELECT` statement, and obtain the output shown:

```
mysql> SELECT * FROM INFORMATION_SCHEMA.EVENTS
 WHERE EVENT_NAME = 'e_daily'
 AND EVENT_SCHEMA = 'myschema'\G
***** 1. row *****
EVENT_CATALOG: def
EVENT_SCHEMA: myschema
EVENT_NAME: e_daily
DEFINER: jon@ghidora
TIME_ZONE: SYSTEM
EVENT_BODY: SQL
EVENT_DEFINITION: BEGIN
 INSERT INTO site_activity.totals (time, total)
 SELECT CURRENT_TIMESTAMP, COUNT(*)
 FROM site_activity.sessions;
 DELETE FROM site_activity.sessions;
END
EVENT_TYPE: RECURRING
EXECUTE_AT: NULL
INTERVAL_VALUE: 1
INTERVAL_FIELD: DAY
SQL_MODE: ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES,
NO_ZERO_IN_DATE,NO_ZERO_DATE,

Event information is also available from the `SHOW EVENTS` statement. See [Section 15.7.7.19, “SHOW EVENTS Statement”](#). The following statements are equivalent:

```

SELECT
 EVENT_SCHEMA, EVENT_NAME, DEFINER, TIME_ZONE, EVENT_TYPE, EXECUTE_AT,
 INTERVAL_VALUE, INTERVAL_FIELD, STARTS, ENDS, STATUS, ORIGINATOR,
 CHARACTER_SET_CLIENT, COLLATION_CONNECTION, DATABASE_COLLATION
FROM INFORMATION_SCHEMA.EVENTS
WHERE table_schema = 'db_name'
 [AND column_name LIKE 'wild']

SHOW EVENTS
 [FROM db_name]
 [LIKE 'wild']

```

## 28.3.15 The INFORMATION\_SCHEMA FILES Table

The `FILES` table provides information about the files in which MySQL tablespace data is stored.

The `FILES` table provides information about InnoDB data files. In NDB Cluster, this table also provides information about the files in which NDB Cluster Disk Data tables are stored. For additional information specific to InnoDB, see [InnoDB Notes](#), later in this section; for additional information specific to NDB Cluster, see [NDB Notes](#).

The `FILES` table has these columns:

- `FILE_ID`

For InnoDB: The tablespace ID, also referred to as the `space_id` or `fil_space_t::id`.

For NDB: A file identifier. `FILE_ID` column values are auto-generated.

- `FILE_NAME`

For InnoDB: The name of the data file. File-per-table and general tablespaces have an `.ibd` file name extension. Undo tablespaces are prefixed by `undo`. The system tablespace is prefixed by `ibdata`. The global temporary tablespace is prefixed by `ibtmp`. The file name includes the file path, which may be relative to the MySQL data directory (the value of the `datadir` system variable).

For NDB: The name of an undo log file created by `CREATE LOGFILE GROUP` or `ALTER LOGFILE GROUP`, or of a data file created by `CREATE TABLESPACE` or `ALTER TABLESPACE`. In NDB 8.4, the file name is shown with a relative path; for an undo log file, this path is relative to the directory `DataDir/ndb_NodeId_fs/LG`; for a data file, it is relative to the directory `DataDir/ndb_NodeId_fs/TS`. This means, for example, that the name of a data file created with `ALTER TABLESPACE ts ADD DATAFILE 'data_2.dat' INITIAL SIZE 256M` is shown as `./data_2.dat`.

- `FILE_TYPE`

For InnoDB: The tablespace file type. There are three possible file types for InnoDB files. `TABLESPACE` is the file type for any system, general, or file-per-table tablespace file that holds

tables, indexes, or other forms of user data. `TEMPORARY` is the file type for temporary tablespaces. `UNDO LOG` is the file type for undo tablespaces, which hold undo records.

For `NDB`: One of the values `UNDO LOG` or `DATAFILE`.

- `TABLESPACE_NAME`

The name of the tablespace with which the file is associated.

For `InnoDB`: General tablespace names are as specified when created. File-per-table tablespace names are shown in the following format: `schema_name/table_name`. The `InnoDB` system tablespace name is `innodb_system`. The global temporary tablespace name is `innodb_temporary`. Default undo tablespace names are `innodb_undo_001` and `innodb_undo_002`. User-created undo tablespace names are as specified when created.

- `TABLE_CATALOG`

This value is always empty.

- `TABLE_SCHEMA`

This is always `NULL`.

- `TABLE_NAME`

This is always `NULL`.

- `LOGFILE_GROUP_NAME`

For `InnoDB`: This is always `NULL`.

For `NDB`: The name of the log file group to which the log file or data file belongs.

- `LOGFILE_GROUP_NUMBER`

For `InnoDB`: This is always `NULL`.

For `NDB`: For a Disk Data undo log file, the auto-generated ID number of the log file group to which the log file belongs. This is the same as the value shown for the `id` column in the `ndbinfo.dict_obj_info` table and the `log_id` column in the `ndbinfo.logspaces` and `ndbinfo.logslices` tables for this undo log file.

- `ENGINE`

For `InnoDB`: This value is always `InnoDB`.

For `NDB`: This value is always `ndbcluster`.

- `FULLTEXT_KEYS`

This is always `NULL`.

- `DELETED_ROWS`

This is always `NULL`.

- `UPDATE_COUNT`

This is always `NULL`.

- `FREE_EXTENTS`

For `InnoDB`: The number of fully free extents in the current data file.

For **NDB**: The number of extents which have not yet been used by the file.

- **TOTAL\_EXTENTS**

For **InnoDB**: The number of full extents used in the current data file. Any partial extent at the end of the file is not counted.

For **NDB**: The total number of extents allocated to the file.

- **EXTENT\_SIZE**

For **InnoDB**: Extent size is 1048576 (1MB) for files with a 4KB, 8KB, or 16KB page size. Extent size is 2097152 bytes (2MB) for files with a 32KB page size, and 4194304 (4MB) for files with a 64KB page size. **FILES** does not report **InnoDB** page size. Page size is defined by the **innodb\_page\_size** system variable. Extent size information can also be retrieved from the **INNODB\_TABLESPACES** table where **FILES.FILE\_ID = INNODB\_TABLESPACES.SPACE**.

For **NDB**: The size of an extent for the file in bytes.

- **INITIAL\_SIZE**

For **InnoDB**: The initial size of the file in bytes.

For **NDB**: The size of the file in bytes. This is the same value that was used in the **INITIAL\_SIZE** clause of the **CREATE LOGFILE GROUP**, **ALTER LOGFILE GROUP**, **CREATE TABLESPACE**, or **ALTER TABLESPACE** statement used to create the file.

- **MAXIMUM\_SIZE**

For **InnoDB**: The maximum number of bytes permitted in the file. The value is **NULL** for all data files except for predefined system tablespace data files. Maximum system tablespace file size is defined by **innodb\_data\_file\_path**. Maximum global temporary tablespace file size is defined by **innodb\_temp\_data\_file\_path**. A **NULL** value for a predefined system tablespace data file indicates that a file size limit was not defined explicitly.

For **NDB**: This value is always the same as the **INITIAL\_SIZE** value.

- **AUTOEXTEND\_SIZE**

The auto-extend size of the tablespace. For **NDB**, **AUTOEXTEND\_SIZE** is always **NULL**.

- **CREATION\_TIME**

This is always **NULL**.

- **LAST\_UPDATE\_TIME**

This is always **NULL**.

- **LAST\_ACCESS\_TIME**

This is always **NULL**.

- **RECOVER\_TIME**

This is always **NULL**.

- **TRANSACTION\_COUNTER**

This is always **NULL**.

- **VERSION**

For [InnoDB](#): This is always [NULL](#).

For [NDB](#): The version number of the file.

- [ROW\\_FORMAT](#)

For [InnoDB](#): This is always [NULL](#).

For [NDB](#): One of [FIXED](#) or [DYNAMIC](#).

- [TABLE\\_ROWS](#)

This is always [NULL](#).

- [AVG\\_ROW\\_LENGTH](#)

This is always [NULL](#).

- [DATA\\_LENGTH](#)

This is always [NULL](#).

- [MAX\\_DATA\\_LENGTH](#)

This is always [NULL](#).

- [INDEX\\_LENGTH](#)

This is always [NULL](#).

- [DATA\\_FREE](#)

For [InnoDB](#): The total amount of free space (in bytes) for the entire tablespace. Predefined system tablespaces, which include the system tablespace and temporary table tablespaces, may have one or more data files.

For [NDB](#): This is always [NULL](#).

- [CREATE\\_TIME](#)

This is always [NULL](#).

- [UPDATE\\_TIME](#)

This is always [NULL](#).

- [CHECK\\_TIME](#)

This is always [NULL](#).

- [CHECKSUM](#)

This is always [NULL](#).

- [STATUS](#)

For [InnoDB](#): This value is [NORMAL](#) by default. [InnoDB](#) file-per-table tablespaces may report [IMPORTING](#), which indicates that the tablespace is not yet available.

For [NDB](#): For NDB Cluster Disk Data files, this value is always [NORMAL](#).

- [EXTRA](#)

For [InnoDB](#): This is always [NULL](#).

For `NDB`: For undo log files, this column shows the undo log buffer size; for data files, it is always `NULL`. A more detailed explanation is provided in the next few paragraphs.

`NDB` stores a copy of each data file and each undo log file on each data node in the cluster. The `FILES` table contains one row for each such file. Suppose that you run the following two statements on an NDB Cluster with four data nodes:

```
CREATE LOGFILE GROUP mygroup
 ADD UNDOFILE 'new_undo.dat'
 INITIAL_SIZE 2G
 ENGINE NDBCLUSTER;

CREATE TABLESPACE mys
 ADD DATAFILE 'data_1.dat'
 USE LOGFILE GROUP mygroup
 INITIAL_SIZE 256M
 ENGINE NDBCLUSTER;
```

After running these two statements successfully, you should see a result similar to the one shown here for this query against the `FILES` table:

```
mysql> SELECT LOGFILE_GROUP_NAME, FILE_TYPE, EXTRA
-> FROM INFORMATION_SCHEMA.FILES
-> WHERE ENGINE = 'ndbcluster';

+-----+-----+-----+
| LOGFILE_GROUP_NAME | FILE_TYPE | EXTRA
+-----+-----+-----+
| mygroup | UNDO LOG | UNDO_BUFFER_SIZE=8388608 |
| mygroup | DATAFILE | NULL
+-----+-----+-----+
```

## Notes

- `FILES` is a nonstandard `INFORMATION_SCHEMA` table.
- You must have the `PROCESS` privilege to query this table.

## InnoDB Notes

The following notes apply to `InnoDB` data files.

- Information reported by `FILES` is obtained from the `InnoDB` in-memory cache for open files, whereas `INNODB_DATAFILES` gets its data from the `InnoDB SYS_DATAFILES` internal data dictionary table.
- The information provided by `FILES` includes global temporary tablespace information which is not available in the `InnoDB SYS_DATAFILES` internal data dictionary table, and is therefore not included in `INNODB_DATAFILES`.
- Undo tablespace information is shown in `FILES` when separate undo tablespaces are present, as they are by default in MySQL 8.4.
- The following query returns all `FILES` table information relating to `InnoDB` tablespaces.

```
SELECT
 FILE_ID, FILE_NAME, FILE_TYPE, TABLESPACE_NAME, FREE_EXTENTS,
 TOTAL_EXTENTS, EXTENT_SIZE, INITIAL_SIZE, MAXIMUM_SIZE,
 AUTOEXTEND_SIZE, DATA_FREE, STATUS
FROM INFORMATION_SCHEMA.FILES
WHERE ENGINE='InnoDB'\G
```

## NDB Notes

- The `FILES` table provides information about Disk Data *files* only; you cannot use it for determining disk space allocation or availability for individual `NDB` tables. However, it is possible to see how much

space is allocated for each NDB table having data stored on disk—as well as how much remains available for storage of data on disk for that table—using `ndb_desc`.

- Much of the information contained in the `FILES` table can also be found in the `ndbinfo files` table.
- The `CREATION_TIME`, `LAST_UPDATE_TIME`, and `LAST_ACCESSED` values are as reported by the operating system, and are not supplied by the NDB storage engine. Where no value is provided by the operating system, these columns display `NULL`.
- The difference between the `TOTAL_EXTENTS` and `FREE_EXTENTS` columns is the number of extents currently in use by the file:

```
SELECT TOTAL_EXTENTS - FREE_EXTENTS AS extents_used
 FROM INFORMATION_SCHEMA.FILES
 WHERE FILE_NAME = './myfile.dat';
```

To approximate the amount of disk space in use by the file, multiply that difference by the value of the `EXTENT_SIZE` column, which gives the size of an extent for the file in bytes:

```
SELECT (TOTAL_EXTENTS - FREE_EXTENTS) * EXTENT_SIZE AS bytes_used
 FROM INFORMATION_SCHEMA.FILES
 WHERE FILE_NAME = './myfile.dat';
```

Similarly, you can estimate the amount of space that remains available in a given file by multiplying `FREE_EXTENTS` by `EXTENT_SIZE`:

```
SELECT FREE_EXTENTS * EXTENT_SIZE AS bytes_free
 FROM INFORMATION_SCHEMA.FILES
 WHERE FILE_NAME = './myfile.dat';
```

### Important

The byte values produced by the preceding queries are approximations only, and their precision is inversely proportional to the value of `EXTENT_SIZE`. That is, the larger `EXTENT_SIZE` becomes, the less accurate the approximations are.

It is also important to remember that once an extent is used, it cannot be freed again without dropping the data file of which it is a part. This means that deletes from a Disk Data table do *not* release disk space.

The extent size can be set in a `CREATE TABLESPACE` statement. For more information, see [Section 15.1.21, “CREATE TABLESPACE Statement”](#).

- You can obtain information about Disk Data tablespaces using the `ndb_desc` utility. For more information, see [Section 25.6.11.1, “NDB Cluster Disk Data Objects”](#), as well as the description of `ndb_desc`.
- For additional information, and examples of creating, dropping, and obtaining information about NDB Cluster Disk Data objects, see [Section 25.6.11, “NDB Cluster Disk Data Tables”](#).

## 28.3.16 The INFORMATION\_SCHEMA KEY\_COLUMN\_USAGE Table

The `KEY_COLUMN_USAGE` table describes which key columns have constraints. This table provides no information about functional key parts because they are expressions and the table provides information only about columns.

The `KEY_COLUMN_USAGE` table has these columns:

- `CONSTRAINT_CATALOG`

The name of the catalog to which the constraint belongs. This value is always `def`.

- **CONSTRAINT\_SCHEMA**

The name of the schema (database) to which the constraint belongs.

- **CONSTRAINT\_NAME**

The name of the constraint.

- **TABLE\_CATALOG**

The name of the catalog to which the table belongs. This value is always `def`.

- **TABLE\_SCHEMA**

The name of the schema (database) to which the table belongs.

- **TABLE\_NAME**

The name of the table that has the constraint.

- **COLUMN\_NAME**

The name of the column that has the constraint.

If the constraint is a foreign key, then this is the column of the foreign key, not the column that the foreign key references.

- **ORDINAL\_POSITION**

The column's position within the constraint, not the column's position within the table. Column positions are numbered beginning with 1.

- **POSITION\_IN\_UNIQUE\_CONSTRAINT**

`NULL` for unique and primary-key constraints. For foreign-key constraints, this column is the ordinal position in key of the table that is being referenced.

- **REFERENCED\_TABLE\_SCHEMA**

The name of the schema referenced by the constraint.

- **REFERENCED\_TABLE\_NAME**

The name of the table referenced by the constraint.

- **REFERENCED\_COLUMN\_NAME**

The name of the column referenced by the constraint.

Suppose that there are two tables name `t1` and `t3` that have the following definitions:

```
CREATE TABLE t1
(
 s1 INT,
 s2 INT,
 s3 INT,
 PRIMARY KEY(s3)
) ENGINE=InnoDB;

CREATE TABLE t3
(
 s1 INT,
 s2 INT,
 s3 INT,
 KEY(s1),
 CONSTRAINT CO FOREIGN KEY (s2) REFERENCES t1(s3)
```

```
) ENGINE=InnoDB;
```

For those two tables, the `KEY_COLUMN_USAGE` table has two rows:

- One row with `CONSTRAINT_NAME = 'PRIMARY'`, `TABLE_NAME = 't1'`, `COLUMN_NAME = 's3'`, `ORDINAL_POSITION = 1`, `POSITION_IN_UNIQUE_CONSTRAINT = NULL`.

For `NDB`: This value is always `NULL`.

- One row with `CONSTRAINT_NAME = 'CO'`, `TABLE_NAME = 't3'`, `COLUMN_NAME = 's2'`, `ORDINAL_POSITION = 1`, `POSITION_IN_UNIQUE_CONSTRAINT = 1`.

### 28.3.17 The INFORMATION\_SCHEMA KEYWORDS Table

The `KEYWORDS` table lists the words considered keywords by MySQL and, for each one, indicates whether it is reserved. Reserved keywords may require special treatment in some contexts, such as special quoting when used as identifiers (see [Section 11.3, “Keywords and Reserved Words”](#)). This table provides applications a runtime source of MySQL keyword information.

The `KEYWORDS` table has these columns:

- `WORD`

The keyword.

- `RESERVED`

An integer indicating whether the keyword is reserved (1) or nonreserved (0).

These queries lists all keywords, all reserved keywords, and all nonreserved keywords, respectively:

```
SELECT * FROM INFORMATION_SCHEMA.KEYWORDS;
SELECT WORD FROM INFORMATION_SCHEMA.KEYWORDS WHERE RESERVED = 1;
SELECT WORD FROM INFORMATION_SCHEMA.KEYWORDS WHERE RESERVED = 0;
```

The latter two queries are equivalent to:

```
SELECT WORD FROM INFORMATION_SCHEMA.KEYWORDS WHERE RESERVED;
SELECT WORD FROM INFORMATION_SCHEMA.KEYWORDS WHERE NOT RESERVED;
```

If you build MySQL from source, the build process generates a `keyword_list.h` header file containing an array of keywords and their reserved status. This file can be found in the `sql` directory under the build directory. This file may be useful for applications that require a static source for the keyword list.

### 28.3.18 The INFORMATION\_SCHEMA ndb\_transid\_mysql\_connection\_map Table

The `ndb_transid_mysql_connection_map` table provides a mapping between `NDB` transactions, `NDB` transaction coordinators, and MySQL Servers attached to an NDB Cluster as API nodes. This information is used when populating the `server_operations` and `server_transactions` tables of the `ndbinfo` NDB Cluster information database.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
<code>mysql_connection_id</code>		MySQL Server connection ID
<code>node_id</code>		Transaction coordinator node ID
<code>ndb_transid</code>		<code>NDB</code> transaction ID

The `mysql_connection_id` is the same as the connection or session ID shown in the output of `SHOW PROCESSLIST`.

There are no `SHOW` statements associated with this table.

This is a nonstandard table, specific to NDB Cluster. It is implemented as an `INFORMATION_SCHEMA` plugin; you can verify that it is supported by checking the output of `SHOW PLUGINS`. If `ndb_transid_mysql_connection_map` support is enabled, the output from this statement includes a plugin having this name, of type `INFORMATION SCHEMA`, and having status `ACTIVE`, as shown here (using emphasized text):

Name	Status	Type	Library	License
binlog	ACTIVE	STORAGE ENGINE	NULL	GPL
mysql_native_password	ACTIVE	AUTHENTICATION	NULL	GPL
sha256_password	ACTIVE	AUTHENTICATION	NULL	GPL
caching_sha2_password	ACTIVE	AUTHENTICATION	NULL	GPL
sha2_cache_cleaner	ACTIVE	AUDIT	NULL	GPL
daemon_keyring_proxy_plugin	ACTIVE	DAEMON	NULL	GPL
CSV	ACTIVE	STORAGE ENGINE	NULL	GPL
MEMORY	ACTIVE	STORAGE ENGINE	NULL	GPL
InnoDB	ACTIVE	STORAGE ENGINE	NULL	GPL
INNODB_TRX	ACTIVE	INFORMATION SCHEMA	NULL	GPL
INNODB_CMP	ACTIVE	INFORMATION SCHEMA	NULL	GPL
<hr/>				
...				
INNODB_SESSION_TEMP_TABLESPACES	ACTIVE	INFORMATION SCHEMA	NULL	GPL
MyISAM	ACTIVE	STORAGE ENGINE	NULL	GPL
MRG_MYISAM	ACTIVE	STORAGE ENGINE	NULL	GPL
PERFORMANCE_SCHEMA	ACTIVE	STORAGE ENGINE	NULL	GPL
TempTable	ACTIVE	STORAGE ENGINE	NULL	GPL
ARCHIVE	ACTIVE	STORAGE ENGINE	NULL	GPL
BLACKHOLE	ACTIVE	STORAGE ENGINE	NULL	GPL
ndbcluster	ACTIVE	STORAGE ENGINE	NULL	GPL
ndbinfo	ACTIVE	STORAGE ENGINE	NULL	GPL
ndb_transid_mysql_connection_map	ACTIVE	INFORMATION SCHEMA	NULL	GPL
ngram	ACTIVE	FTPARSER	NULL	GPL
mysqlx_cache_cleaner	ACTIVE	AUDIT	NULL	GPL
mysqlx	ACTIVE	DAEMON	NULL	GPL

47 rows in set (0.01 sec)

The plugin is enabled by default. You can disable it (or force the server not to run unless the plugin starts) by starting the server with the `--ndb-transid-mysql-connection-map` option. If the plugin is disabled, the status is shown by `SHOW PLUGINS` as `DISABLED`. The plugin cannot be enabled or disabled at runtime.

Although the names of this table and its columns are displayed using lowercase, you can use uppercase or lowercase when referring to them in SQL statements.

For this table to be created, the MySQL Server must be a binary supplied with the NDB Cluster distribution, or one built from the NDB Cluster sources with `NDB` storage engine support enabled. It is not available in the standard MySQL 8.4 Server.

### 28.3.19 The INFORMATION\_SCHEMA OPTIMIZER\_TRACE Table

The `OPTIMIZER_TRACE` table provides information produced by the optimizer tracing capability for traced statements. To enable tracking, use the `optimizer_trace` system variable. For details, see [Section 10.15, “Tracing the Optimizer”](#).

The `OPTIMIZER_TRACE` table has these columns:

- `QUERY`

The text of the traced statement.

- [TRACE](#)

The trace, in [JSON](#) format.

- [MISSING\\_BYTES\\_BEYOND\\_MAX\\_MEM\\_SIZE](#)

Each remembered trace is a string that is extended as optimization progresses and appends data to it. The [optimizer\\_trace\\_max\\_mem\\_size](#) variable sets a limit on the total amount of memory used by all currently remembered traces. If this limit is reached, the current trace is not extended (and thus is incomplete), and the [MISSING\\_BYTES\\_BEYOND\\_MAX\\_MEM\\_SIZE](#) column shows the number of bytes missing from the trace.

- [INSUFFICIENT\\_PRIVILEGES](#)

If a traced query uses views or stored routines that have [SQL SECURITY](#) with a value of [DEFINER](#), it may be that a user other than the definer is denied from seeing the trace of the query. In that case, the trace is shown as empty and [INSUFFICIENT\\_PRIVILEGES](#) has a value of 1. Otherwise, the value is 0.

### 28.3.20 The INFORMATION\_SCHEMA PARAMETERS Table

The [PARAMETERS](#) table provides information about parameters for stored routines (stored procedures and stored functions), and about return values for stored functions. The [PARAMETERS](#) table does not include built-in (native) functions or loadable functions.

The [PARAMETERS](#) table has these columns:

- [SPECIFIC\\_CATALOG](#)

The name of the catalog to which the routine containing the parameter belongs. This value is always [def](#).

- [SPECIFIC\\_SCHEMA](#)

The name of the schema (database) to which the routine containing the parameter belongs.

- [SPECIFIC\\_NAME](#)

The name of the routine containing the parameter.

- [ORDINAL\\_POSITION](#)

For successive parameters of a stored procedure or function, the [ORDINAL\\_POSITION](#) values are 1, 2, 3, and so forth. For a stored function, there is also a row that applies to the function return value (as described by the [RETURNS](#) clause). The return value is not a true parameter, so the row that describes it has these unique characteristics:

- The [ORDINAL\\_POSITION](#) value is 0.

• The [PARAMETER\\_NAME](#) and [PARAMETER\\_MODE](#) values are [NULL](#) because the return value has no name and the mode does not apply.

- [PARAMETER\\_MODE](#)

The mode of the parameter. This value is one of [IN](#), [OUT](#), or [INOUT](#). For a stored function return value, this value is [NULL](#).

- [PARAMETER\\_NAME](#)

The name of the parameter. For a stored function return value, this value is [NULL](#).

- [DATA\\_TYPE](#)

The parameter data type.

The `DATA_TYPE` value is the type name only with no other information. The `DTD_IDENTIFIER` value contains the type name and possibly other information such as the precision or length.

- `CHARACTER_MAXIMUM_LENGTH`

For string parameters, the maximum length in characters.

- `CHARACTER_OCTET_LENGTH`

For string parameters, the maximum length in bytes.

- `NUMERIC_PRECISION`

For numeric parameters, the numeric precision.

- `NUMERIC_SCALE`

For numeric parameters, the numeric scale.

- `DATETIME_PRECISION`

For temporal parameters, the fractional seconds precision.

- `CHARACTER_SET_NAME`

For character string parameters, the character set name.

- `COLLATION_NAME`

For character string parameters, the collation name.

- `DTD_IDENTIFIER`

The parameter data type.

The `DATA_TYPE` value is the type name only with no other information. The `DTD_IDENTIFIER` value contains the type name and possibly other information such as the precision or length.

- `ROUTINE_TYPE`

`PROCEDURE` for stored procedures, `FUNCTION` for stored functions.

### 28.3.21 The INFORMATION\_SCHEMA PARTITIONS Table

The `PARTITIONS` table provides information about table partitions. Each row in this table corresponds to an individual partition or subpartition of a partitioned table. For more information about partitioning tables, see [Chapter 26, Partitioning](#).

The `PARTITIONS` table has these columns:

- `TABLE_CATALOG`

The name of the catalog to which the table belongs. This value is always `def`.

- `TABLE_SCHEMA`

The name of the schema (database) to which the table belongs.

- `TABLE_NAME`

The name of the table containing the partition.

- **PARTITION\_NAME**

The name of the partition.

- **SUBPARTITION\_NAME**

If the `PARTITIONS` table row represents a subpartition, the name of subpartition; otherwise `NULL`.

For `NDB`: This value is always `NULL`.

- **PARTITION\_ORDINAL\_POSITION**

All partitions are indexed in the same order as they are defined, with `1` being the number assigned to the first partition. The indexing can change as partitions are added, dropped, and reorganized; the number shown is this column reflects the current order, taking into account any indexing changes.

- **SUBPARTITION\_ORDINAL\_POSITION**

Subpartitions within a given partition are also indexed and reindexed in the same manner as partitions are indexed within a table.

- **PARTITION\_METHOD**

One of the values `RANGE`, `LIST`, `HASH`, `LINEAR HASH`, `KEY`, or `LINEAR KEY`; that is, one of the available partitioning types as discussed in [Section 26.2, “Partitioning Types”](#).

- **SUBPARTITION\_METHOD**

One of the values `HASH`, `LINEAR HASH`, `KEY`, or `LINEAR KEY`; that is, one of the available subpartitioning types as discussed in [Section 26.2.6, “Subpartitioning”](#).

- **PARTITION\_EXPRESSION**

The expression for the partitioning function used in the `CREATE TABLE` or `ALTER TABLE` statement that created the table's current partitioning scheme.

For example, consider a partitioned table created in the `test` database using this statement:

```
CREATE TABLE tp (
 c1 INT,
 c2 INT,
 c3 VARCHAR(25)
)
PARTITION BY HASH(c1 + c2)
PARTITIONS 4;
```

The `PARTITION_EXPRESSION` column in a `PARTITIONS` table row for a partition from this table displays `c1 + c2`, as shown here:

```
mysql> SELECT DISTINCT PARTITION_EXPRESSION
 FROM INFORMATION_SCHEMA.PARTITIONS
 WHERE TABLE_NAME='tp' AND TABLE_SCHEMA='test';
+-----+
| PARTITION_EXPRESSION |
+-----+
| c1 + c2 |
+-----+
```

For a table that is not explicitly partitioned, this column is always `NULL`, regardless of storage engine.

- **SUBPARTITION\_EXPRESSION**

This works in the same fashion for the subpartitioning expression that defines the subpartitioning for a table as `PARTITION_EXPRESSION` does for the partitioning expression used to define a table's partitioning.

If the table has no subpartitions, this column is `NULL`.

- [PARTITION\\_DESCRIPTION](#)

This column is used for RANGE and LIST partitions. For a `RANGE` partition, it contains the value set in the partition's `VALUES LESS THAN` clause, which can be either an integer or `MAXVALUE`. For a `LIST` partition, this column contains the values defined in the partition's `VALUES IN` clause, which is a list of comma-separated integer values.

For partitions whose `PARTITION_METHOD` is other than `RANGE` or `LIST`, this column is always `NULL`.

- [TABLE\\_ROWS](#)

The number of table rows in the partition.

For partitioned `InnoDB` tables, the row count given in the `TABLE_ROWS` column is only an estimated value used in SQL optimization, and may not always be exact.

For `NDB` tables, you can also obtain this information using the `ndb_desc` utility.

- [AVG\\_ROW\\_LENGTH](#)

The average length of the rows stored in this partition or subpartition, in bytes. This is the same as `DATA_LENGTH` divided by `TABLE_ROWS`.

For `NDB` tables, you can also obtain this information using the `ndb_desc` utility.

- [DATA\\_LENGTH](#)

The total length of all rows stored in this partition or subpartition, in bytes; that is, the total number of bytes stored in the partition or subpartition.

For `NDB` tables, you can also obtain this information using the `ndb_desc` utility.

- [MAX\\_DATA\\_LENGTH](#)

The maximum number of bytes that can be stored in this partition or subpartition.

For `NDB` tables, you can also obtain this information using the `ndb_desc` utility.

- [INDEX\\_LENGTH](#)

The length of the index file for this partition or subpartition, in bytes.

For partitions of `NDB` tables, whether the tables use implicit or explicit partitioning, the `INDEX_LENGTH` column value is always 0. However, you can obtain equivalent information using the `ndb_desc` utility.

- [DATA\\_FREE](#)

The number of bytes allocated to the partition or subpartition but not used.

For `NDB` tables, you can also obtain this information using the `ndb_desc` utility.

- [CREATE\\_TIME](#)

The time that the partition or subpartition was created.

- [UPDATE\\_TIME](#)

The time that the partition or subpartition was last modified.

- [CHECK\\_TIME](#)

The last time that the table to which this partition or subpartition belongs was checked.

For partitioned InnoDB tables, the value is always `NULL`.

- `CHECKSUM`

The checksum value, if any; otherwise `NULL`.

- `PARTITION_COMMENT`

The text of the comment, if the partition has one. If not, this value is empty.

The maximum length for a partition comment is defined as 1024 characters, and the display width of the `PARTITION_COMMENT` column is also 1024, characters to match this limit.

- `NODEGROUP`

This is the nodegroup to which the partition belongs. For NDB Cluster tables, this is always `default`. For partitioned tables using storage engines other than NDB, the value is also `default`. Otherwise, this column is empty.

- `TABLESPACE_NAME`

The name of the tablespace to which the partition belongs. The value is always `DEFAULT`, unless the table uses the NDB storage engine (see the *Notes* at the end of this section).

## Notes

- `PARTITIONS` is a nonstandard INFORMATION\_SCHEMA table.
- A table using any storage engine other than NDB and which is not partitioned has one row in the `PARTITIONS` table. However, the values of the `PARTITION_NAME`, `SUBPARTITION_NAME`, `PARTITION_ORDINAL_POSITION`, `SUBPARTITION_ORDINAL_POSITION`, `PARTITION_METHOD`, `SUBPARTITION_METHOD`, `PARTITION_EXPRESSION`, `SUBPARTITION_EXPRESSION`, and `PARTITION_DESCRIPTION` columns are all `NULL`. Also, the `PARTITION_COMMENT` column in this case is blank.
- An NDB table which is not explicitly partitioned has one row in the `PARTITIONS` table for each data node in the NDB cluster. For each such row:
  - The `SUBPARTITION_NAME`, `SUBPARTITION_ORDINAL_POSITION`, `SUBPARTITION_METHOD`, `PARTITION_EXPRESSION`, `SUBPARTITION_EXPRESSION`, `CREATE_TIME`, `UPDATE_TIME`, `CHECK_TIME`, `CHECKSUM`, and `TABLESPACE_NAME` columns are all `NULL`.
  - The `PARTITION_METHOD` is always `AUTO`.
  - The `NODEGROUP` column is `default`.
  - The `PARTITION_COMMENT` column is empty.

## 28.3.22 The INFORMATION\_SCHEMA PLUGINS Table

The `PLUGINS` table provides information about server plugins.

The `PLUGINS` table has these columns:

- `PLUGIN_NAME`

The name used to refer to the plugin in statements such as `INSTALL PLUGIN` and `UNINSTALL PLUGIN`.

- `PLUGIN_VERSION`

The version from the plugin's general type descriptor.

- `PLUGIN_STATUS`

The plugin status, one of `ACTIVE`, `INACTIVE`, `DISABLED`, `DELETING`, or `DELETED`.

- `PLUGIN_TYPE`

The type of plugin, such as `STORAGE ENGINE`, `INFORMATION_SCHEMA`, or `AUTHENTICATION`.

- `PLUGIN_TYPE_VERSION`

The version from the plugin's type-specific descriptor.

- `PLUGIN_LIBRARY`

The name of the plugin shared library file. This is the name used to refer to the plugin file in statements such as `INSTALL PLUGIN` and `UNINSTALL PLUGIN`. This file is located in the directory named by the `plugin_dir` system variable. If the library name is `NULL`, the plugin is compiled in and cannot be uninstalled with `UNINSTALL PLUGIN`.

- `PLUGIN_LIBRARY_VERSION`

The plugin API interface version.

- `PLUGIN_AUTHOR`

The plugin author.

- `PLUGIN_DESCRIPTION`

A short description of the plugin.

- `PLUGIN_LICENSE`

How the plugin is licensed (for example, `GPL`).

- `LOAD_OPTION`

How the plugin was loaded. The value is `OFF`, `ON`, `FORCE`, or `FORCE_PLUS_PERMANENT`. See [Section 7.6.1, “Installing and Uninstalling Plugins”](#).

## Notes

- `PLUGINS` is a nonstandard `INFORMATION_SCHEMA` table.
- For plugins installed with `INSTALL PLUGIN`, the `PLUGIN_NAME` and `PLUGIN_LIBRARY` values are also registered in the `mysql.plugin` table.
- For information about plugin data structures that form the basis of the information in the `PLUGINS` table, see [The MySQL Plugin API](#).

Plugin information is also available from the `SHOW PLUGINS` statement. See [Section 15.7.7.27, “SHOW PLUGINS Statement”](#). These statements are equivalent:

```
SELECT
 PLUGIN_NAME, PLUGIN_STATUS, PLUGIN_TYPE,
 PLUGIN_LIBRARY, PLUGIN_LICENSE
FROM INFORMATION_SCHEMA.PLUGINS;

SHOW PLUGINS;
```

## 28.3.23 The INFORMATION\_SCHEMA PROCESSLIST Table

**Important**

`INFORMATION_SCHEMA.PROCESSLIST` is deprecated and subject to removal in a future MySQL release. As such, the implementation of `SHOW PROCESSLIST` which uses this table is also deprecated. It is recommended to use the Performance Schema implementation of `PROCESSLIST` instead.

The MySQL process list indicates the operations currently being performed by the set of threads executing within the server. The `PROCESSLIST` table is one source of process information. For a comparison of this table with other sources, see [Sources of Process Information](#).

The `PROCESSLIST` table has these columns:

- `ID`

The connection identifier. This is the same value displayed in the `Id` column of the `SHOW PROCESSLIST` statement, displayed in the `PROCESSLIST_ID` column of the Performance Schema `threads` table, and returned by the `CONNECTION_ID()` function within the thread.

- `USER`

The MySQL user who issued the statement. A value of `system user` refers to a nonclient thread spawned by the server to handle tasks internally, for example, a delayed-row handler thread or an I/O or SQL thread used on replica hosts. For `system user`, there is no host specified in the `Host` column. `unauthenticated user` refers to a thread that has become associated with a client connection but for which authentication of the client user has not yet occurred. `event_scheduler` refers to the thread that monitors scheduled events (see [Section 27.4, “Using the Event Scheduler”](#)).

**Note**

A `USER` value of `system user` is distinct from the `SYSTEM_USER` privilege. The former designates internal threads. The latter distinguishes the system user and regular user account categories (see [Section 8.2.11, “Account Categories”](#)).

- `HOST`

The host name of the client issuing the statement (except for `system user`, for which there is no host). The host name for TCP/IP connections is reported in `host_name:client_port` format to make it easier to determine which client is doing what.

- `DB`

The default database for the thread, or `NULL` if none has been selected.

- `COMMAND`

The type of command the thread is executing on behalf of the client, or `Sleep` if the session is idle. For descriptions of thread commands, see [Section 10.14, “Examining Server Thread \(Process\) Information”](#). The value of this column corresponds to the `COM_xxx` commands of the client/server protocol and `Com_xxx` status variables. See [Section 7.1.10, “Server Status Variables”](#).

- `TIME`

The time in seconds that the thread has been in its current state. For a replica SQL thread, the value is the number of seconds between the timestamp of the last replicated event and the real time of the replica host. See [Section 19.2.3, “Replication Threads”](#).

- `STATE`

An action, event, or state that indicates what the thread is doing. For descriptions of `STATE` values, see [Section 10.14, “Examining Server Thread \(Process\) Information”](#).

Most states correspond to very quick operations. If a thread stays in a given state for many seconds, there might be a problem that needs to be investigated.

- [INFO](#)

The statement the thread is executing, or `NULL` if it is executing no statement. The statement might be the one sent to the server, or an innermost statement if the statement executes other statements. For example, if a `CALL` statement executes a stored procedure that is executing a `SELECT` statement, the `INFO` value shows the `SELECT` statement.

## Notes

- `PROCESSLIST` is a nonstandard [INFORMATION\\_SCHEMA](#) table.
- Like the output from the `SHOW PROCESSLIST` statement, the `PROCESSLIST` table provides information about all threads, even those belonging to other users, if you have the `PROCESS` privilege. Otherwise (without the `PROCESS` privilege), nonanonymous users have access to information about their own threads but not threads for other users, and anonymous users have no access to thread information.
- If an SQL statement refers to the `PROCESSLIST` table, MySQL populates the entire table once, when statement execution begins, so there is read consistency during the statement. There is no read consistency for a multi-statement transaction.

The following statements are equivalent:

```
SELECT * FROM INFORMATION_SCHEMA.PROCESSLIST
SHOW FULL PROCESSLIST
```

You can obtain information about use of this table by checking the values of the server status variables `Deprecated_use_i_s_processlist_count` and `Deprecated_use_i_s_processlist_last_timestamp`.

`Deprecated_use_i_s_processlist_count` shows the number of times the `PROCESSLIST` table has been accessed since the last server restart;

`Deprecated_use_i_s_processlist_last_timestamp` provides the last time the table was accessed, as a Unix timestamp.

### 28.3.24 The INFORMATION\_SCHEMA PROFILING Table

The `PROFILING` table provides statement profiling information. Its contents correspond to the information produced by the `SHOW PROFILE` and `SHOW PROFILES` statements (see [Section 15.7.7.32, “SHOW PROFILE Statement”](#)). The table is empty unless the `profiling` session variable is set to 1.

#### Note

This table is deprecated; expect it to be removed in a future MySQL release. Use the [Performance Schema](#) instead; see [Section 29.19.1, “Query Profiling Using Performance Schema”](#).

The `PROFILING` table has these columns:

- `QUERY_ID`

A numeric statement identifier.

- `SEQ`

A sequence number indicating the display order for rows with the same `QUERY_ID` value.

- `STATE`

The profiling state to which the row measurements apply.

- [DURATION](#)

How long statement execution remained in the given state, in seconds.

- [CPU\\_USER](#), [CPU\\_SYSTEM](#)

User and system CPU use, in seconds.

- [CONTEXT\\_VOLUNTARY](#), [CONTEXT\\_INVOLUNTARY](#)

How many voluntary and involuntary context switches occurred.

- [BLOCK\\_OPS\\_IN](#), [BLOCK\\_OPS\\_OUT](#)

The number of block input and output operations.

- [MESSAGES\\_SENT](#), [MESSAGES\\_RECEIVED](#)

The number of communication messages sent and received.

- [PAGEFAULTS\\_MAJOR](#), [PAGEFAULTS\\_MINOR](#)

The number of major and minor page faults.

- [SWAPS](#)

How many swaps occurred.

- [SOURCE\\_FUNCTION](#), [SOURCE\\_FILE](#), and [SOURCE\\_LINE](#)

Information indicating where in the source code the profiled state executes.

## Notes

- [PROFILING](#) is a nonstandard [INFORMATION\\_SCHEMA](#) table.

Profiling information is also available from the [SHOW PROFILE](#) and [SHOW PROFILES](#) statements. See [Section 15.7.7.32, “SHOW PROFILE Statement”](#). For example, the following queries are equivalent:

```
SHOW PROFILE FOR QUERY 2;

SELECT STATE, FORMAT(DURATION, 6) AS DURATION
FROM INFORMATION_SCHEMA.PROFILING
WHERE QUERY_ID = 2 ORDER BY SEQ;
```

## 28.3.25 The INFORMATION\_SCHEMA REFERENTIAL\_CONSTRAINTS Table

The [REFERENTIAL\\_CONSTRAINTS](#) table provides information about foreign keys.

The [REFERENTIAL\\_CONSTRAINTS](#) table has these columns:

- [CONSTRAINT\\_CATALOG](#)

The name of the catalog to which the constraint belongs. This value is always [def](#).

- [CONSTRAINT\\_SCHEMA](#)

The name of the schema (database) to which the constraint belongs.

- [CONSTRAINT\\_NAME](#)

The name of the constraint.

- [UNIQUE\\_CONSTRAINT\\_CATALOG](#)

The name of the catalog containing the unique constraint that the constraint references. This value is always [def](#).

- [UNIQUE\\_CONSTRAINT\\_SCHEMA](#)

The name of the schema containing the unique constraint that the constraint references.

- [UNIQUE\\_CONSTRAINT\\_NAME](#)

The name of the unique constraint that the constraint references.

- [MATCH\\_OPTION](#)

The value of the constraint [MATCH](#) attribute. The only valid value at this time is [NONE](#).

- [UPDATE\\_RULE](#)

The value of the constraint [ON UPDATE](#) attribute. The possible values are [CASCADE](#), [SET NULL](#), [SET DEFAULT](#), [RESTRICT](#), [NO ACTION](#).

- [DELETE\\_RULE](#)

The value of the constraint [ON DELETE](#) attribute. The possible values are [CASCADE](#), [SET NULL](#), [SET DEFAULT](#), [RESTRICT](#), [NO ACTION](#).

- [TABLE\\_NAME](#)

The name of the table. This value is the same as in the [TABLE\\_CONSTRAINTS](#) table.

- [REFERENCED\\_TABLE\\_NAME](#)

The name of the table referenced by the constraint.

### 28.3.26 The INFORMATION\_SCHEMA RESOURCE\_GROUPS Table

The [RESOURCE\\_GROUPS](#) table provides access to information about resource groups. For general discussion of the resource group capability, see [Section 7.1.16, “Resource Groups”](#).

You can see information only for columns for which you have some privilege.

The [RESOURCE\\_GROUPS](#) table has these columns:

- [RESOURCE\\_GROUP\\_NAME](#)

The name of the resource group.

- [RESOURCE\\_GROUP\\_TYPE](#)

The resource group type, either [SYSTEM](#) or [USER](#).

- [RESOURCE\\_GROUP\\_ENABLED](#)

Whether the resource group is enabled (1) or disabled (0);

- [VCPU\\_IDS](#)

The CPU affinity; that is, the set of virtual CPUs that the resource group can use. The value is a list of comma-separated CPU numbers or ranges.

- [THREAD\\_PRIORITY](#)

The priority for threads assigned to the resource group. The priority ranges from -20 (highest priority) to 19 (lowest priority). System resource groups have a priority that ranges from -20 to 0. User resource groups have a priority that ranges from 0 to 19.

### 28.3.27 The INFORMATION\_SCHEMA ROLE\_COLUMN\_GRANTS Table

The [ROLE\\_COLUMN\\_GRANTS](#) table provides information about the column privileges for roles that are available to or granted by the currently enabled roles.

The [ROLE\\_COLUMN\\_GRANTS](#) table has these columns:

- [GRANTOR](#)

The user name part of the account that granted the role.

- [GRANTOR\\_HOST](#)

The host name part of the account that granted the role.

- [GRANTEE](#)

The user name part of the account to which the role is granted.

- [GRANTEE\\_HOST](#)

The host name part of the account to which the role is granted.

- [TABLE\\_CATALOG](#)

The name of the catalog to which the role applies. This value is always [def](#).

- [TABLE\\_SCHEMA](#)

The name of the schema (database) to which the role applies.

- [TABLE\\_NAME](#)

The name of the table to which the role applies.

- [COLUMN\\_NAME](#)

The name of the column to which the role applies.

- [PRIVILEGE\\_TYPE](#)

The privilege granted. The value can be any privilege that can be granted at the column level; see [Section 15.7.1.6, “GRANT Statement”](#). Each row lists a single privilege, so there is one row per column privilege held by the grantee.

- [IS\\_GRANTABLE](#)

[YES](#) or [NO](#), depending on whether the role is grantable to other accounts.

### 28.3.28 The INFORMATION\_SCHEMA ROLE\_ROUTINE\_GRANTS Table

The [ROLE\\_ROUTINE\\_GRANTS](#) table provides information about the routine privileges for roles that are available to or granted by the currently enabled roles.

The [ROLE\\_ROUTINE\\_GRANTS](#) table has these columns:

- [GRANTOR](#)

The user name part of the account that granted the role.

- [GRANTOR](#)

The host name part of the account that granted the role.

- [GRANTOR\\_HOST](#)

The user name part of the account to which the role is granted.

- [GRANTEE](#)

The host name part of the account to which the role is granted.

- [GRANTEE\\_HOST](#)

The name of the catalog to which the routine belongs. This value is always [def](#).

- [SPECIFIC\\_CATALOG](#)

The name of the schema (database) to which the routine belongs.

- [SPECIFIC\\_SCHEMA](#)

The name of the routine.

- [ROUTINE\\_CATALOG](#)

The name of the catalog to which the routine belongs. This value is always [def](#).

- [ROUTINE\\_SCHEMA](#)

The name of the schema (database) to which the routine belongs.

- [ROUTINE\\_NAME](#)

The name of the routine.

- [PRIVILEGE\\_TYPE](#)

The privilege granted. The value can be any privilege that can be granted at the routine level; see [Section 15.7.1.6, “GRANT Statement”](#). Each row lists a single privilege, so there is one row per column privilege held by the grantee.

- [IS\\_GRANTABLE](#)

[YES](#) or [NO](#), depending on whether the role is grantable to other accounts.

### 28.3.29 The INFORMATION\_SCHEMA ROLE\_TABLE\_GRANTS Table

The [ROLE\\_TABLE\\_GRANTS](#) table provides information about the table privileges for roles that are available to or granted by the currently enabled roles.

The [ROLE\\_TABLE\\_GRANTS](#) table has these columns:

- [GRANTOR](#)

The user name part of the account that granted the role.

- [GRANTOR\\_HOST](#)

The host name part of the account that granted the role.

- **GRANTEE**

The user name part of the account to which the role is granted.

- **GRANTEE\_HOST**

The host name part of the account to which the role is granted.

- **TABLE\_CATALOG**

The name of the catalog to which the role applies. This value is always **def**.

- **TABLE\_SCHEMA**

The name of the schema (database) to which the role applies.

- **TABLE\_NAME**

The name of the table to which the role applies.

- **PRIVILEGE\_TYPE**

The privilege granted. The value can be any privilege that can be granted at the table level; see [Section 15.7.1.6, “GRANT Statement”](#). Each row lists a single privilege, so there is one row per column privilege held by the grantee.

- **IS\_GRANTABLE**

**YES** or **NO**, depending on whether the role is grantable to other accounts.

### 28.3.30 The INFORMATION\_SCHEMA ROUTINES Table

The **ROUTINES** table provides information about stored routines (stored procedures and stored functions). The **ROUTINES** table does not include built-in (native) functions or loadable functions.

The **ROUTINES** table has these columns:

- **SPECIFIC\_NAME**

The name of the routine.

- **ROUTINE\_CATALOG**

The name of the catalog to which the routine belongs. This value is always **def**.

- **ROUTINE\_SCHEMA**

The name of the schema (database) to which the routine belongs.

- **ROUTINE\_NAME**

The name of the routine.

- **ROUTINE\_TYPE**

**PROCEDURE** for stored procedures, **FUNCTION** for stored functions.

- **DATA\_TYPE**

If the routine is a stored function, the return value data type. If the routine is a stored procedure, this value is empty.

The **DATA\_TYPE** value is the type name only with no other information. The **DTD\_IDENTIFIER** value contains the type name and possibly other information such as the precision or length.

- [CHARACTER\\_MAXIMUM\\_LENGTH](#)

For stored function string return values, the maximum length in characters. If the routine is a stored procedure, this value is [NULL](#).

- [CHARACTER\\_OCTET\\_LENGTH](#)

For stored function string return values, the maximum length in bytes. If the routine is a stored procedure, this value is [NULL](#).

- [NUMERIC\\_PRECISION](#)

For stored function numeric return values, the numeric precision. If the routine is a stored procedure, this value is [NULL](#).

- [NUMERIC\\_SCALE](#)

For stored function numeric return values, the numeric scale. If the routine is a stored procedure, this value is [NULL](#).

- [DATETIME\\_PRECISION](#)

For stored function temporal return values, the fractional seconds precision. If the routine is a stored procedure, this value is [NULL](#).

- [CHARACTER\\_SET\\_NAME](#)

For stored function character string return values, the character set name. If the routine is a stored procedure, this value is [NULL](#).

- [COLLATION\\_NAME](#)

For stored function character string return values, the collation name. If the routine is a stored procedure, this value is [NULL](#).

- [DTD\\_IDENTIFIER](#)

If the routine is a stored function, the return value data type. If the routine is a stored procedure, this value is empty.

The [DATA\\_TYPE](#) value is the type name only with no other information. The [DTD\\_IDENTIFIER](#) value contains the type name and possibly other information such as the precision or length.

- [ROUTINE\\_BODY](#)

The language used for the routine definition. This value is always [SQL](#).

- [ROUTINE\\_DEFINITION](#)

The text of the SQL statement executed by the routine.

- [EXTERNAL\\_NAME](#)

This value is always [NULL](#).

- [EXTERNAL\\_LANGUAGE](#)

The language of the stored routine. The value is read from the [external\\_language](#) column of the [mysql.routines](#) data dictionary table.

- [PARAMETER\\_STYLE](#)

This value is always [SQL](#).

- [IS\\_DETERMINISTIC](#)

[YES](#) or [NO](#), depending on whether the routine is defined with the [DETERMINISTIC](#) characteristic.

- [SQL\\_DATA\\_ACCESS](#)

The data access characteristic for the routine. The value is one of [CONTAINS SQL](#), [NO SQL](#), [READS SQL DATA](#), or [MODIFIES SQL DATA](#).

- [SQL\\_PATH](#)

This value is always [NULL](#).

- [SECURITY\\_TYPE](#)

The routine [SQL SECURITY](#) characteristic. The value is one of [DEFINER](#) or [INVOKER](#).

- [CREATED](#)

The date and time when the routine was created. This is a [TIMESTAMP](#) value.

- [LAST\\_ALTERED](#)

The date and time when the routine was last modified. This is a [TIMESTAMP](#) value. If the routine has not been modified since its creation, this value is the same as the [CREATED](#) value.

- [SQL\\_MODE](#)

The SQL mode in effect when the routine was created or altered, and under which the routine executes. For the permitted values, see [Section 7.1.11, “Server SQL Modes”](#).

- [ROUTINE\\_COMMENT](#)

The text of the comment, if the routine has one. If not, this value is empty.

- [DEFINER](#)

The account named in the [DEFINER](#) clause (often the user who created the routine), in ['user\\_name'@'host\\_name'](#) format.

- [CHARACTER\\_SET\\_CLIENT](#)

The session value of the [character\\_set\\_client](#) system variable when the routine was created.

- [COLLATION\\_CONNECTION](#)

The session value of the [collation\\_connection](#) system variable when the routine was created.

- [DATABASE\\_COLLATION](#)

The collation of the database with which the routine is associated.

## Notes

- To see information about a routine, you must be the user named as the routine [DEFINER](#), have the [SHOW\\_ROUTINE](#) privilege, have the [SELECT](#) privilege at the global level, or have the [CREATE ROUTINE](#), [ALTER ROUTINE](#), or [EXECUTE](#) privilege granted at a scope that includes the routine. The [ROUTINE\\_DEFINITION](#) column is [NULL](#) if you have only [CREATE ROUTINE](#), [ALTER ROUTINE](#), or [EXECUTE](#).
- Information about stored function return values is also available in the [PARAMETERS](#) table. The return value row for a stored function can be identified as the row that has an [ORDINAL\\_POSITION](#) value of 0.

### 28.3.31 The INFORMATION\_SCHEMA SCHEMATA Table

A schema is a database, so the `SCHEMATA` table provides information about databases.

The `SCHEMATA` table has these columns:

- `CATALOG_NAME`

The name of the catalog to which the schema belongs. This value is always `def`.

- `SCHEMA_NAME`

The name of the schema.

- `DEFAULT_CHARACTER_SET_NAME`

The schema default character set.

- `DEFAULT_COLLATION_NAME`

The schema default collation.

- `SQL_PATH`

This value is always `NULL`.

- `DEFAULT_ENCRYPTION`

The schema default encryption.

Schema names are also available from the `SHOW DATABASES` statement. See [Section 15.7.7.15, "SHOW DATABASES Statement"](#). The following statements are equivalent:

```
SELECT SCHEMA_NAME AS `Database`
 FROM INFORMATION_SCHEMA.SCHEMATA
 [WHERE SCHEMA_NAME LIKE 'wild']

SHOW DATABASES
 [LIKE 'wild']
```

You see only those databases for which you have some kind of privilege, unless you have the global `SHOW DATABASES` privilege.

#### Caution

Because any static global privilege is considered a privilege for all databases, any static global privilege enables a user to see all database names with `SHOW DATABASES` or by examining the `SCHEMATA` table of `INFORMATION_SCHEMA`, except databases that have been restricted at the database level by partial revokes.

#### Notes

- The `SCHEMATA_EXTENSIONS` table augments the `SCHEMATA` table with information about schema options.

### 28.3.32 The INFORMATION\_SCHEMA SCHEMATA\_EXTENSIONS Table

The `SCHEMATA_EXTENSIONS` table augments the `SCHEMATA` table with information about schema options.

The `SCHEMATA_EXTENSIONS` table has these columns:

- `CATALOG_NAME`

The name of the catalog to which the schema belongs. This value is always `def`.

- `SCHEMA_NAME`

The name of the schema.

- `OPTIONS`

The options for the schema. If the schema is read only, the value contains `READ ONLY=1`. If the schema is not read only, no `READ ONLY` option appears.

## Example

```
mysql> ALTER SCHEMA mydb READ ONLY = 1;
mysql> SELECT * FROM INFORMATION_SCHEMA.SCHEMATA_EXTENSIONS
 WHERE SCHEMA_NAME = 'mydb';
+-----+-----+-----+
| CATALOG_NAME | SCHEMA_NAME | OPTIONS |
+-----+-----+-----+
| def | mydb | READ ONLY=1 |
+-----+-----+-----+
mysql> ALTER SCHEMA mydb READ ONLY = 0;
mysql> SELECT * FROM INFORMATION_SCHEMA.SCHEMATA_EXTENSIONS
 WHERE SCHEMA_NAME = 'mydb';
+-----+-----+-----+
| CATALOG_NAME | SCHEMA_NAME | OPTIONS |
+-----+-----+-----+
| def | mydb | |
+-----+-----+-----+
```

## Notes

- `SCHEMATA_EXTENSIONS` is a nonstandard `INFORMATION_SCHEMA` table.

### 28.3.33 The INFORMATION\_SCHEMA SCHEMA\_PRIVILEGES Table

The `SCHEMA_PRIVILEGES` table provides information about schema (database) privileges. It takes its values from the `mysql.db` system table.

The `SCHEMA_PRIVILEGES` table has these columns:

- `GRANTEE`

The name of the account to which the privilege is granted, in '`user_name`'@'`host_name`' format.

- `TABLE_CATALOG`

The name of the catalog to which the schema belongs. This value is always `def`.

- `TABLE_SCHEMA`

The name of the schema.

- `PRIVILEGE_TYPE`

The privilege granted. The value can be any privilege that can be granted at the schema level; see [Section 15.7.1.6, “GRANT Statement”](#). Each row lists a single privilege, so there is one row per schema privilege held by the grantee.

- `IS_GRANTABLE`

`YES` if the user has the `GRANT OPTION` privilege, `NO` otherwise. The output does not list `GRANT OPTION` as a separate row with `PRIVILEGE_TYPE='GRANT OPTION'`.

## Notes

- `SCHEMA_PRIVILEGES` is a nonstandard `INFORMATION_SCHEMA` table.

The following statements are *not* equivalent:

```
SELECT ... FROM INFORMATION_SCHEMA.SCHEMA_PRIVILEGES
SHOW GRANTS ...
```

### 28.3.34 The INFORMATION\_SCHEMA STATISTICS Table

The `STATISTICS` table provides information about table indexes.

Columns in `STATISTICS` that represent table statistics hold cached values. The `information_schema_stats_expiry` system variable defines the period of time before cached table statistics expire. The default is 86400 seconds (24 hours). If there are no cached statistics or statistics have expired, statistics are retrieved from storage engines when querying table statistics columns. To update cached values at any time for a given table, use `ANALYZE TABLE`. To always retrieve the latest statistics directly from storage engines, set `information_schema_stats_expiry=0`. For more information, see [Section 10.2.3, “Optimizing INFORMATION\\_SCHEMA Queries”](#).

#### Note

If the `innodb_read_only` system variable is enabled, `ANALYZE TABLE` may fail because it cannot update statistics tables in the data dictionary, which use `InnoDB`. For `ANALYZE TABLE` operations that update the key distribution, failure may occur even if the operation updates the table itself (for example, if it is a `MyISAM` table). To obtain the updated distribution statistics, set `information_schema_stats_expiry=0`.

The `STATISTICS` table has these columns:

- `TABLE_CATALOG`

The name of the catalog to which the table containing the index belongs. This value is always `def`.

- `TABLE_SCHEMA`

The name of the schema (database) to which the table containing the index belongs.

- `TABLE_NAME`

The name of the table containing the index.

- `NON_UNIQUE`

0 if the index cannot contain duplicates, 1 if it can.

- `INDEX_SCHEMA`

The name of the schema (database) to which the index belongs.

- `INDEX_NAME`

The name of the index. If the index is the primary key, the name is always `PRIMARY`.

- `SEQ_IN_INDEX`

The column sequence number in the index, starting with 1.

- `COLUMN_NAME`

The column name. See also the description for the [EXPRESSION](#) column.

- [COLLATION](#)

How the column is sorted in the index. This can have values [A](#) (ascending), [D](#) (descending), or [NULL](#) (not sorted).

- [CARDINALITY](#)

An estimate of the number of unique values in the index. To update this number, run [ANALYZE TABLE](#) or (for [MyISAM](#) tables) `myisamchk -a`.

[CARDINALITY](#) is counted based on statistics stored as integers, so the value is not necessarily exact even for small tables. The higher the cardinality, the greater the chance that MySQL uses the index when doing joins.

- [SUB\\_PART](#)

The index prefix. That is, the number of indexed characters if the column is only partly indexed, [NULL](#) if the entire column is indexed.

**Note**

Prefix *limits* are measured in bytes. However, prefix *lengths* for index specifications in [CREATE TABLE](#), [ALTER TABLE](#), and [CREATE INDEX](#) statements are interpreted as number of characters for nonbinary string types ([CHAR](#), [VARCHAR](#), [TEXT](#)) and number of bytes for binary string types ([BINARY](#), [VARBINARY](#), [BLOB](#)). Take this into account when specifying a prefix length for a nonbinary string column that uses a multibyte character set.

For additional information about index prefixes, see [Section 10.3.5, “Column Indexes”](#), and [Section 15.1.15, “CREATE INDEX Statement”](#).

- [PACKED](#)

Indicates how the key is packed. [NULL](#) if it is not.

- [NULLABLE](#)

Contains [YES](#) if the column may contain [NULL](#) values and [NO](#) if not.

- [INDEX\\_TYPE](#)

The index method used ([BTREE](#), [FULLTEXT](#), [HASH](#), [RTREE](#)).

- [COMMENT](#)

Information about the index not described in its own column, such as [disabled](#) if the index is disabled.

- [INDEX\\_COMMENT](#)

Any comment provided for the index with a [COMMENT](#) attribute when the index was created.

- [IS\\_VISIBLE](#)

Whether the index is visible to the optimizer. See [Section 10.3.12, “Invisible Indexes”](#).

- [EXPRESSION](#)

MySQL supports functional key parts (see [Functional Key Parts](#)), which affects both the [COLUMN\\_NAME](#) and [EXPRESSION](#) columns:

- For a nonfunctional key part, `COLUMN_NAME` indicates the column indexed by the key part and `EXPRESSION` is `NULL`.
- For a functional key part, `COLUMN_NAME` column is `NULL` and `EXPRESSION` indicates the expression for the key part.

## Notes

- There is no standard `INFORMATION_SCHEMA` table for indexes. The MySQL column list is similar to what SQL Server 2000 returns for `sp_statistics`, except that `QUALIFIER` and `OWNER` are replaced with `CATALOG` and `SCHEMA`, respectively.

Information about table indexes is also available from the `SHOW INDEX` statement. See [Section 15.7.7.23, “SHOW INDEX Statement”](#). The following statements are equivalent:

```
SELECT * FROM INFORMATION_SCHEMA.STATISTICS
 WHERE table_name = 'tbl_name'
 AND table_schema = 'db_name'

SHOW INDEX
 FROM tbl_name
 FROM db_name
```

Information about generated invisible primary key columns is visible in this table by default. You can cause such information to be hidden by setting `show_gipk_in_create_table_and_information_schema = OFF`. For more information, see [Section 15.1.20.11, “Generated Invisible Primary Keys”](#).

## 28.3.35 The INFORMATION\_SCHEMA ST\_Geometry\_COLUMNS Table

The `ST_Geometry_COLUMNS` table provides information about table columns that store spatial data. This table is based on the SQL/MM (ISO/IEC 13249-3) standard, with extensions as noted. MySQL implements `ST_Geometry_COLUMNS` as a view on the `INFORMATION_SCHEMA COLUMNS` table.

The `ST_Geometry_COLUMNS` table has these columns:

- `TABLE_CATALOG`

The name of the catalog to which the table containing the column belongs. This value is always `def`.

- `TABLE_SCHEMA`

The name of the schema (database) to which the table containing the column belongs.

- `TABLE_NAME`

The name of the table containing the column.

- `COLUMN_NAME`

The name of the column.

- `SRS_NAME`

The spatial reference system (SRS) name.

- `SRS_ID`

The spatial reference system ID (SRID).

- `GEOMETRY_TYPE_NAME`

The column data type. Permitted values are: `geometry`, `point`, `linestring`, `polygon`, `multipoint`, `multilinestring`, `multipolygon`, `geometrycollection`. This column is a MySQL extension to the standard.

## 28.3.36 The INFORMATION\_SCHEMA ST\_SPATIAL\_REFERENCE\_SYSTEMS Table

The `ST_SPATIAL_REFERENCE_SYSTEMS` table provides information about available spatial reference systems (SRSs) for spatial data. This table is based on the SQL/MM (ISO/IEC 13249-3) standard.

Entries in the `ST_SPATIAL_REFERENCE_SYSTEMS` table are based on the [European Petroleum Survey Group](#) (EPSG) data set, except for SRID 0, which corresponds to a special SRS used in MySQL that represents an infinite flat Cartesian plane with no units assigned to its axes. For additional information about SRSs, see [Section 13.4.5, “Spatial Reference System Support”](#).

The `ST_SPATIAL_REFERENCE_SYSTEMS` table has these columns:

- `SRS_NAME`

The spatial reference system name. This value is unique.

- `SRS_ID`

The spatial reference system numeric ID. This value is unique.

`SRS_ID` values represent the same kind of values as the SRID of geometry values or passed as the SRID argument to spatial functions. SRID 0 (the unitless Cartesian plane) is special. It is always a legal spatial reference system ID and can be used in any computations on spatial data that depend on SRID values.

- `ORGANIZATION`

The name of the organization that defined the coordinate system on which the spatial reference system is based.

- `ORGANIZATION_COORDSYS_ID`

The numeric ID given to the spatial reference system by the organization that defined it.

- `DEFINITION`

The spatial reference system definition. `DEFINITION` values are WKT values, represented as specified in the [Open Geospatial Consortium document OGC 12-063r5](#).

SRS definition parsing occurs on demand when definitions are needed by GIS functions. Parsed definitions are stored in the data dictionary cache to enable reuse and avoid incurring parsing overhead for every statement that needs SRS information.

- `DESCRIPTION`

The spatial reference system description.

### Notes

- The `SRS_NAME`, `ORGANIZATION`, `ORGANIZATION_COORDSYS_ID`, and `DESCRIPTION` columns contain information that may be of interest to users, but they are not used by MySQL.

### Example

```
mysql> SELECT * FROM ST_SPATIAL_REFERENCE_SYSTEMS
 WHERE SRS_ID = 4326\G
***** 1. row *****
```

```

SRS_NAME: WGS 84
SRS_ID: 4326
ORGANIZATION: EPSG
ORGANIZATION_COORDSYS_ID: 4326
DEFINITION: GEOGCS["WGS 84",DATUM["World Geodetic System 1984",
SPHEROID["WGS 84",6378137,298.257223563,
AUTHORITY["EPSG","7030"]],AUTHORITY["EPSG","6326"]],
PRIMEM["Greenwich",0,AUTHORITY["EPSG","8901"]],
UNIT["degree",0.017453292519943278,
AUTHORITY["EPSG","9122"]],
AXIS["Lat",NORTH],AXIS["Long",EAST],
AUTHORITY["EPSG","4326"]]
DESCRIPTION:

```

This entry describes the SRS used for GPS systems. It has a name (`SRS_NAME`) of WGS 84 and an ID (`SRS_ID`) of 4326, which is the ID used by the [European Petroleum Survey Group \(EPSG\)](#).

The `DEFINITION` values for projected and geographic SRSs begin with `PROJCS` and `GEOGCS`, respectively. The definition for SRID 0 is special and has an empty `DEFINITION` value. The following query determines how many entries in the `ST_SPATIAL_REFERENCE_SYSTEMS` table correspond to projected, geographic, and other SRSs, based on `DEFINITION` values:

```

mysql> SELECT
 COUNT(*),
 CASE LEFT(DEFINITION, 6)
 WHEN 'PROJCS' THEN 'Projected'
 WHEN 'GEOGCS' THEN 'Geographic'
 ELSE 'Other'
 END AS SRS_TYPE
 FROM INFORMATION_SCHEMA.ST_SPATIAL_REFERENCE_SYSTEMS
 GROUP BY SRS_TYPE;
+-----+-----+
| COUNT(*) | SRS_TYPE |
+-----+-----+
| 1 | Other |
| 4668 | Projected |
| 483 | Geographic |
+-----+-----+

```

To enable manipulation of SRS entries stored in the data dictionary, MySQL provides these SQL statements:

- `CREATE SPATIAL REFERENCE SYSTEM`: See [Section 15.1.19, “CREATE SPATIAL REFERENCE SYSTEM Statement”](#). The description for this statement includes additional information about SRS components.
- `DROP SPATIAL REFERENCE SYSTEM`: See [Section 15.1.31, “DROP SPATIAL REFERENCE SYSTEM Statement”](#).

### 28.3.37 The INFORMATION\_SCHEMA ST\_UNITS\_OF\_MEASURE Table

The `ST_UNITS_OF_MEASURE` table provides information about acceptable units for the `ST_Distance()` function.

The `ST_UNITS_OF_MEASURE` table has these columns:

- `UNIT_NAME`

The name of the unit.

- `UNIT_TYPE`

The unit type (for example, `LINEAR`).

- `CONVERSION_FACTOR`

A conversion factor used for internal calculations.

- **DESCRIPTION**

A description of the unit.

### 28.3.38 The INFORMATION\_SCHEMA TABLES Table

The `TABLES` table provides information about tables in databases.

Columns in `TABLES` that represent table statistics hold cached values. The `information_schema_stats_expiry` system variable defines the period of time before cached table statistics expire. The default is 86400 seconds (24 hours). If there are no cached statistics or statistics have expired, statistics are retrieved from storage engines when querying table statistics columns. To update cached values at any time for a given table, use `ANALYZE TABLE`. To always retrieve the latest statistics directly from storage engines, set `information_schema_stats_expiry` to 0. For more information, see [Section 10.2.3, “Optimizing INFORMATION\\_SCHEMA Queries”](#).

#### Note

If the `innodb_read_only` system variable is enabled, `ANALYZE TABLE` may fail because it cannot update statistics tables in the data dictionary, which use InnoDB. For `ANALYZE TABLE` operations that update the key distribution, failure may occur even if the operation updates the table itself (for example, if it is a MyISAM table). To obtain the updated distribution statistics, set `information_schema_stats_expiry=0`.

The `TABLES` table has these columns:

- **TABLE\_CATALOG**

The name of the catalog to which the table belongs. This value is always `def`.

- **TABLE\_SCHEMA**

The name of the schema (database) to which the table belongs.

- **TABLE\_NAME**

The name of the table.

- **TABLE\_TYPE**

`BASE TABLE` for a table, `VIEW` for a view, or `SYSTEM VIEW` for an INFORMATION\_SCHEMA table.

The `TABLES` table does not list `TEMPORARY` tables.

- **ENGINE**

The storage engine for the table. See [Chapter 17, “The InnoDB Storage Engine”](#), and [Chapter 18, “Alternative Storage Engines”](#).

For partitioned tables, `ENGINE` shows the name of the storage engine used by all partitions.

- **VERSION**

This column is unused. With the removal of `.frm` files in MySQL 8.0, this column now reports a hardcoded value of 10, which is the last `.frm` file version used in MySQL 5.7.

- **ROW\_FORMAT**

The row-storage format (`Fixed`, `Dynamic`, `Compressed`, `Redundant`, `Compact`). For MyISAM tables, `Dynamic` corresponds to what `myisamchk -dvv` reports as `Packed`.

- **TABLE\_ROWS**

The number of rows. Some storage engines, such as [MyISAM](#), store the exact count. For other storage engines, such as [InnoDB](#), this value is an approximation, and may vary from the actual value by as much as 40% to 50%. In such cases, use `SELECT COUNT(*)` to obtain an accurate count.

`TABLE_ROWS` is `NULL` for [INFORMATION\\_SCHEMA](#) tables.

For [InnoDB](#) tables, the row count is only a rough estimate used in SQL optimization. (This is also true if the [InnoDB](#) table is partitioned.)

- [AVG\\_ROW\\_LENGTH](#)

The average row length.

- [DATA\\_LENGTH](#)

For [MyISAM](#), [DATA\\_LENGTH](#) is the length of the data file, in bytes.

For [InnoDB](#), [DATA\\_LENGTH](#) is the approximate amount of space allocated for the clustered index, in bytes. Specifically, it is the clustered index size, in pages, multiplied by the [InnoDB](#) page size.

Refer to the notes at the end of this section for information regarding other storage engines.

- [MAX\\_DATA\\_LENGTH](#)

For [MyISAM](#), [MAX\\_DATA\\_LENGTH](#) is maximum length of the data file. This is the total number of bytes of data that can be stored in the table, given the data pointer size used.

Unused for [InnoDB](#).

Refer to the notes at the end of this section for information regarding other storage engines.

- [INDEX\\_LENGTH](#)

For [MyISAM](#), [INDEX\\_LENGTH](#) is the length of the index file, in bytes.

For [InnoDB](#), [INDEX\\_LENGTH](#) is the approximate amount of space allocated for non-clustered indexes, in bytes. Specifically, it is the sum of non-clustered index sizes, in pages, multiplied by the [InnoDB](#) page size.

Refer to the notes at the end of this section for information regarding other storage engines.

- [DATA\\_FREE](#)

The number of allocated but unused bytes.

[InnoDB](#) tables report the free space of the tablespace to which the table belongs. For a table located in the shared tablespace, this is the free space of the shared tablespace. If you are using multiple tablespaces and the table has its own tablespace, the free space is for only that table. Free space means the number of bytes in completely free extents minus a safety margin. Even if free space displays as 0, it may be possible to insert rows as long as new extents need not be allocated.

For NDB Cluster, [DATA\\_FREE](#) shows the space allocated on disk for, but not used by, a Disk Data table or fragment on disk. (In-memory data resource usage is reported by the [DATA\\_LENGTH](#) column.)

For partitioned tables, this value is only an estimate and may not be absolutely correct. A more accurate method of obtaining this information in such cases is to query the [INFORMATION\\_SCHEMA PARTITIONS](#) table, as shown in this example:

```
SELECT SUM(DATA_FREE)
 FROM INFORMATION_SCHEMA.PARTITIONS
```

```
WHERE TABLE_SCHEMA = 'mydb'
AND TABLE_NAME = 'mytable';
```

For more information, see [Section 28.3.21, “The INFORMATION\\_SCHEMA PARTITIONS Table”](#).

- [AUTO\\_INCREMENT](#)

The next [AUTO\\_INCREMENT](#) value.

- [CREATE\\_TIME](#)

When the table was created.

- [UPDATE\\_TIME](#)

When the table was last updated. For some storage engines, this value is [NULL](#). Even with [file-per-table](#) mode with each [InnoDB](#) table in a separate [.ibd](#) file, [change buffering](#) can delay the write to the data file, so the file modification time is different from the time of the last insert, update, or delete. For [MyISAM](#), the data file timestamp is used; however, on Windows the timestamp is not updated by updates, so the value is inaccurate.

[UPDATE\\_TIME](#) displays a timestamp value for the last [UPDATE](#), [INSERT](#), or [DELETE](#) performed on [InnoDB](#) tables that are not partitioned. For MVCC, the timestamp value reflects the [COMMIT](#) time, which is considered the last update time. Timestamps are not persisted when the server is restarted or when the table is evicted from the [InnoDB](#) data dictionary cache.

- [CHECK\\_TIME](#)

When the table was last checked. Not all storage engines update this time, in which case, the value is always [NULL](#).

For partitioned [InnoDB](#) tables, [CHECK\\_TIME](#) is always [NULL](#).

- [TABLE\\_COLLATION](#)

The table default collation. The output does not explicitly list the table default character set, but the collation name begins with the character set name.

- [CHECKSUM](#)

The live checksum value, if any.

- [CREATE\\_OPTIONS](#)

Extra options used with [CREATE\\_TABLE](#).

[CREATE\\_OPTIONS](#) shows [partitioned](#) for a partitioned table.

[CREATE\\_OPTIONS](#) shows the [ENCRYPTION](#) clause specified for tables created in file-per-table tablespaces. It shows the encryption clause for file-per-table tablespaces if the table is encrypted or if the specified encryption differs from the schema encryption. The encryption clause is not shown for tables created in general tablespaces. To identify encrypted file-per-table and general tablespaces, query the [INNODB\\_TABLESPACES\\_ENCRYPTION](#) column.

When creating a table with [strict mode](#) disabled, the storage engine's default row format is used if the specified row format is not supported. The actual row format of the table is reported in the [ROW\\_FORMAT](#) column. [CREATE\\_OPTIONS](#) shows the row format that was specified in the [CREATE\\_TABLE](#) statement.

When altering the storage engine of a table, table options that are not applicable to the new storage engine are retained in the table definition to enable reverting the table with its previously defined options to the original storage engine, if necessary. The [CREATE\\_OPTIONS](#) column may show retained options.

- **TABLE\_COMMENT**

The comment used when creating the table (or information as to why MySQL could not access the table information).

## Notes

- For NDB tables, the output of this statement shows appropriate values for the `AVG_ROW_LENGTH` and `DATA_LENGTH` columns, with the exception that `BLOB` columns are not taken into account.
- For NDB tables, `DATA_LENGTH` includes data stored in main memory only; the `MAX_DATA_LENGTH` and `DATA_FREE` columns apply to Disk Data.
- For NDB Cluster Disk Data tables, `MAX_DATA_LENGTH` shows the space allocated for the disk part of a Disk Data table or fragment. (In-memory data resource usage is reported by the `DATA_LENGTH` column.)
- For MEMORY tables, the `DATA_LENGTH`, `MAX_DATA_LENGTH`, and `INDEX_LENGTH` values approximate the actual amount of allocated memory. The allocation algorithm reserves memory in large amounts to reduce the number of allocation operations.
- For views, most `TABLES` columns are 0 or `NULL` except that `TABLE_NAME` indicates the view name, `CREATE_TIME` indicates the creation time, and `TABLE_COMMENT` says `VIEW`.

Table information is also available from the `SHOW TABLE STATUS` and `SHOW TABLES` statements. See [Section 15.7.7.38, “SHOW TABLE STATUS Statement”](#), and [Section 15.7.7.39, “SHOW TABLES Statement”](#). The following statements are equivalent:

```
SELECT
 TABLE_NAME, ENGINE, VERSION, ROW_FORMAT, TABLE_ROWS, AVG_ROW_LENGTH,
 DATA_LENGTH, MAX_DATA_LENGTH, INDEX_LENGTH, DATA_FREE, AUTO_INCREMENT,
 CREATE_TIME, UPDATE_TIME, CHECK_TIME, TABLE_COLLATION, CHECKSUM,
 CREATE_OPTIONS, TABLE_COMMENT
FROM INFORMATION_SCHEMA.TABLES
WHERE table_schema = 'db_name'
[AND table_name LIKE 'wild']

SHOW TABLE STATUS
FROM db_name
[LIKE 'wild']
```

The following statements are equivalent:

```
SELECT
 TABLE_NAME, TABLE_TYPE
FROM INFORMATION_SCHEMA.TABLES
WHERE table_schema = 'db_name'
[AND table_name LIKE 'wild']

SHOW FULL TABLES
FROM db_name
[LIKE 'wild']
```

## 28.3.39 The INFORMATION\_SCHEMA TABLES\_EXTENSIONS Table

The `TABLES_EXTENSIONS` table provides information about table attributes defined for primary and secondary storage engines.

### Note

The `TABLES_EXTENSIONS` table is reserved for future use.

The `TABLES_EXTENSIONS` table has these columns:

- **TABLE\_CATALOG**

The name of the catalog to which the table belongs. This value is always `def`.

- `TABLE_SCHEMA`

The name of the schema (database) to which the table belongs.

- `TABLE_NAME`

The name of the table.

- `ENGINE_ATTRIBUTE`

Table attributes defined for the primary storage engine. Reserved for future use.

- `SECONDARY_ENGINE_ATTRIBUTE`

Table attributes defined for the secondary storage engine. Reserved for future use.

### 28.3.40 The INFORMATION\_SCHEMA TABLESPACES\_EXTENSIONS Table

The `TABLESPACES_EXTENSIONS` table provides information about tablespace attributes defined for primary storage engines.

#### Note

The `TABLESPACES_EXTENSIONS` table is reserved for future use.

The `TABLESPACES_EXTENSIONS` table has these columns:

- `TABLESPACE_NAME`

The name of the tablespace.

- `ENGINE_ATTRIBUTE`

Tablespace attributes defined for the primary storage engine. Reserved for future use.

### 28.3.41 The INFORMATION\_SCHEMA TABLE\_CONSTRAINTS Table

The `TABLE_CONSTRAINTS` table describes which tables have constraints.

The `TABLE_CONSTRAINTS` table has these columns:

- `CONSTRAINT_CATALOG`

The name of the catalog to which the constraint belongs. This value is always `def`.

- `CONSTRAINT_SCHEMA`

The name of the schema (database) to which the constraint belongs.

- `CONSTRAINT_NAME`

The name of the constraint.

- `TABLE_SCHEMA`

The name of the schema (database) to which the table belongs.

- `TABLE_NAME`

The name of the table.

- **CONSTRAINT\_TYPE**

The type of constraint. The value can be `UNIQUE`, `PRIMARY KEY`, `FOREIGN KEY` or `CHECK`. This is a `CHAR` (not `ENUM`) column.

The `UNIQUE` and `PRIMARY KEY` information is about the same as what you get from the `Key_name` column in the output from `SHOW INDEX` when the `Non_unique` column is `0`.

- **ENFORCED**

For `CHECK` constraints, the value is `YES` or `NO` to indicate whether the constraint is enforced. For other constraints, the value is always `YES`.

## 28.3.42 The INFORMATION\_SCHEMA TABLE\_CONSTRAINTS\_EXTENSIONS Table

The `TABLE_CONSTRAINTS_EXTENSIONS` table provides information about table constraint attributes defined for primary and secondary storage engines.

### Note

The `TABLE_CONSTRAINTS_EXTENSIONS` table is reserved for future use.

The `TABLE_CONSTRAINTS_EXTENSIONS` table has these columns:

- **CONSTRAINT\_CATALOG**

The name of the catalog to which the table belongs.

- **CONSTRAINT\_SCHEMA**

The name of the schema (database) to which the table belongs.

- **CONSTRAINT\_NAME**

The name of the constraint.

- **TABLE\_NAME**

The name of the table.

- **ENGINE\_ATTRIBUTE**

Constraint attributes defined for the primary storage engine. Reserved for future use.

- **SECONDARY\_ENGINE\_ATTRIBUTE**

Constraint attributes defined for the secondary storage engine. Reserved for future use.

## 28.3.43 The INFORMATION\_SCHEMA TABLE\_PRIVILEGES Table

The `TABLE_PRIVILEGES` table provides information about table privileges. It takes its values from the `mysql.tables_priv` system table.

The `TABLE_PRIVILEGES` table has these columns:

- **GRANTEE**

The name of the account to which the privilege is granted, in '`user_name`'@'`host_name`' format.

- **TABLE\_CATALOG**

The name of the catalog to which the table belongs. This value is always `def`.

- [TABLE\\_SCHEMA](#)

The name of the schema (database) to which the table belongs.

- [TABLE\\_NAME](#)

The name of the table.

- [PRIVILEGE\\_TYPE](#)

The privilege granted. The value can be any privilege that can be granted at the table level; see [Section 15.7.1.6, “GRANT Statement”](#). Each row lists a single privilege, so there is one row per table privilege held by the grantee.

- [IS\\_GRANTABLE](#)

`YES` if the user has the `GRANT OPTION` privilege, `NO` otherwise. The output does not list `GRANT OPTION` as a separate row with `PRIVILEGE_TYPE='GRANT OPTION'`.

## Notes

- [TABLE\\_PRIVILEGES](#) is a nonstandard [INFORMATION\\_SCHEMA](#) table.

The following statements are *not* equivalent:

```
SELECT ... FROM INFORMATION_SCHEMA.TABLE_PRIVILEGES
SHOW GRANTS ...
```

### 28.3.44 The INFORMATION\_SCHEMA TRIGGERS Table

The `TRIGGERS` table provides information about triggers. To see information about a table's triggers, you must have the `TRIGGER` privilege for the table.

The `TRIGGERS` table has these columns:

- [TRIGGER\\_CATALOG](#)

The name of the catalog to which the trigger belongs. This value is always `def`.

- [TRIGGER\\_SCHEMA](#)

The name of the schema (database) to which the trigger belongs.

- [TRIGGER\\_NAME](#)

The name of the trigger.

- [EVENT\\_MANIPULATION](#)

The trigger event. This is the type of operation on the associated table for which the trigger activates. The value is `INSERT` (a row was inserted), `DELETE` (a row was deleted), or `UPDATE` (a row was modified).

- [EVENT\\_OBJECT\\_CATALOG](#), [EVENT\\_OBJECT\\_SCHEMA](#), and [EVENT\\_OBJECT\\_TABLE](#)

As noted in [Section 27.3, “Using Triggers”](#), every trigger is associated with exactly one table. These columns indicate the catalog and schema (database) in which this table occurs, and the table name, respectively. The `EVENT_OBJECT_CATALOG` value is always `def`.

- [ACTION\\_ORDER](#)

The ordinal position of the trigger's action within the list of triggers on the same table with the same `EVENT_MANIPULATION` and `ACTION_TIMING` values.

- [ACTION\\_CONDITION](#)

This value is always `NULL`.

- [ACTION\\_STATEMENT](#)

The trigger body; that is, the statement executed when the trigger activates. This text uses UTF-8 encoding.

- [ACTION\\_ORIENTATION](#)

This value is always `ROW`.

- [ACTION\\_TIMING](#)

Whether the trigger activates before or after the triggering event. The value is `BEFORE` or `AFTER`.

- [ACTION\\_REFERENCE\\_OLD\\_TABLE](#)

This value is always `NULL`.

- [ACTION\\_REFERENCE\\_NEW\\_TABLE](#)

This value is always `NULL`.

- [ACTION\\_REFERENCE\\_OLD\\_ROW](#) and [ACTION\\_REFERENCE\\_NEW\\_ROW](#)

The old and new column identifiers, respectively. The `ACTION_REFERENCE_OLD_ROW` value is always `OLD` and the `ACTION_REFERENCE_NEW_ROW` value is always `NEW`.

- [CREATED](#)

The date and time when the trigger was created. This is a `TIMESTAMP(2)` value (with a fractional part in hundredths of seconds) for triggers.

- [SQL\\_MODE](#)

The SQL mode in effect when the trigger was created, and under which the trigger executes. For the permitted values, see [Section 7.1.11, “Server SQL Modes”](#).

- [DEFINER](#)

The account named in the `DEFINER` clause (often the user who created the trigger), in `'user_name'@'host_name'` format.

- [CHARACTER\\_SET\\_CLIENT](#)

The session value of the `character_set_client` system variable when the trigger was created.

- [COLLATION\\_CONNECTION](#)

The session value of the `collation_connection` system variable when the trigger was created.

- [DATABASE\\_COLLATION](#)

The collation of the database with which the trigger is associated.

## Example

The following example uses the `ins_sum` trigger defined in [Section 27.3, “Using Triggers”](#):

```
mysql> SELECT * FROM INFORMATION_SCHEMA.TRIGGERS
 WHERE TRIGGER_SCHEMA='test' AND TRIGGER_NAME='ins_sum'\G
***** 1. row *****
 TRIGGER_CATALOG: def
 TRIGGER_SCHEMA: test
```

```

 TRIGGER_NAME: ins_sum
EVENT_MANIPULATION: INSERT
EVENT_OBJECT_CATALOG: def
EVENT_OBJECT_SCHEMA: test
EVENT_OBJECT_TABLE: account
ACTION_ORDER: 1
ACTION_CONDITION: NULL
ACTION_STATEMENT: SET @sum = @sum + NEW.amount
ACTION_ORIENTATION: ROW
ACTION_TIMING: BEFORE
ACTION_REFERENCE_OLD_TABLE: NULL
ACTION_REFERENCE_NEW_TABLE: NULL
ACTION_REFERENCE_OLD_ROW: OLD
ACTION_REFERENCE_NEW_ROW: NEW
CREATED: 2018-08-08 10:10:12.61
SQL_MODE: ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES,
NO_ZERO_IN_DATE,NO_ZERO_DATE,
ERROR_FOR_DIVISION_BY_ZERO,
NO_ENGINE_SUBSTITUTION
DEFINER: me@localhost
CHARACTER_SET_CLIENT: utf8mb4
COLLATION_CONNECTION: utf8mb4_0900_ai_ci
DATABASE_COLLATION: utf8mb4_0900_ai_ci

```

Trigger information is also available from the `SHOW TRIGGERS` statement. See [Section 15.7.7.40, “SHOW TRIGGERS Statement”](#).

### 28.3.45 The INFORMATION\_SCHEMA USER\_ATTRIBUTES Table

The `USER_ATTRIBUTES` table provides information about user comments and user attributes. It takes its values from the `mysql.user` system table.

The `USER_ATTRIBUTES` table has these columns:

- `USER`

The user name portion of the account to which the `ATTRIBUTE` column value applies.

- `HOST`

The host name portion of the account to which the `ATTRIBUTE` column value applies.

- `ATTRIBUTE`

The user comment, user attribute, or both belonging to the account specified by the `USER` and `HOST` columns. The value is in JSON object notation. Attributes are shown exactly as set using `CREATE USER` and `ALTER USER` statements with `ATTRIBUTE` or `COMMENT` options. A comment is shown as a key-value pair having `comment` as the key. For additional information and examples, see [CREATE USER Comment and Attribute Options](#).

### Notes

- `USER_ATTRIBUTES` is a nonstandard `INFORMATION_SCHEMA` table.
- To obtain only the user comment for a given user as an unquoted string, you can employ a query such as this one:

```

mysql> SELECT ATTRIBUTE->>"$.comment" AS Comment
 -> FROM INFORMATION_SCHEMA.USER_ATTRIBUTES
 -> WHERE USER='bill' AND HOST='localhost';
+-----+
| Comment |
+-----+
| A comment |
+-----+

```

Similarly, you can obtain the unquoted value for a given user attribute using its key.

- `USER_ATTRIBUTES` contents are accessible as follows:
  - All rows are accessible if:
    - The current thread is a replica thread.
    - The access control system has not been initialized (for example, the server was started with the `--skip-grant-tables` option).
  - The currently authenticated account has the `UPDATE` or `SELECT` privilege for the `mysql.user` system table.
  - The currently authenticated account has the `CREATE USER` and `SYSTEM_USER` privileges.
- Otherwise, the currently authenticated account can see the row for that account. Additionally, if the account has the `CREATE USER` privilege but not the `SYSTEM_USER` privilege, it can see rows for all other accounts that do not have the `SYSTEM_USER` privilege.

For more information about specifying account comments and attributes, see [Section 15.7.1.3, “CREATE USER Statement”](#).

### 28.3.46 The INFORMATION\_SCHEMA USER\_PRIVILEGES Table

The `USER_PRIVILEGES` table provides information about global privileges. It takes its values from the `mysql.user` system table.

The `USER_PRIVILEGES` table has these columns:

- `GRANTEE`

The name of the account to which the privilege is granted, in '`user_name '@' host_name`' format.

- `TABLE_CATALOG`

The name of the catalog. This value is always `def`.

- `PRIVILEGE_TYPE`

The privilege granted. The value can be any privilege that can be granted at the global level; see [Section 15.7.1.6, “GRANT Statement”](#). Each row lists a single privilege, so there is one row per global privilege held by the grantee.

- `IS_GRANTABLE`

`YES` if the user has the `GRANT OPTION` privilege, `NO` otherwise. The output does not list `GRANT OPTION` as a separate row with `PRIVILEGE_TYPE='GRANT OPTION'`.

#### Notes

- `USER_PRIVILEGES` is a nonstandard `INFORMATION_SCHEMA` table.

The following statements are *not* equivalent:

```
SELECT ... FROM INFORMATION_SCHEMA.USER_PRIVILEGES
SHOW GRANTS ...
```

### 28.3.47 The INFORMATION\_SCHEMA VIEWS Table

The `VIEWS` table provides information about views in databases. You must have the `SHOW VIEW` privilege to access this table.

The `VIEWS` table has these columns:

## The INFORMATION\_SCHEMA VIEWS Table

---

- **TABLE\_CATALOG**

The name of the catalog to which the view belongs. This value is always `def`.

- **TABLE\_SCHEMA**

The name of the schema (database) to which the view belongs.

- **TABLE\_NAME**

The name of the view.

- **VIEW\_DEFINITION**

The `SELECT` statement that provides the definition of the view. This column has most of what you see in the `Create Table` column that `SHOW CREATE VIEW` produces. Skip the words before `SELECT` and skip the words `WITH CHECK OPTION`. Suppose that the original statement was:

```
CREATE VIEW v AS
 SELECT s2,s1 FROM t
 WHERE s1 > 5
 ORDER BY s1
 WITH CHECK OPTION;
```

Then the view definition looks like this:

```
SELECT s2,s1 FROM t WHERE s1 > 5 ORDER BY s1
```

- **CHECK\_OPTION**

The value of the `CHECK_OPTION` attribute. The value is one of `NONE`, `CASCADE`, or `LOCAL`.

- **IS\_UPDATABLE**

MySQL sets a flag, called the view updatability flag, at `CREATE VIEW` time. The flag is set to `YES` (true) if `UPDATE` and `DELETE` (and similar operations) are legal for the view. Otherwise, the flag is set to `NO` (false). The `IS_UPDATABLE` column in the `VIEWS` table displays the status of this flag. It means that the server always knows whether a view is updatable.

If a view is not updatable, statements such `UPDATE`, `DELETE`, and `INSERT` are illegal and are rejected. (Even if a view is updatable, it might not be possible to insert into it; for details, refer to [Section 27.5.3, “Updatable and Insertable Views”](#).)

- **DEFINER**

The account of the user who created the view, in '`user_name`'@'`host_name`' format.

- **SECURITY\_TYPE**

The view `SQL SECURITY` characteristic. The value is one of `DEFINER` or `INVOKER`.

- **CHARACTER\_SET\_CLIENT**

The session value of the `character_set_client` system variable when the view was created.

- **COLLATION\_CONNECTION**

The session value of the `collation_connection` system variable when the view was created.

## Notes

MySQL permits different `sql_mode` settings to tell the server the type of SQL syntax to support. For example, you might use the `ANSI` SQL mode to ensure MySQL correctly interprets the standard SQL concatenation operator, the double bar (`||`), in your queries. If you then create a view that

concatenates items, you might worry that changing the `sql_mode` setting to a value different from `ANSI` could cause the view to become invalid. But this is not the case. No matter how you write out a view definition, MySQL always stores it the same way, in a canonical form. Here is an example that shows how the server changes a double bar concatenation operator to a `CONCAT()` function:

```
mysql> SET sql_mode = 'ANSI';
Query OK, 0 rows affected (0.00 sec)

mysql> CREATE VIEW test.v AS SELECT 'a' || 'b' as coll1;
Query OK, 0 rows affected (0.00 sec)

mysql> SELECT VIEW_DEFINITION FROM INFORMATION_SCHEMA.VIEWS
 WHERE TABLE_SCHEMA = 'test' AND TABLE_NAME = 'v';
+-----+
| VIEW_DEFINITION |
+-----+
| select concat('a','b') AS `coll1` |
+-----+
1 row in set (0.00 sec)
```

The advantage of storing a view definition in canonical form is that changes made later to the value of `sql_mode` do not affect the results from the view. However, an additional consequence is that comments prior to `SELECT` are stripped from the definition by the server.

### 28.3.48 The INFORMATION\_SCHEMA VIEW\_ROUTINE\_USAGE Table

The `VIEW_ROUTINE_USAGE` table provides access to information about stored functions used in view definitions. The table does not list information about built-in (native) functions or loadable functions used in the definitions.

You can see information only for views for which you have some privilege, and only for functions for which you have some privilege.

The `VIEW_ROUTINE_USAGE` table has these columns:

- `TABLE_CATALOG`

The name of the catalog to which the view belongs. This value is always `def`.

- `TABLE_SCHEMA`

The name of the schema (database) to which the view belongs.

- `TABLE_NAME`

The name of the view.

- `SPECIFIC_CATALOG`

The name of the catalog to which the function used in the view definition belongs. This value is always `def`.

- `SPECIFIC_SCHEMA`

The name of the schema (database) to which the function used in the view definition belongs.

- `SPECIFIC_NAME`

The name of the function used in the view definition.

### 28.3.49 The INFORMATION\_SCHEMA VIEW\_TABLE\_USAGE Table

The `VIEW_TABLE_USAGE` table provides access to information about tables and views used in view definitions.

You can see information only for views for which you have some privilege, and only for tables for which you have some privilege.

The `VIEW_TABLE_USAGE` table has these columns:

- `VIEW_CATALOG`

The name of the catalog to which the view belongs. This value is always `def`.

- `VIEW_SCHEMA`

The name of the schema (database) to which the view belongs.

- `VIEW_NAME`

The name of the view.

- `TABLE_CATALOG`

The name of the catalog to which the table or view used in the view definition belongs. This value is always `def`.

- `TABLE_SCHEMA`

The name of the schema (database) to which the table or view used in the view definition belongs.

- `TABLE_NAME`

The name of the table or view used in the view definition.

## 28.4 INFORMATION\_SCHEMA InnoDB Tables

This section provides table definitions for `INFORMATION_SCHEMA` InnoDB tables. For related information and examples, see [Section 17.15, “InnoDB INFORMATION\\_SCHEMA Tables”](#).

`INFORMATION_SCHEMA` InnoDB tables can be used to monitor ongoing InnoDB activity, to detect inefficiencies before they turn into issues, or to troubleshoot performance and capacity issues. As your database becomes bigger and busier, running up against the limits of your hardware capacity, you monitor and tune these aspects to keep the database running smoothly.

### 28.4.1 INFORMATION\_SCHEMA InnoDB Table Reference

The following table summarizes `INFORMATION_SCHEMA` InnoDB tables. For greater detail, see the individual table descriptions.

**Table 28.3 INFORMATION\_SCHEMA InnoDB Tables**

Table Name	Description
<code>INNODB_BUFFER_PAGE</code>	Pages in InnoDB buffer pool
<code>INNODB_BUFFER_PAGE_LRU</code>	LRU ordering of pages in InnoDB buffer pool
<code>INNODB_BUFFER_POOL_STATS</code>	InnoDB buffer pool statistics
<code>INNODB_CACHED_INDEXES</code>	Number of index pages cached per index in InnoDB buffer pool
<code>INNODB_CMP</code>	Status for operations related to compressed InnoDB tables
<code>INNODB_CMP_PER_INDEX</code>	Status for operations related to compressed InnoDB tables and indexes
<code>INNODB_CMP_PER_INDEX_RESET</code>	Status for operations related to compressed InnoDB tables and indexes

Table Name	Description
INNODB_CMP_RESET	Status for operations related to compressed InnoDB tables
INNODB_CMPMEM	Status for compressed pages within InnoDB buffer pool
INNODB_CMPMEM_RESET	Status for compressed pages within InnoDB buffer pool
INNODB_COLUMNS	Columns in each InnoDB table
INNODB_DATAFILES	Data file path information for InnoDB file-per-table and general tablespaces
INNODB_FIELDS	Key columns of InnoDB indexes
INNODB_FOREIGN	InnoDB foreign-key metadata
INNODB_FOREIGN_COLS	InnoDB foreign-key column status information
INNODB_FT_BEING_DELETED	Snapshot of INNODB_FT_DELETED table
INNODB_FT_CONFIG	Metadata for InnoDB table FULLTEXT index and associated processing
INNODB_FT_DEFAULT_STOPWORD	Default list of stopwords for InnoDB FULLTEXT indexes
INNODB_FT_DELETED	Rows deleted from InnoDB table FULLTEXT index
INNODB_FT_INDEX_CACHE	Token information for newly inserted rows in InnoDB FULLTEXT index
INNODB_FT_INDEX_TABLE	Inverted index information for processing text searches against InnoDB table FULLTEXT index
INNODB_INDEXES	InnoDB index metadata
INNODB_METRICS	InnoDB performance information
INNODB_SESSION_TEMP_TABLESPACES	Session temporary-tablespace metadata
INNODB_TABLES	InnoDB table metadata
INNODB_TABLESPACES	InnoDB file-per-table, general, and undo tablespace metadata
INNODB_TABLESPACES_BRIEF	Brief file-per-table, general, undo, and system tablespace metadata
INNODB_TABLESTATS	InnoDB table low-level status information
INNODB_TEMP_TABLE_INFO	Information about active user-created InnoDB temporary tables
INNODB_TRX	Active InnoDB transaction information
INNODB_VIRTUAL	InnoDB virtual generated column metadata

## 28.4.2 The INFORMATION\_SCHEMA INNODB\_BUFFER\_PAGE Table

The `INNODB_BUFFER_PAGE` table provides information about each page in the InnoDB buffer pool.

For related usage information and examples, see [Section 17.15.5, “InnoDB INFORMATION\\_SCHEMA Buffer Pool Tables”](#).

### Warning

Querying the `INNODB_BUFFER_PAGE` table can affect performance. Do not query this table on a production system unless you are aware of the performance impact and have determined it to be acceptable. To avoid

If impacting performance on a production system, reproduce the issue you want to investigate and query buffer pool statistics on a test instance.

The [INNODB\\_BUFFER\\_PAGE](#) table has these columns:

- [POOL\\_ID](#)

The buffer pool ID. This is an identifier to distinguish between multiple buffer pool instances.

- [BLOCK\\_ID](#)

The buffer pool block ID.

- [SPACE](#)

The tablespace ID; the same value as [INNODB\\_TABLES.SPACE](#).

- [PAGE\\_NUMBER](#)

The page number.

- [PAGE\\_TYPE](#)

The page type. The following table shows the permitted values.

**Table 28.4 INNODB\_BUFFER\_PAGE.PAGE\_TYPE Values**

Page Type	Description
<a href="#">ALLOCATED</a>	Freshly allocated page
<a href="#">BLOB</a>	Uncompressed BLOB page
<a href="#">COMPRESSED_BLOB2</a>	Subsequent comp BLOB page
<a href="#">COMPRESSED_BLOB</a>	First compressed BLOB page
<a href="#">ENCRYPTED_RTREE</a>	Encrypted R-tree
<a href="#">EXTENT_DESCRIPTOR</a>	Extent descriptor page
<a href="#">FILE_SPACE_HEADER</a>	File space header
<a href="#">FIL_PAGE_TYPE_UNUSED</a>	Unused
<a href="#">IBUF_BITMAP</a>	Insert buffer bitmap
<a href="#">IBUF_FREE_LIST</a>	Insert buffer free list
<a href="#">IBUF_INDEX</a>	Insert buffer index
<a href="#">INDEX</a>	B-tree node
<a href="#">INODE</a>	Index node
<a href="#">LOB_DATA</a>	Uncompressed LOB data
<a href="#">LOB_FIRST</a>	First page of uncompressed LOB
<a href="#">LOB_INDEX</a>	Uncompressed LOB index
<a href="#">PAGE_IO_COMPRESSED</a>	Compressed page
<a href="#">PAGE_IO_COMPRESSED_ENCRYPTED</a>	Compressed and encrypted page
<a href="#">PAGE_IO_ENCRYPTED</a>	Encrypted page
<a href="#">RSEG_ARRAY</a>	Rollback segment array
<a href="#">RTREE_INDEX</a>	R-tree index
<a href="#">SDI_BLOB</a>	Uncompressed SDI BLOB
<a href="#">SDI_COMPRESSED_BLOB</a>	Compressed SDI BLOB
<a href="#">SDI_INDEX</a>	SDI index

Page Type	Description
SYSTEM	System page
TRX_SYSTEM	Transaction system data
UNDO_LOG	Undo log page
UNKNOWN	Unknown
ZLOB_DATA	Compressed LOB data
ZLOB_FIRST	First page of compressed LOB
ZLOB_FRAG	Compressed LOB fragment
ZLOB_FRAG_ENTRY	Compressed LOB fragment index
ZLOB_INDEX	Compressed LOB index

- [FLUSH\\_TYPE](#)

The flush type.

- [FIX\\_COUNT](#)

The number of threads using this block within the buffer pool. When zero, the block is eligible to be evicted.

- [IS\\_HASHED](#)

Whether a hash index has been built on this page.

- [NEWEST\\_MODIFICATION](#)

The Log Sequence Number of the youngest modification.

- [OLDEST\\_MODIFICATION](#)

The Log Sequence Number of the oldest modification.

- [ACCESS\\_TIME](#)

An abstract number used to judge the first access time of the page.

- [TABLE\\_NAME](#)

The name of the table the page belongs to. This column is applicable only to pages with a [PAGE\\_TYPE](#) value of [INDEX](#). The column is [NULL](#) if the server has not yet accessed the table.

- [INDEX\\_NAME](#)

The name of the index the page belongs to. This can be the name of a clustered index or a secondary index. This column is applicable only to pages with a [PAGE\\_TYPE](#) value of [INDEX](#).

- [NUMBER\\_RECORDS](#)

The number of records within the page.

- [DATA\\_SIZE](#)

The sum of the sizes of the records. This column is applicable only to pages with a [PAGE\\_TYPE](#) value of [INDEX](#).

- [COMPRESSED\\_SIZE](#)

The compressed page size. [NULL](#) for pages that are not compressed.

- [PAGE\\_STATE](#)

The page state. The following table shows the permitted values.

**Table 28.5 INNODB\_BUFFER\_PAGE.PAGE\_STATE Values**

Page State	Description
FILE_PAGE	A buffered file page
MEMORY	Contains a main memory object
NOT_USED	In the free list
NULL	Clean compressed pages, compressed pages in the flush list, pages used as buffer pool watch sentinels
READY_FOR_USE	A free page
REMOVE_HASH	Hash index should be removed before placing in the free list

- [IO\\_FIX](#)

Whether any I/O is pending for this page: [IO\\_NONE](#) = no pending I/O, [IO\\_READ](#) = read pending, [IO\\_WRITE](#) = write pending, [IO\\_PIN](#) = relocation and removal from the flush not permitted.

- [IS\\_OLD](#)

Whether the block is in the sublist of old blocks in the LRU list.

- [FREE\\_PAGE\\_CLOCK](#)

The value of the [freed\\_page\\_clock](#) counter when the block was the last placed at the head of the LRU list. The [freed\\_page\\_clock](#) counter tracks the number of blocks removed from the end of the LRU list.

- [IS\\_STALE](#)

Whether the page is stale.

## Example

```
mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_BUFFER_PAGE LIMIT 1\G
***** 1. row *****
 POOL_ID: 0
 BLOCK_ID: 0
 SPACE: 97
 PAGE_NUMBER: 2473
 PAGE_TYPE: INDEX
 FLUSH_TYPE: 1
 FIX_COUNT: 0
 IS_HASHED: YES
 NEWEST_MODIFICATION: 733855581
OLDEST_MODIFICATION: 0
 ACCESS_TIME: 3378385672
 TABLE_NAME: `employees`.`salaries`
 INDEX_NAME: PRIMARY
 NUMBER_RECORDS: 468
 DATA_SIZE: 14976
COMPRESSED_SIZE: 0
 PAGE_STATE: FILE_PAGE
 IO_FIX: IO_NONE
 IS_OLD: YES
 FREE_PAGE_CLOCK: 66
 IS_STALE: NO
```

## Notes

- This table is useful primarily for expert-level performance monitoring, or when developing performance-related extensions for MySQL.
- You must have the `PROCESS` privilege to query this table.
- Use the `INFORMATION_SCHEMA COLUMNS` table or the `SHOW COLUMNS` statement to view additional information about the columns of this table, including data types and default values.
- When tables, table rows, partitions, or indexes are deleted, associated pages remain in the buffer pool until space is required for other data. The `INNODB_BUFFER_PAGE` table reports information about these pages until they are evicted from the buffer pool. For more information about how the InnoDB manages buffer pool data, see [Section 17.5.1, “Buffer Pool”](#).

### 28.4.3 The INFORMATION\_SCHEMA INNODB\_BUFFER\_PAGE\_LRU Table

The `INNODB_BUFFER_PAGE_LRU` table provides information about the pages in the InnoDB buffer pool; in particular, how they are ordered in the LRU list that determines which pages to evict from the buffer pool when it becomes full.

The `INNODB_BUFFER_PAGE_LRU` table has the same columns as the `INNODB_BUFFER_PAGE` table with a few exceptions. It has `LRU_POSITION` and `COMPRESSED` columns instead of `BLOCK_ID` and `PAGE_STATE` columns, and it does not include an `IS_STALE` column.

For related usage information and examples, see [Section 17.15.5, “InnoDB INFORMATION\\_SCHEMA Buffer Pool Tables”](#).

#### Warning

Querying the `INNODB_BUFFER_PAGE_LRU` table can affect performance. Do not query this table on a production system unless you are aware of the performance impact and have determined it to be acceptable. To avoid impacting performance on a production system, reproduce the issue you want to investigate and query buffer pool statistics on a test instance.

The `INNODB_BUFFER_PAGE_LRU` table has these columns:

- `POOL_ID`

The buffer pool ID. This is an identifier to distinguish between multiple buffer pool instances.

- `LRU_POSITION`

The position of the page in the LRU list.

- `SPACE`

The tablespace ID; the same value as `INNODB_TABLES.SPACE`.

- `PAGE_NUMBER`

The page number.

- `PAGE_TYPE`

The page type. The following table shows the permitted values.

**Table 28.6 INNODB\_BUFFER\_PAGE\_LRU.PAGE\_TYPE Values**

Page Type	Description
<code>ALLOCATED</code>	Freshly allocated page
<code>BLOB</code>	Uncompressed BLOB page

Page Type	Description
COMPRESSED_BLOB2	Subsequent comp BLOB page
COMPRESSED_BLOB	First compressed BLOB page
ENCRYPTED_RTREE	Encrypted R-tree
EXTENT_DESCRIPTOR	Extent descriptor page
FILE_SPACE_HEADER	File space header
FIL_PAGE_TYPE_UNUSED	Unused
IBUF_BITMAP	Insert buffer bitmap
IBUF_FREE_LIST	Insert buffer free list
IBUF_INDEX	Insert buffer index
INDEX	B-tree node
INODE	Index node
LOB_DATA	Uncompressed LOB data
LOB_FIRST	First page of uncompressed LOB
LOB_INDEX	Uncompressed LOB index
PAGE_IO_COMPRESSED	Compressed page
PAGE_IO_COMPRESSED_ENCRYPTED	Compressed and encrypted page
PAGE_IO_ENCRYPTED	Encrypted page
RSEG_ARRAY	Rollback segment array
RTREE_INDEX	R-tree index
SDI_BLOB	Uncompressed SDI BLOB
SDI_COMPRESSED_BLOB	Compressed SDI BLOB
SDI_INDEX	SDI index
SYSTEM	System page
TRX_SYSTEM	Transaction system data
UNDO_LOG	Undo log page
UNKNOWN	Unknown
ZLOB_DATA	Compressed LOB data
ZLOB_FIRST	First page of compressed LOB
ZLOB_FRAG	Compressed LOB fragment
ZLOB_FRAG_ENTRY	Compressed LOB fragment index
ZLOB_INDEX	Compressed LOB index

- **FLUSH\_TYPE**

The flush type.

- **FIX\_COUNT**

The number of threads using this block within the buffer pool. When zero, the block is eligible to be evicted.

- **IS\_HASHED**

Whether a hash index has been built on this page.

- [NEWEST\\_MODIFICATION](#)

The Log Sequence Number of the youngest modification.

- [OLDEST\\_MODIFICATION](#)

The Log Sequence Number of the oldest modification.

- [ACCESS\\_TIME](#)

An abstract number used to judge the first access time of the page.

- [TABLE\\_NAME](#)

The name of the table the page belongs to. This column is applicable only to pages with a [PAGE\\_TYPE](#) value of [INDEX](#). The column is [NULL](#) if the server has not yet accessed the table.

- [INDEX\\_NAME](#)

The name of the index the page belongs to. This can be the name of a clustered index or a secondary index. This column is applicable only to pages with a [PAGE\\_TYPE](#) value of [INDEX](#).

- [NUMBER\\_RECORDS](#)

The number of records within the page.

- [DATA\\_SIZE](#)

The sum of the sizes of the records. This column is applicable only to pages with a [PAGE\\_TYPE](#) value of [INDEX](#).

- [COMPRESSED\\_SIZE](#)

The compressed page size. [NULL](#) for pages that are not compressed.

- [COMPRESSED](#)

Whether the page is compressed.

- [IO\\_FIX](#)

Whether any I/O is pending for this page: [IO\\_NONE](#) = no pending I/O, [IO\\_READ](#) = read pending, [IO\\_WRITE](#) = write pending.

- [IS\\_OLD](#)

Whether the block is in the sublist of old blocks in the LRU list.

- [FREE\\_PAGE\\_CLOCK](#)

The value of the [freed\\_page\\_clock](#) counter when the block was the last placed at the head of the LRU list. The [freed\\_page\\_clock](#) counter tracks the number of blocks removed from the end of the LRU list.

## Example

```
mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_BUFFER_PAGE_LRU LIMIT 1\G
***** 1. row *****
 POOL_ID: 0
 LRU_POSITION: 0
 SPACE: 97
 PAGE_NUMBER: 1984
 PAGE_TYPE: INDEX
 FLUSH_TYPE: 1
 FIX_COUNT: 0
 IS_HASHED: YES
```

```
NEWEST_MODIFICATION: 719490396
OLDEST_MODIFICATION: 0
 ACCESS_TIME: 3378383796
 TABLE_NAME: `employees`.`salaries`
 INDEX_NAME: PRIMARY
 NUMBER_RECORDS: 468
 DATA_SIZE: 14976
COMPRESSED_SIZE: 0
 COMPRESSED: NO
 IO_FIX: IO_NONE
 IS_OLD: YES
 FREE_PAGE_CLOCK: 0
```

## Notes

- This table is useful primarily for expert-level performance monitoring, or when developing performance-related extensions for MySQL.
- You must have the `PROCESS` privilege to query this table.
- Use the `INFORMATION_SCHEMA COLUMNS` table or the `SHOW COLUMNS` statement to view additional information about the columns of this table, including data types and default values.
- Querying this table can require MySQL to allocate a large block of contiguous memory, more than 64 bytes times the number of active pages in the buffer pool. This allocation could potentially cause an out-of-memory error, especially for systems with multi-gigabyte buffer pools.
- Querying this table requires MySQL to lock the data structure representing the buffer pool while traversing the LRU list, which can reduce concurrency, especially for systems with multi-gigabyte buffer pools.
- When tables, table rows, partitions, or indexes are deleted, associated pages remain in the buffer pool until space is required for other data. The `INNODB_BUFFER_PAGE_LRU` table reports information about these pages until they are evicted from the buffer pool. For more information about how the InnoDB manages buffer pool data, see [Section 17.5.1, “Buffer Pool”](#).

### 28.4.4 The INFORMATION\_SCHEMA INNODB\_BUFFER\_POOL\_STATS Table

The `INNODB_BUFFER_POOL_STATS` table provides much of the same buffer pool information provided in `SHOW ENGINE INNODB STATUS` output. Much of the same information may also be obtained using InnoDB buffer pool [server status variables](#).

The idea of making pages in the buffer pool “young” or “not young” refers to transferring them between the [sublists](#) at the head and tail of the buffer pool data structure. Pages made “young” take longer to age out of the buffer pool, while pages made “not young” are moved much closer to the point of [eviction](#).

For related usage information and examples, see [Section 17.15.5, “InnoDB INFORMATION\\_SCHEMA Buffer Pool Tables”](#).

The `INNODB_BUFFER_POOL_STATS` table has these columns:

- `POOL_ID`

The buffer pool ID. This is an identifier to distinguish between multiple buffer pool instances.

- `POOL_SIZE`

The InnoDB buffer pool size in pages.

- `FREE_BUFFERS`

The number of free pages in the InnoDB buffer pool.

- `DATABASE_PAGES`

The number of pages in the `InnoDB` buffer pool containing data. This number includes both dirty and clean pages.

- `OLD_DATABASE_PAGES`

The number of pages in the `old` buffer pool sublist.

- `MODIFIED_DATABASE_PAGES`

The number of modified (dirty) database pages.

- `PENDING_DECOMPRESS`

The number of pages pending decompression.

- `PENDING_READS`

The number of pending reads.

- `PENDING_FLUSH_LRU`

The number of pages pending flush in the LRU.

- `PENDING_FLUSH_LIST`

The number of pages pending flush in the flush list.

- `PAGES_MADE_YOUNG`

The number of pages made young.

- `PAGES_NOT_MADE_YOUNG`

The number of pages not made young.

- `PAGES_MADE_YOUNG_RATE`

The number of pages made young per second (pages made young since the last printout / time elapsed).

- `PAGES_MADE_NOT_YOUNG_RATE`

The number of pages not made per second (pages not made young since the last printout / time elapsed).

- `NUMBER_PAGES_READ`

The number of pages read.

- `NUMBER_PAGES_CREATED`

The number of pages created.

- `NUMBER_PAGES_WRITTEN`

The number of pages written.

- `PAGES_READ_RATE`

The number of pages read per second (pages read since the last printout / time elapsed).

- `PAGES_CREATE_RATE`

The number of pages created per second (pages created since the last printout / time elapsed).

## The INFORMATION\_SCHEMA INNODB\_BUFFER\_POOL\_STATS Table

---

- [PAGES\\_WRITTEN\\_RATE](#)

The number of pages written per second (pages written since the last printout / time elapsed).

- [NUMBER\\_PAGES\\_GET](#)

The number of logical read requests.

- [HIT\\_RATE](#)

The buffer pool hit rate.

- [YOUNG\\_MAKE\\_PER\\_THOUSAND\\_GETS](#)

The number of pages made young per thousand gets.

- [NOT\\_YOUNG\\_MAKE\\_PER\\_THOUSAND\\_GETS](#)

The number of pages not made young per thousand gets.

- [NUMBER\\_PAGES\\_READ\\_AHEAD](#)

The number of pages read ahead.

- [NUMBER\\_READ\\_AHEAD\\_EVICTED](#)

The number of pages read into the [InnoDB](#) buffer pool by the read-ahead background thread that were subsequently evicted without having been accessed by queries.

- [READ\\_AHEAD\\_RATE](#)

The read-ahead rate per second (pages read ahead since the last printout / time elapsed).

- [READ\\_AHEAD\\_EVICTED\\_RATE](#)

The number of read-ahead pages evicted without access per second (read-ahead pages not accessed since the last printout / time elapsed).

- [LRU\\_IO\\_TOTAL](#)

Total LRU I/O.

- [LRU\\_IO\\_CURRENT](#)

LRU I/O for the current interval.

- [UNCOMPRESS\\_TOTAL](#)

The total number of pages decompressed.

- [UNCOMPRESS\\_CURRENT](#)

The number of pages decompressed in the current interval.

## Example

```
mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_BUFFER_POOL_STATS\G
***** 1. row *****
 POOL_ID: 0
 POOL_SIZE: 8192
 FREE_BUFFERS: 1
DATABASE_PAGES: 8085
OLD_DATABASE_PAGES: 2964
MODIFIED_DATABASE_PAGES: 0
 PENDING_DECOMPRESS: 0
 PENDING_READS: 0
```

```

PENDING_FLUSH_LRU: 0
PENDING_FLUSH_LIST: 0
PAGES_MADE_YOUNG: 22821
PAGES_NOT_MADE_YOUNG: 3544303
PAGES_MADE_YOUNG_RATE: 357.62602199870594
PAGES_MADE_NOT_YOUNG_RATE: 0
NUMBER_PAGES_READ: 2389
NUMBER_PAGES_CREATED: 12385
NUMBER_PAGES_WRITTEN: 13111
PAGES_READ_RATE: 0
PAGES_CREATE_RATE: 0
PAGES_WRITTEN_RATE: 0
NUMBER_PAGES_GET: 33322210
HIT_RATE: 1000
YOUNG_MAKE_PER_THOUSAND_GETS: 18
NOT_YOUNG_MAKE_PER_THOUSAND_GETS: 0
NUMBER_PAGES_READ_AHEAD: 2024
NUMBER_READ_AHEAD_EVICTED: 0
READ_AHEAD_RATE: 0
READ_AHEAD_EVICTED_RATE: 0
LRU_IO_TOTAL: 0
LRU_IO_CURRENT: 0
UNCOMPRESS_TOTAL: 0
UNCOMPRESS_CURRENT: 0

```

## Notes

- This table is useful primarily for expert-level performance monitoring, or when developing performance-related extensions for MySQL.
- You must have the `PROCESS` privilege to query this table.
- Use the `INFORMATION_SCHEMA COLUMNS` table or the `SHOW COLUMNS` statement to view additional information about the columns of this table, including data types and default values.

### 28.4.5 The INFORMATION\_SCHEMA INNODB\_CACHED\_INDEXES Table

The `INNODB_CACHED_INDEXES` table reports the number of index pages cached in the `InnoDB` buffer pool for each index.

For related usage information and examples, see [Section 17.15.5, “InnoDB INFORMATION\\_SCHEMA Buffer Pool Tables”](#).

The `INNODB_CACHED_INDEXES` table has these columns:

- `SPACE_ID`

The tablespace ID.

- `INDEX_ID`

An identifier for the index. Index identifiers are unique across all the databases in an instance.

- `N_CACHED_PAGES`

The total number of index pages cached in the `InnoDB` buffer pool for a specific index since MySQL Server last started.

## Examples

This query returns the number of index pages cached in the `InnoDB` buffer pool for a specific index:

```

mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_CACHED_INDEXES WHERE INDEX_ID=65\G
***** 1. row *****
 SPACE_ID: 4294967294
 INDEX_ID: 65
 N_CACHED_PAGES: 45

```

This query returns the number of index pages cached in the [InnoDB](#) buffer pool for each index, using the [INNODB\\_INDEXES](#) and [INNODB\\_TABLES](#) tables to resolve the table name and index name for each [INDEX\\_ID](#) value.

```
SELECT
 tables.NAME AS table_name,
 indexes.NAME AS index_name,
 cached.N_CACHED_PAGES AS n_cached_pages
FROM
 INFORMATION_SCHEMA.INNODB_CACHED_INDEXES AS cached,
 INFORMATION_SCHEMA.INNODB_INDEXES AS indexes,
 INFORMATION_SCHEMA.INNODB_TABLES AS tables
WHERE
 cached.INDEX_ID = indexes.INDEX_ID
 AND indexes.TABLE_ID = tables.TABLE_ID;
```

## Notes

- You must have the [PROCESS](#) privilege to query this table.
- Use the [INFORMATION\\_SCHEMA COLUMNS](#) table or the [SHOW COLUMNS](#) statement to view additional information about the columns of this table, including data types and default values.

## 28.4.6 The INFORMATION\_SCHEMA INNODB\_CMP and INNODB\_CMP\_RESET Tables

The [INNODB\\_CMP](#) and [INNODB\\_CMP\\_RESET](#) tables provide status information on operations related to compressed [InnoDB](#) tables.

The [INNODB\\_CMP](#) and [INNODB\\_CMP\\_RESET](#) tables have these columns:

- [PAGE\\_SIZE](#)

The compressed page size in bytes.

- [COMPRESS\\_OPS](#)

The number of times a B-tree page of size [PAGE\\_SIZE](#) has been compressed. Pages are compressed whenever an empty page is created or the space for the uncompressed modification log runs out.

- [COMPRESS\\_OPS\\_OK](#)

The number of times a B-tree page of size [PAGE\\_SIZE](#) has been successfully compressed. This count should never exceed [COMPRESS\\_OPS](#).

- [COMPRESS\\_TIME](#)

The total time in seconds used for attempts to compress B-tree pages of size [PAGE\\_SIZE](#).

- [UNCOMPRESS\\_OPS](#)

The number of times a B-tree page of size [PAGE\\_SIZE](#) has been uncompressed. B-tree pages are uncompressed whenever compression fails or at first access when the uncompressed page does not exist in the buffer pool.

- [UNCOMPRESS\\_TIME](#)

The total time in seconds used for uncompressing B-tree pages of the size [PAGE\\_SIZE](#).

## Example

```
mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_CMP\G
***** 1. row *****
page_size: 1024
```

```

compress_ops: 0
compress_ops_ok: 0
compress_time: 0
uncompress_ops: 0
uncompress_time: 0
***** 2. row *****
 page_size: 2048
 compress_ops: 0
compress_ops_ok: 0
compress_time: 0
uncompress_ops: 0
uncompress_time: 0
***** 3. row *****
 page_size: 4096
 compress_ops: 0
compress_ops_ok: 0
compress_time: 0
uncompress_ops: 0
uncompress_time: 0
***** 4. row *****
 page_size: 8192
 compress_ops: 86955
compress_ops_ok: 81182
 compress_time: 27
 uncompress_ops: 26828
uncompress_time: 5
***** 5. row *****
 page_size: 16384
 compress_ops: 0
compress_ops_ok: 0
 compress_time: 0
 uncompress_ops: 0
uncompress_time: 0

```

## Notes

- Use these tables to measure the effectiveness of [InnoDB](#) table [compression](#) in your database.
- You must have the [PROCESS](#) privilege to query this table.
- Use the [INFORMATION\\_SCHEMA COLUMNS](#) table or the [SHOW COLUMNS](#) statement to view additional information about the columns of this table, including data types and default values.
- For usage information, see [Section 17.9.1.4, “Monitoring InnoDB Table Compression at Runtime”](#) and [Section 17.15.1.3, “Using the Compression Information Schema Tables”](#). For general information about [InnoDB](#) table compression, see [Section 17.9, “InnoDB Table and Page Compression”](#).

## 28.4.7 The INFORMATION\_SCHEMA INNODB\_CMPMEM and INNODB\_CMPMEM\_RESET Tables

The [INNODB\\_CMPMEM](#) and [INNODB\\_CMPMEM\\_RESET](#) tables provide status information on compressed pages within the [InnoDB](#) buffer pool.

The [INNODB\\_CMPMEM](#) and [INNODB\\_CMPMEM\\_RESET](#) tables have these columns:

- [PAGE\\_SIZE](#)

The block size in bytes. Each record of this table describes blocks of this size.

- [BUFFER\\_POOL\\_INSTANCE](#)

A unique identifier for the buffer pool instance.

- [PAGES\\_USED](#)

The number of blocks of size [PAGE\\_SIZE](#) that are currently in use.

- [PAGES\\_FREE](#)

The number of blocks of size [PAGE\\_SIZE](#) that are currently available for allocation. This column shows the external fragmentation in the memory pool. Ideally, these numbers should be at most 1.

- [RELOCATION\\_OPS](#)

The number of times a block of size [PAGE\\_SIZE](#) has been relocated. The buddy system can relocate the allocated “buddy neighbor” of a freed block when it tries to form a bigger freed block. Reading from the [INNODB\\_CMPMEM\\_RESET](#) table resets this count.

- [RELOCATION\\_TIME](#)

The total time in microseconds used for relocating blocks of size [PAGE\\_SIZE](#). Reading from the table [INNODB\\_CMPMEM\\_RESET](#) resets this count.

## Example

```
mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_CMPMEM\G
***** 1. row *****
 page_size: 1024
buffer_pool_instance: 0
 pages_used: 0
 pages_free: 0
 relocation_ops: 0
 relocation_time: 0

***** 2. row *****
 page_size: 2048
buffer_pool_instance: 0
 pages_used: 0
 pages_free: 0
 relocation_ops: 0
 relocation_time: 0

***** 3. row *****
 page_size: 4096
buffer_pool_instance: 0
 pages_used: 0
 pages_free: 0
 relocation_ops: 0
 relocation_time: 0

***** 4. row *****
 page_size: 8192
buffer_pool_instance: 0
 pages_used: 7673
 pages_free: 15
 relocation_ops: 4638
 relocation_time: 0

***** 5. row *****
 page_size: 16384
buffer_pool_instance: 0
 pages_used: 0
 pages_free: 0
 relocation_ops: 0
 relocation_time: 0
```

## Notes

- Use these tables to measure the effectiveness of [InnoDB](#) table [compression](#) in your database.
- You must have the [PROCESS](#) privilege to query this table.
- Use the [INFORMATION\\_SCHEMA COLUMNS](#) table or the [SHOW COLUMNS](#) statement to view additional information about the columns of this table, including data types and default values.
- For usage information, see [Section 17.9.1.4, “Monitoring InnoDB Table Compression at Runtime”](#) and [Section 17.15.1.3, “Using the Compression Information Schema Tables”](#). For general information about [InnoDB](#) table compression, see [Section 17.9, “InnoDB Table and Page Compression”](#).

## 28.4.8 The INFORMATION\_SCHEMA INNODB\_CMP\_PER\_INDEX and INNODB\_CMP\_PER\_INDEX\_RESET Tables

The `INNODB_CMP_PER_INDEX` and `INNODB_CMP_PER_INDEX_RESET` tables provide status information on operations related to compressed InnoDB tables and indexes, with separate statistics for each combination of database, table, and index, to help you evaluate the performance and usefulness of compression for specific tables.

For a compressed InnoDB table, both the table data and all the secondary indexes are compressed. In this context, the table data is treated as just another index, one that happens to contain all the columns: the [clustered index](#).

The `INNODB_CMP_PER_INDEX` and `INNODB_CMP_PER_INDEX_RESET` tables have these columns:

- `DATABASE_NAME`

The schema (database) containing the applicable table.

- `TABLE_NAME`

The table to monitor for compression statistics.

- `INDEX_NAME`

The index to monitor for compression statistics.

- `COMPRESS_OPS`

The number of compression operations attempted. Pages are compressed whenever an empty page is created or the space for the uncompressed modification log runs out.

- `COMPRESS_OPS_OK`

The number of successful compression operations. Subtract from the `COMPRESS_OPS` value to get the number of [compression failures](#). Divide by the `COMPRESS_OPS` value to get the percentage of compression failures.

- `COMPRESS_TIME`

The total time in seconds used for compressing data in this index.

- `UNCOMPRESS_OPS`

The number of uncompression operations performed. Compressed InnoDB pages are uncompressed whenever compression fails, or the first time a compressed page is accessed in the [buffer pool](#) and the uncompressed page does not exist.

- `UNCOMPRESS_TIME`

The total time in seconds used for uncompressing data in this index.

### Example

```
mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_CMP_PER_INDEX\G
***** 1. row *****
 database_name: employees
 table_name: salaries
 index_name: PRIMARY
 compress_ops: 0
compress_ops_ok: 0
 compress_time: 0
 uncompress_ops: 23451
uncompress_time: 4
***** 2. row *****
```

```
database_name: employees
 table_name: salaries
 index_name: emp_no
 compress_ops: 0
compress_ops_ok: 0
 compress_time: 0
uncompress_ops: 1597
uncompress_time: 0
```

## Notes

- Use these tables to measure the effectiveness of [InnoDB](#) table [compression](#) for specific tables, indexes, or both.
- You must have the [PROCESS](#) privilege to query these tables.
- Use the [INFORMATION\\_SCHEMA COLUMNS](#) table or the [SHOW COLUMNS](#) statement to view additional information about the columns of these tables, including data types and default values.
- Because collecting separate measurements for every index imposes substantial performance overhead, [INNODB\\_CMP\\_PER\\_INDEX](#) and [INNODB\\_CMP\\_PER\\_INDEX\\_RESET](#) statistics are not gathered by default. You must enable the [innodb\\_cmp\\_per\\_index\\_enabled](#) system variable before performing the operations on compressed tables that you want to monitor.
- For usage information, see [Section 17.9.1.4, “Monitoring InnoDB Table Compression at Runtime”](#) and [Section 17.15.1.3, “Using the Compression Information Schema Tables”](#). For general information about [InnoDB](#) table compression, see [Section 17.9, “InnoDB Table and Page Compression”](#).

### 28.4.9 The INFORMATION\_SCHEMA INNODB\_COLUMNS Table

The [INNODB\\_COLUMNS](#) table provides metadata about [InnoDB](#) table columns.

For related usage information and examples, see [Section 17.15.3, “InnoDB INFORMATION\\_SCHEMA Schema Object Tables”](#).

The [INNODB\\_COLUMNS](#) table has these columns:

- [TABLE\\_ID](#)

An identifier representing the table associated with the column; the same value as [INNODB\\_TABLES.TABLE\\_ID](#).

- [NAME](#)

The name of the column. These names can be uppercase or lowercase depending on the [lower\\_case\\_table\\_names](#) setting. There are no special system-reserved names for columns.

- [POS](#)

The ordinal position of the column within the table, starting from 0 and incrementing sequentially. When a column is dropped, the remaining columns are reordered so that the sequence has no gaps. The [POS](#) value for a virtual generated column encodes the column sequence number and ordinal position of the column. For more information, see the [POS](#) column description in [Section 28.4.29, “The INFORMATION\\_SCHEMA INNODB\\_VIRTUAL Table”](#).

- [MTYPE](#)

Stands for “main type”. A numeric identifier for the column type. 1 = [VARCHAR](#), 2 = [CHAR](#), 3 = [FIXBINARY](#), 4 = [BINARY](#), 5 = [BLOB](#), 6 = [INT](#), 7 = [SYS\\_CHILD](#), 8 = [SYS](#), 9 = [FLOAT](#), 10 = [DOUBLE](#), 11 = [DECIMAL](#), 12 = [VARMYSQ](#)L, 13 = [MYSQL](#), 14 = [GEOMETRY](#).

- [PRTYPE](#)

The InnoDB “precise type”, a binary value with bits representing MySQL data type, character set code, and nullability.

- [LEN](#)

The column length, for example 4 for `INT` and 8 for `BIGINT`. For character columns in multibyte character sets, this length value is the maximum length in bytes needed to represent a definition such as `VARCHAR(N)`; that is, it might be  $2*N$ ,  $3*N$ , and so on depending on the character encoding.

- [HAS\\_DEFAULT](#)

A boolean value indicating whether a column that was added instantly using `ALTER TABLE ... ADD COLUMN` with `ALGORITHM=INSTANT` has a default value. All columns added instantly have a default value, which makes this column an indicator of whether the column was added instantly.

- [DEFAULT\\_VALUE](#)

The initial default value of a column that was added instantly using `ALTER TABLE ... ADD COLUMN` with `ALGORITHM=INSTANT`. If the default value is `NULL` or was not specified, this column reports `NULL`. An explicitly specified non-`NULL` default value is shown in an internal binary format. Subsequent modifications of the column default value do not change the value reported by this column.

## Example

```
mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_COLUMNS WHERE TABLE_ID = 71\G
***** 1. row *****
 TABLE_ID: 71
 NAME: col1
 POS: 0
 MTYPE: 6
 PRTYPE: 1027
 LEN: 4
 HAS_DEFAULT: 0
DEFAULT_VALUE: NULL
***** 2. row *****
 TABLE_ID: 71
 NAME: col2
 POS: 1
 MTYPE: 2
 PRTYPE: 524542
 LEN: 10
 HAS_DEFAULT: 0
DEFAULT_VALUE: NULL
***** 3. row *****
 TABLE_ID: 71
 NAME: col3
 POS: 2
 MTYPE: 1
 PRTYPE: 524303
 LEN: 10
 HAS_DEFAULT: 0
DEFAULT_VALUE: NULL
```

## Notes

- You must have the `PROCESS` privilege to query this table.
- Use the `INFORMATION_SCHEMA COLUMNS` table or the `SHOW COLUMNS` statement to view additional information about the columns of this table, including data types and default values.

### 28.4.10 The INFORMATION\_SCHEMA INNODB\_DATAFILES Table

The `INNODB_DATAFILES` table provides data file path information for InnoDB file-per-table and general tablespaces.

For related usage information and examples, see [Section 17.15.3, “InnoDB INFORMATION\\_SCHEMA Schema Object Tables”](#).

**Note**

The `INFORMATION_SCHEMA FILES` table reports metadata for InnoDB tablespace types including file-per-table tablespaces, general tablespaces, the system tablespace, the global temporary tablespace, and undo tablespaces.

The `INNODB_DATAFILES` table has these columns:

- `SPACE`

The tablespace ID.

- `PATH`

The tablespace data file path. If a `file-per-table` tablespace is created in a location outside the MySQL data directory, the path value is a fully qualified directory path. Otherwise, the path is relative to the data directory.

**Example**

```
mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_DATAFILES WHERE SPACE = 57\G
***** 1. row *****
SPACE: 57
PATH: ./test/t1.ibd
```

**Notes**

- You must have the `PROCESS` privilege to query this table.
- Use the `INFORMATION_SCHEMA COLUMNS` table or the `SHOW COLUMNS` statement to view additional information about the columns of this table, including data types and default values.

**28.4.11 The INFORMATION\_SCHEMA INNODB\_FIELDS Table**

The `INNODB_FIELDS` table provides metadata about the key columns (fields) of InnoDB indexes.

For related usage information and examples, see [Section 17.15.3, “InnoDB INFORMATION\\_SCHEMA Schema Object Tables”](#).

The `INNODB_FIELDS` table has these columns:

- `INDEX_ID`

An identifier for the index associated with this key field; the same value as `INNODB_INDEXES . INDEX_ID`.

- `NAME`

The name of the original column from the table; the same value as `INNODB_COLUMNS . NAME`.

- `POS`

The ordinal position of the key field within the index, starting from 0 and incrementing sequentially. When a column is dropped, the remaining columns are reordered so that the sequence has no gaps.

**Example**

```
mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_FIELDS WHERE INDEX_ID = 117\G
***** 1. row *****
INDEX_ID: 117
NAME: col1
POS: 0
```

## Notes

- You must have the `PROCESS` privilege to query this table.
- Use the `INFORMATION_SCHEMA COLUMNS` table or the `SHOW COLUMNS` statement to view additional information about the columns of this table, including data types and default values.

### 28.4.12 The INFORMATION\_SCHEMA INNODB\_FOREIGN Table

The `INNODB_FOREIGN` table provides metadata about InnoDB foreign keys.

For related usage information and examples, see [Section 17.15.3, “InnoDB INFORMATION\\_SCHEMA Schema Object Tables”](#).

The `INNODB_FOREIGN` table has these columns:

- `ID`

The name (not a numeric value) of the foreign key index, preceded by the schema (database) name (for example, `test/products_fk`).

- `FOR_NAME`

The name of the `child table` in this foreign key relationship.

- `REF_NAME`

The name of the `parent table` in this foreign key relationship.

- `N_COLS`

The number of columns in the foreign key index.

- `TYPE`

A collection of bit flags with information about the foreign key column, ORed together. 0 = `ON DELETE/UPDATE RESTRICT`, 1 = `ON DELETE CASCADE`, 2 = `ON DELETE SET NULL`, 4 = `ON UPDATE CASCADE`, 8 = `ON UPDATE SET NULL`, 16 = `ON DELETE NO ACTION`, 32 = `ON UPDATE NO ACTION`.

## Example

```
mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_FOREIGN\G
***** 1. row *****
 ID: test/fk1
 FOR_NAME: test/child
 REF_NAME: test/parent
 N_COLS: 1
 TYPE: 1
```

## Notes

- You must have the `PROCESS` privilege to query this table.
- Use the `INFORMATION_SCHEMA COLUMNS` table or the `SHOW COLUMNS` statement to view additional information about the columns of this table, including data types and default values.

### 28.4.13 The INFORMATION\_SCHEMA INNODB\_FOREIGN\_COLS Table

The `INNODB_FOREIGN_COLS` table provides status information about InnoDB foreign key columns.

For related usage information and examples, see [Section 17.15.3, “InnoDB INFORMATION\\_SCHEMA Schema Object Tables”](#).

The `INNODB_FOREIGN_COLS` table has these columns:

- `ID`  
The foreign key index associated with this index key field; the same value as `INNODB_FOREIGN.ID`.
- `FOR_COL_NAME`  
The name of the associated column in the child table.
- `REF_COL_NAME`  
The name of the associated column in the parent table.
- `POS`  
The ordinal position of this key field within the foreign key index, starting from 0.

## Example

```
mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_FOREIGN_COLS WHERE ID = 'test/fk1'\G
***** 1. row ****
ID: test/fk1
FOR_COL_NAME: parent_id
REF_COL_NAME: id
POS: 0
```

## Notes

- You must have the `PROCESS` privilege to query this table.
- Use the `INFORMATION_SCHEMA COLUMNS` table or the `SHOW COLUMNS` statement to view additional information about the columns of this table, including data types and default values.

### 28.4.14 The INFORMATION\_SCHEMA INNODB\_FT\_BEING\_DELETED Table

The `INNODB_FT_BEING_DELETED` table provides a snapshot of the `INNODB_FT_DELETED` table; it is used only during an `OPTIMIZE TABLE` maintenance operation. When `OPTIMIZE TABLE` is run, the `INNODB_FT_BEING_DELETED` table is emptied, and `DOC_ID` values are removed from the `INNODB_FT_DELETED` table. Because the contents of `INNODB_FT_BEING_DELETED` typically have a short lifetime, this table has limited utility for monitoring or debugging. For information about running `OPTIMIZE TABLE` on tables with `FULLTEXT` indexes, see [Section 14.9.6, “Fine-Tuning MySQL Full-Text Search”](#).

This table is empty initially. Before querying it, set the value of the `innodb_ft_aux_table` system variable to the name (including the database name) of the table that contains the `FULLTEXT` index (for example, `test/articles`). The output appears similar to the example provided for the `INNODB_FT_DELETED` table.

For related usage information and examples, see [Section 17.15.4, “InnoDB INFORMATION\\_SCHEMA FULLTEXT Index Tables”](#).

The `INNODB_FT_BEING_DELETED` table has these columns:

- `DOC_ID`  
The document ID of the row that is in the process of being deleted. This value might reflect the value of an ID column that you defined for the underlying table, or it can be a sequence value generated by InnoDB when the table contains no suitable column. This value is used when you perform text searches, to skip rows in the `INNODB_FT_INDEX_TABLE` table before data for deleted rows is physically removed from the `FULLTEXT` index by an `OPTIMIZE TABLE` statement. For more information, see [Optimizing InnoDB Full-Text Indexes](#).

## Notes

- Use the `INFORMATION_SCHEMA COLUMNS` table or the `SHOW COLUMNS` statement to view additional information about the columns of this table, including data types and default values.
- You must have the `PROCESS` privilege to query this table.
- For more information about `InnoDB FULLTEXT` search, see [Section 17.6.2.4, “InnoDB Full-Text Indexes”](#), and [Section 14.9, “Full-Text Search Functions”](#).

## 28.4.15 The INFORMATION\_SCHEMA INNODB\_FT\_CONFIG Table

The `INNODB_FT_CONFIG` table provides metadata about the `FULLTEXT` index and associated processing for an `InnoDB` table.

This table is empty initially. Before querying it, set the value of the `innodb_ft_aux_table` system variable to the name (including the database name) of the table that contains the `FULLTEXT` index (for example, `test/articles`).

For related usage information and examples, see [Section 17.15.4, “InnoDB INFORMATION\\_SCHEMA FULLTEXT Index Tables”](#).

The `INNODB_FT_CONFIG` table has these columns:

- `KEY`

The name designating an item of metadata for an `InnoDB` table containing a `FULLTEXT` index.

The values for this column might change, depending on the needs for performance tuning and debugging for `InnoDB` full-text processing. The key names and their meanings include:

- `optimize_checkpoint_limit`: The number of seconds after which an `OPTIMIZE TABLE` run stops.
- `synced_doc_id`: The next `DOC_ID` to be issued.
- `stopword_table_name`: The `database/table` name for a user-defined stopword table. The `VALUE` column is empty if there is no user-defined stopword table.
- `use_stopword`: Indicates whether a stopword table is used, which is defined when the `FULLTEXT` index is created.
- `VALUE`

The value associated with the corresponding `KEY` column, reflecting some limit or current value for an aspect of a `FULLTEXT` index for an `InnoDB` table.

## Example

```
mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_FT_CONFIG;
+-----+-----+
| KEY | VALUE |
+-----+-----+
| optimize_checkpoint_limit | 180 |
| synced_doc_id | 0 |
| stopword_table_name | test/my_stopwords |
| use_stopword | 1 |
+-----+-----+
```

## Notes

- This table is intended only for internal configuration. It is not intended for statistical information purposes.

- You must have the `PROCESS` privilege to query this table.
- Use the `INFORMATION_SCHEMA COLUMNS` table or the `SHOW COLUMNS` statement to view additional information about the columns of this table, including data types and default values.
- For more information about InnoDB FULLTEXT search, see [Section 17.6.2.4, “InnoDB Full-Text Indexes”](#), and [Section 14.9, “Full-Text Search Functions”](#).

## 28.4.16 The INFORMATION\_SCHEMA INNODB\_FT\_DEFAULT\_STOPWORD Table

The `INNODB_FT_DEFAULT_STOPWORD` table holds a list of [stopwords](#) that are used by default when creating a `FULLTEXT` index on InnoDB tables. For information about the default InnoDB stopword list and how to define your own stopword lists, see [Section 14.9.4, “Full-Text Stopwords”](#).

For related usage information and examples, see [Section 17.15.4, “InnoDB INFORMATION\\_SCHEMA FULLTEXT Index Tables”](#).

The `INNODB_FT_DEFAULT_STOPWORD` table has these columns:

- `value`

A word that is used by default as a stopword for `FULLTEXT` indexes on InnoDB tables. This is not used if you override the default stopword processing with either the `innodb_ft_server_stopword_table` or the `innodb_ft_user_stopword_table` system variable.

### Example

```
mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_FT_DEFAULT_STOPWORD;
+-----+
| value |
+-----+
| a |
| about |
| an |
| are |
| as |
| at |
| be |

| und |
```

```
| the |
| www |
+-----+
36 rows in set (0.00 sec)
```

## Notes

- You must have the `PROCESS` privilege to query this table.
- Use the `INFORMATION_SCHEMA COLUMNS` table or the `SHOW COLUMNS` statement to view additional information about the columns of this table, including data types and default values.
- For more information about `InnoDB FULLTEXT` search, see [Section 17.6.2.4, “InnoDB Full-Text Indexes”](#), and [Section 14.9, “Full-Text Search Functions”](#).

## 28.4.17 The INFORMATION\_SCHEMA INNODB\_FT\_DELETED Table

The `INNODB_FT_DELETED` table stores rows that are deleted from the `FULLTEXT` index for an `InnoDB` table. To avoid expensive index reorganization during DML operations for an `InnoDB` `FULLTEXT` index, the information about newly deleted words is stored separately, filtered out of search results when you do a text search, and removed from the main search index only when you issue an `OPTIMIZE TABLE` statement for the `InnoDB` table. For more information, see [Optimizing InnoDB Full-Text Indexes](#).

This table is empty initially. Before querying it, set the value of the `innodb_ft_aux_table` system variable to the name (including the database name) of the table that contains the `FULLTEXT` index (for example, `test/articles`).

For related usage information and examples, see [Section 17.15.4, “InnoDB INFORMATION\\_SCHEMA FULLTEXT Index Tables”](#).

The `INNODB_FT_DELETED` table has these columns:

- `DOC_ID`

The document ID of the newly deleted row. This value might reflect the value of an ID column that you defined for the underlying table, or it can be a sequence value generated by `InnoDB` when the table contains no suitable column. This value is used when you perform text searches, to skip rows in the `INNODB_FT_INDEX_TABLE` table before data for deleted rows is physically removed from the `FULLTEXT` index by an `OPTIMIZE TABLE` statement. For more information, see [Optimizing InnoDB Full-Text Indexes](#).

## Example

```
mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_FT_DELETED;
+-----+
| DOC_ID |
+-----+
| 6 |
| 7 |
| 8 |
+-----+
```

## Notes

- You must have the `PROCESS` privilege to query this table.
- Use the `INFORMATION_SCHEMA COLUMNS` table or the `SHOW COLUMNS` statement to view additional information about the columns of this table, including data types and default values.
- For more information about `InnoDB FULLTEXT` search, see [Section 17.6.2.4, “InnoDB Full-Text Indexes”](#), and [Section 14.9, “Full-Text Search Functions”](#).

## 28.4.18 The INFORMATION\_SCHEMA INNODB\_FT\_INDEX\_CACHE Table

The `INNODB_FT_INDEX_CACHE` table provides token information about newly inserted rows in a `FULLTEXT` index. To avoid expensive index reorganization during DML operations, the information about newly indexed words is stored separately, and combined with the main search index only when `OPTIMIZE TABLE` is run, when the server is shut down, or when the cache size exceeds a limit defined by the `innodb_ft_cache_size` or `innodb_ft_total_cache_size` system variable.

This table is empty initially. Before querying it, set the value of the `innodb_ft_aux_table` system variable to the name (including the database name) of the table that contains the `FULLTEXT` index (for example, `test/articles`).

For related usage information and examples, see [Section 17.15.4, “InnoDB INFORMATION\\_SCHEMA FULLTEXT Index Tables”](#).

The `INNODB_FT_INDEX_CACHE` table has these columns:

- `WORD`

A word extracted from the text of a newly inserted row.

- `FIRST_DOC_ID`

The first document ID in which this word appears in the `FULLTEXT` index.

- `LAST_DOC_ID`

The last document ID in which this word appears in the `FULLTEXT` index.

- `DOC_COUNT`

The number of rows in which this word appears in the `FULLTEXT` index. The same word can occur several times within the cache table, once for each combination of `DOC_ID` and `POSITION` values.

- `DOC_ID`

The document ID of the newly inserted row. This value might reflect the value of an ID column that you defined for the underlying table, or it can be a sequence value generated by `InnoDB` when the table contains no suitable column.

- `POSITION`

The position of this particular instance of the word within the relevant document identified by the `DOC_ID` value. The value does not represent an absolute position; it is an offset added to the `POSITION` of the previous instance of that word.

## Notes

- This table is empty initially. Before querying it, set the value of the `innodb_ft_aux_table` system variable to the name (including the database name) of the table that contains the `FULLTEXT` index (for example `test/articles`). The following example demonstrates how to use the `innodb_ft_aux_table` system variable to show information about a `FULLTEXT` index for a specified table.

```
mysql> USE test;
mysql> CREATE TABLE articles (
 id INT UNSIGNED AUTO_INCREMENT NOT NULL PRIMARY KEY,
 title VARCHAR(200),
 body TEXT,
 FULLTEXT (title,body)
) ENGINE=InnoDB;

mysql> INSERT INTO articles (title,body) VALUES
('MySQL Tutorial','DBMS stands for DataBase ...'),
('How To Use MySQL Well','After you went through a ...'),
```

```

('Optimizing MySQL','In this tutorial we show ...'),
('1001 MySQL Tricks','1. Never run mysqld as root. 2.'),
('MySQL vs. YourSQL','In the following database comparison ...'),
('MySQL Security','When configured properly, MySQL ...');

mysql> SET GLOBAL innodb_ft_aux_table = 'test/articles';

mysql> SELECT WORD, DOC_COUNT, DOC_ID, POSITION
 FROM INFORMATION_SCHEMA.INNODB_FT_INDEX_CACHE LIMIT 5;
+-----+-----+-----+
| WORD | DOC_COUNT | DOC_ID | POSITION |
+-----+-----+-----+
| 1001 | 1 | 4 | 0 |
| after | 1 | 2 | 22 |
| comparison | 1 | 5 | 44 |
| configured | 1 | 6 | 20 |
| database | 2 | 1 | 31 |
+-----+-----+-----+

```

- You must have the `PROCESS` privilege to query this table.
- Use the `INFORMATION_SCHEMA COLUMNS` table or the `SHOW COLUMNS` statement to view additional information about the columns of this table, including data types and default values.
- For more information about `InnoDB FULLTEXT` search, see [Section 17.6.2.4, “InnoDB Full-Text Indexes”](#), and [Section 14.9, “Full-Text Search Functions”](#).

## 28.4.19 The INFORMATION\_SCHEMA INNODB\_FT\_INDEX\_TABLE Table

The `INNODB_FT_INDEX_TABLE` table provides information about the inverted index used to process text searches against the `FULLTEXT` index of an `InnoDB` table.

This table is empty initially. Before querying it, set the value of the `innodb_ft_aux_table` system variable to the name (including the database name) of the table that contains the `FULLTEXT` index (for example, `test/articles`).

For related usage information and examples, see [Section 17.15.4, “InnoDB INFORMATION\\_SCHEMA FULLTEXT Index Tables”](#).

The `INNODB_FT_INDEX_TABLE` table has these columns:

- `WORD`

A word extracted from the text of the columns that are part of a `FULLTEXT`.

- `FIRST_DOC_ID`

The first document ID in which this word appears in the `FULLTEXT` index.

- `LAST_DOC_ID`

The last document ID in which this word appears in the `FULLTEXT` index.

- `DOC_COUNT`

The number of rows in which this word appears in the `FULLTEXT` index. The same word can occur several times within the cache table, once for each combination of `DOC_ID` and `POSITION` values.

- `DOC_ID`

The document ID of the row containing the word. This value might reflect the value of an ID column that you defined for the underlying table, or it can be a sequence value generated by `InnoDB` when the table contains no suitable column.

- `POSITION`

The position of this particular instance of the word within the relevant document identified by the `DOC_ID` value.

## Notes

- This table is empty initially. Before querying it, set the value of the `innodb_ft_aux_table` system variable to the name (including the database name) of the table that contains the `FULLTEXT` index (for example, `test/articles`). The following example demonstrates how to use the `innodb_ft_aux_table` system variable to show information about a `FULLTEXT` index for a specified table. Before information for newly inserted rows appears in `INNODB_FT_INDEX_TABLE`, the `FULLTEXT` index cache must be flushed to disk. This is accomplished by running an `OPTIMIZE TABLE` operation on the indexed table with the `innodb_optimize_fulltext_only` system variable enabled. (The example disables that variable again at the end because it is intended to be enabled only temporarily.)

```
mysql> USE test;

mysql> CREATE TABLE articles (
 id INT UNSIGNED AUTO_INCREMENT NOT NULL PRIMARY KEY,
 title VARCHAR(200),
 body TEXT,
 FULLTEXT (title,body)
) ENGINE=InnoDB;

mysql> INSERT INTO articles (title,body) VALUES
 ('MySQL Tutorial','DBMS stands for DataBase ...'),
 ('How To Use MySQL Well','After you went through a ...'),
 ('Optimizing MySQL','In this tutorial we show ...'),
 ('1001 MySQL Tricks','1. Never run mysqld as root. 2. ...'),
 ('MySQL vs. YourSQL','In the following database comparison ...'),
 ('MySQL Security','When configured properly, MySQL ...');

mysql> SET GLOBAL innodb_optimize_fulltext_only=ON;

mysql> OPTIMIZE TABLE articles;
+-----+-----+-----+
| Table | Op | Msg_type | Msg_text |
+-----+-----+-----+
| test.articles | optimize | status | OK |
+-----+-----+-----+

mysql> SET GLOBAL innodb_ft_aux_table = 'test/articles';

mysql> SELECT WORD, DOC_COUNT, DOC_ID, POSITION
 FROM INFORMATION_SCHEMA.INNODB_FT_INDEX_TABLE LIMIT 5;
+-----+-----+-----+
| WORD | DOC_COUNT | DOC_ID | POSITION |
+-----+-----+-----+
| 1001 | 1 | 4 | 0 |
| after | 1 | 2 | 22 |
| comparison | 1 | 5 | 44 |
| configured | 1 | 6 | 20 |
| database | 2 | 1 | 31 |
+-----+-----+-----+

mysql> SET GLOBAL innodb_optimize_fulltext_only=OFF;
```

- You must have the `PROCESS` privilege to query this table.
- Use the `INFORMATION_SCHEMA COLUMNS` table or the `SHOW COLUMNS` statement to view additional information about the columns of this table, including data types and default values.
- For more information about InnoDB `FULLTEXT` search, see [Section 17.6.2.4, “InnoDB Full-Text Indexes”](#), and [Section 14.9, “Full-Text Search Functions”](#).

## 28.4.20 The INFORMATION\_SCHEMA INNODB\_INDEXES Table

The `INNODB_INDEXES` table provides metadata about InnoDB indexes.

For related usage information and examples, see [Section 17.15.3, “InnoDB INFORMATION\\_SCHEMA Schema Object Tables”](#).

The `INNODB_INDEXES` table has these columns:

- `INDEX_ID`

An identifier for the index. Index identifiers are unique across all the databases in an instance.

- `NAME`

The name of the index. Most indexes created implicitly by InnoDB have consistent names but the index names are not necessarily unique. Examples: `PRIMARY` for a primary key index, `GEN_CLUST_INDEX` for the index representing a primary key when one is not specified, and `ID_IND`, `FOR_IND`, and `REF_IND` for foreign key constraints.

- `TABLE_ID`

An identifier representing the table associated with the index; the same value as `INNODB_TABLES.TABLE_ID`.

- `TYPE`

A numeric value derived from bit-level information that identifies the index type. 0 = nonunique secondary index; 1 = automatically generated clustered index (`GEN_CLUST_INDEX`); 2 = unique nonclustered index; 3 = clustered index; 32 = full-text index; 64 = spatial index; 128 = secondary index on a [virtual generated column](#).

- `N_FIELDS`

The number of columns in the index key. For `GEN_CLUST_INDEX` indexes, this value is 0 because the index is created using an artificial value rather than a real table column.

- `PAGE_NO`

The root page number of the index B-tree. For full-text indexes, the `PAGE_NO` column is unused and set to -1 (`FIL_NULL`) because the full-text index is laid out in several B-trees (auxiliary tables).

- `SPACE`

An identifier for the tablespace where the index resides. 0 means the InnoDB system tablespace. Any other number represents a table created with a separate `.ibd` file in `file-per-table` mode. This identifier stays the same after a `TRUNCATE TABLE` statement. Because all indexes for a table reside in the same tablespace as the table, this value is not necessarily unique.

- `MERGE_THRESHOLD`

The merge threshold value for index pages. If the amount of data in an index page falls below the `MERGE_THRESHOLD` value when a row is deleted or when a row is shortened by an update operation, InnoDB attempts to merge the index page with the neighboring index page. The default threshold value is 50%. For more information, see [Section 17.8.11, “Configuring the Merge Threshold for Index Pages”](#).

## Example

```
mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_INDEXES WHERE TABLE_ID = 34\G
***** 1. row *****
INDEX_ID: 39
NAME: GEN_CLUST_INDEX
TABLE_ID: 34
TYPE: 1
```

```
N_FIELDS: 0
PAGE_NO: 3
SPACE: 23
MERGE_THRESHOLD: 50
***** 2. row *****
INDEX_ID: 40
NAME: i1
TABLE_ID: 34
TYPE: 0
N_FIELDS: 1
PAGE_NO: 4
SPACE: 23
MERGE_THRESHOLD: 50
```

## Notes

- You must have the `PROCESS` privilege to query this table.
- Use the `INFORMATION_SCHEMA COLUMNS` table or the `SHOW COLUMNS` statement to view additional information about the columns of this table, including data types and default values.

### 28.4.21 The INFORMATION\_SCHEMA INNODB\_METRICS Table

The `INNODB_METRICS` table provides a wide variety of `InnoDB` performance information, complementing the specific focus areas of the Performance Schema tables for `InnoDB`. With simple queries, you can check the overall health of the system. With more detailed queries, you can diagnose issues such as performance bottlenecks, resource shortages, and application issues.

Each monitor represents a point within the `InnoDB` source code that is instrumented to gather counter information. Each counter can be started, stopped, and reset. You can also perform these actions for a group of counters using their common module name.

By default, relatively little data is collected. To start, stop, and reset counters, set one of the system variables `innodb_monitor_enable`, `innodb_monitor_disable`, `innodb_monitor_reset`, or `innodb_monitor_reset_all`, using the name of the counter, the name of the module, a wildcard match for such a name using the “%” character, or the special keyword `all`.

For usage information, see [Section 17.15.6, “InnoDB INFORMATION\\_SCHEMA Metrics Table”](#).

The `INNODB_METRICS` table has these columns:

- **NAME**  
A unique name for the counter.
- **SUBSYSTEM**  
The aspect of `InnoDB` that the metric applies to.
- **COUNT**  
The value since the counter was enabled.
- **MAX\_COUNT**  
The maximum value since the counter was enabled.
- **MIN\_COUNT**  
The minimum value since the counter was enabled.
- **AVG\_COUNT**  
The average value since the counter was enabled.

- [COUNT\\_RESET](#)

The counter value since it was last reset. (The `_RESET` columns act like the lap counter on a stopwatch: you can measure the activity during some time interval, while the cumulative figures are still available in `COUNT`, `MAX_COUNT`, and so on.)

- [MAX\\_COUNT\\_RESET](#)

The maximum counter value since it was last reset.

- [MIN\\_COUNT\\_RESET](#)

The minimum counter value since it was last reset.

- [AVG\\_COUNT\\_RESET](#)

The average counter value since it was last reset.

- [TIME\\_ENABLED](#)

The timestamp of the last start.

- [TIME\\_DISABLED](#)

The timestamp of the last stop.

- [TIME\\_ELAPSED](#)

The elapsed time in seconds since the counter started.

- [TIME\\_RESET](#)

The timestamp of the last reset.

- [STATUS](#)

Whether the counter is still running (`enabled`) or stopped (`disabled`).

- [TYPE](#)

Whether the item is a cumulative counter, or measures the current value of some resource.

- [COMMENT](#)

The counter description.

## Example

```
mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_METRICS WHERE NAME='dml_inserts'\G
***** 1. row *****
 NAME: dml_inserts
 SUBSYSTEM: dml
 COUNT: 3
 MAX_COUNT: 3
 MIN_COUNT: NULL
 AVG_COUNT: 0.046153846153846156
 COUNT_RESET: 3
MAX_COUNT_RESET: 3
MIN_COUNT_RESET: NULL
AVG_COUNT_RESET: NULL
 TIME_ENABLED: 2014-12-04 14:18:28
 TIME_DISABLED: NULL
 TIME_ELAPSED: 65
 TIME_RESET: NULL
 STATUS: enabled
 TYPE: status_counter
```

COMMENT: Number of rows inserted
----------------------------------

## Notes

- You must have the `PROCESS` privilege to query this table.
- Use the `INFORMATION_SCHEMA COLUMNS` table or the `SHOW COLUMNS` statement to view additional information about the columns of this table, including data types and default values.
- Transaction counter `COUNT` values may differ from the number of transaction events reported in Performance Schema `EVENTS_TRANSACTIONS_SUMMARY` tables. InnoDB counts only those transactions that it executes, whereas Performance Schema collects events for all non-aborted transactions initiated by the server, including empty transactions.

## 28.4.22 The INFORMATION\_SCHEMA INNODB\_SESSION\_TEMP\_TABLESPACES Table

The `INNODB_SESSION_TEMP_TABLESPACES` table provides metadata about session temporary tablespaces used for internal and user-created temporary tables.

The `INNODB_SESSION_TEMP_TABLESPACES` table has these columns:

- `ID`

The process or session ID.

- `SPACE`

The tablespace ID. A range of 400 thousand space IDs is reserved for session temporary tablespaces. Session temporary tablespaces are recreated each time the server is started. Space IDs are not persisted when the server is shut down and may be reused.

- `PATH`

The tablespace data file path. A session temporary tablespace has an `.ibt` file extension.

- `SIZE`

The size of the tablespace, in bytes.

- `STATE`

The state of the tablespace. `ACTIVE` indicates that the tablespace is currently used by a session. `INACTIVE` indicates that the tablespace is in the pool of available session temporary tablespaces.

- `PURPOSE`

The purpose of the tablespace. `INTRINSIC` indicates that the tablespace is used for optimized internal temporary tables use by the optimizer. `SLAVE` indicates that the tablespace is allocated for storing user-created temporary tables on a replica. `USER` indicates that the tablespace is used for user-created temporary tables. `NONE` indicates that the tablespace is not in use.

## Example

```
mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_SESSION_TEMP_TABLESPACES;
+----+-----+-----+-----+-----+-----+
| ID | SPACE | PATH | SIZE | STATE | PURPOSE |
+----+-----+-----+-----+-----+-----+
| 8 | 4294566162 | ./#innodb_temp/temp_10.ibt | 81920 | ACTIVE | INTRINSIC |
| 8 | 4294566161 | ./#innodb_temp/temp_9.ibt | 98304 | ACTIVE | USER |
| 0 | 4294566153 | ./#innodb_temp/temp_1.ibt | 81920 | INACTIVE | NONE |
| 0 | 4294566154 | ./#innodb_temp/temp_2.ibt | 81920 | INACTIVE | NONE |
| 0 | 4294566155 | ./#innodb_temp/temp_3.ibt | 81920 | INACTIVE | NONE |
+----+-----+-----+-----+-----+-----+
```

	0	4294566156	./#innodb_temp/temp_4.ibt	81920	INACTIVE	NONE		
	0	4294566157	./#innodb_temp/temp_5.ibt	81920	INACTIVE	NONE		
	0	4294566158	./#innodb_temp/temp_6.ibt	81920	INACTIVE	NONE		
	0	4294566159	./#innodb_temp/temp_7.ibt	81920	INACTIVE	NONE		
	0	4294566160	./#innodb_temp/temp_8.ibt	81920	INACTIVE	NONE		

## Notes

- You must have the `PROCESS` privilege to query this table.
- Use the `INFORMATION_SCHEMA COLUMNS` table or the `SHOW COLUMNS` statement to view additional information about the columns of this table, including data types and default values.

### 28.4.23 The INFORMATION\_SCHEMA INNODB\_TABLES Table

The `INNODB_TABLES` table provides metadata about InnoDB tables.

For related usage information and examples, see [Section 17.15.3, “InnoDB INFORMATION\\_SCHEMA Schema Object Tables”](#).

The `INNODB_TABLES` table has these columns:

- `TABLE_ID`

An identifier for the InnoDB table. This value is unique across all databases in the instance.

- `NAME`

The name of the table, preceded by the schema (database) name where appropriate (for example, `test/t1`). Names of databases and user tables are in the same case as they were originally defined, possibly influenced by the `lower_case_table_names` setting.

- `FLAG`

A numeric value that represents bit-level information about table format and storage characteristics.

- `N_COLS`

The number of columns in the table. The number reported includes three hidden columns that are created by InnoDB (`DB_ROW_ID`, `DB_TRX_ID`, and `DB_ROLL_PTR`). The number reported also includes virtual generated columns, if present.

- `SPACE`

An identifier for the tablespace where the table resides. 0 means the InnoDB system tablespace. Any other number represents either a file-per-table tablespace or a general tablespace. This identifier stays the same after a `TRUNCATE TABLE` statement. For file-per-table tablespaces, this identifier is unique for tables across all databases in the instance.

- `ROW_FORMAT`

The table's row format (`Compact`, `Redundant`, `Dynamic`, or `Compressed`).

- `ZIP_PAGE_SIZE`

The zip page size. Applies only to tables with a row format of `Compressed`.

- `SPACE_TYPE`

The type of tablespace to which the table belongs. Possible values include `System` for the system tablespace, `General` for general tablespaces, and `Single` for file-per-table tablespaces. Tables assigned to the system tablespace using `CREATE TABLE` or `ALTER TABLE`

TABLESPACE=innodb\_system have a SPACE\_TYPE of General. For more information, see CREATE TABLESPACE.

- INSTANT\_COLS

The number of columns that existed before the first instant column was added using ALTER TABLE ... ADD COLUMN with ALGORITHM=INSTANT. This column is no longer used.

- TOTAL\_ROW\_VERSIONS

The number of row versions for the table. The initial value is 0. The value is incremented by ALTER TABLE ... ALGORITHM=INSTANT operations that add or remove columns. When a table with instantly added or dropped columns is rebuilt due to a table-rebuilding ALTER TABLE or OPTIMIZE TABLE operation, the value is reset to 0. For more information, see Column Operations.

The maximum TOTAL\_ROW\_VERSIONS value is 64. This maximum value changes from 64 to 255 as of MySQL 9.1.0.

## Example

```
mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_TABLES WHERE TABLE_ID = 214\G
***** 1. row *****
 TABLE_ID: 1064
 NAME: test/t1
 FLAG: 33
 N_COLS: 6
 SPACE: 3
 ROW_FORMAT: Dynamic
 ZIP_PAGE_SIZE: 0
 SPACE_TYPE: Single
 INSTANT_COLS: 0
TOTAL_ROW_VERSIONS: 3
```

## Notes

- You must have the PROCESS privilege to query this table.
- Use the INFORMATION\_SCHEMA COLUMNS table or the SHOW COLUMNS statement to view additional information about the columns of this table, including data types and default values.

## 28.4.24 The INFORMATION\_SCHEMA INNODB\_TABLESPACES Table

The INNODB\_TABLESPACES table provides metadata about InnoDB file-per-table, general, and undo tablespaces.

For related usage information and examples, see Section 17.15.3, “InnoDB INFORMATION\_SCHEMA Schema Object Tables”.

### Note

The INFORMATION\_SCHEMA FILES table reports metadata for InnoDB tablespace types including file-per-table tablespaces, general tablespaces, the system tablespace, the global temporary tablespace, and undo tablespaces.

The INNODB\_TABLESPACES table has these columns:

- SPACE

The tablespace ID.

- NAME

The schema (database) and table name.

- [FLAG](#)

A numeric value that represents bit-level information about tablespace format and storage characteristics.

- [ROW\\_FORMAT](#)

The tablespace row format ([Compact](#) or [Redundant](#), [Dynamic](#) or [Compressed](#), or [Undo](#)). The data in this column is interpreted from the tablespace flag information that resides in the data file.

There is no way to determine from this flag information if the tablespace row format is [Redundant](#) or [Compact](#), which is why one of the possible [ROW\\_FORMAT](#) values is [Compact](#) or [Redundant](#).

- [PAGE\\_SIZE](#)

The tablespace page size. The data in this column is interpreted from the tablespace flags information that resides in the [.ibd](#) file.

- [ZIP\\_PAGE\\_SIZE](#)

The tablespace zip page size. The data in this column is interpreted from the tablespace flags information that resides in the [.ibd](#) file.

- [SPACE\\_TYPE](#)

The type of tablespace. Possible values include [General](#) for general tablespaces, [Single](#) for file-per-table tablespaces, [System](#) for the system tablespace, and [Undo](#) for undo tablespaces.

- [FS\\_BLOCK\\_SIZE](#)

The file system block size, which is the unit size used for hole punching. This column pertains to the [InnoDB transparent page compression](#) feature.

- [FILE\\_SIZE](#)

The apparent size of the file, which represents the maximum size of the file, uncompressed. This column pertains to the [InnoDB transparent page compression](#) feature.

- [ALLOCATED\\_SIZE](#)

The actual size of the file, which is the amount of space allocated on disk. This column pertains to the [InnoDB transparent page compression](#) feature.

- [AUTOEXTEND\\_SIZE](#)

The auto-extend size of the tablespace.

- [SERVER\\_VERSION](#)

The MySQL version that created the tablespace, or the MySQL version into which the tablespace was imported, or the version of the last major MySQL version upgrade. The value is unchanged by a release series upgrade, such as an upgrade from MySQL 8.4.[x](#) to 8.4.[y](#). The value can be considered a “creation” marker or “certified” marker for the tablespace.

- [SPACE\\_VERSION](#)

The tablespace version, used to track changes to the tablespace format.

- [ENCRYPTION](#)

Whether the tablespace is encrypted.

- [STATE](#)

The tablespace state.

For file-per-table and general tablespaces, states include:

- **normal**: The tablespace is normal and active.
- **discarded**: The tablespace was discarded by an `ALTER TABLE ... DISCARD TABLESPACE` statement.
- **corrupted**: The tablespace is identified by InnoDB as corrupted.

For undo tablespaces, states include:

- **active**: Rollback segments in the undo tablespace can be allocated to new transactions.
- **inactive**: Rollback segments in the undo tablespace are no longer used by new transactions. The truncate process is in progress. The undo tablespace was either selected by the purge thread implicitly or was made inactive by an `ALTER UNDO TABLESPACE ... SET INACTIVE` statement.
- **empty**: The undo tablespace was truncated and is no longer active. It is ready to be dropped or made active again by an `ALTER UNDO TABLESPACE ... SET INACTIVE` statement.

## Example

```
mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_TABLESPACES WHERE SPACE = 26\G
***** 1. row *****
 SPACE: 26
 NAME: test/t1
 FLAG: 0
 ROW_FORMAT: Compact or Redundant
 PAGE_SIZE: 16384
 ZIP_PAGE_SIZE: 0
 SPACE_TYPE: Single
 FS_BLOCK_SIZE: 4096
 FILE_SIZE: 98304
 ALLOCATED_SIZE: 65536
 AUTOEXTEND_SIZE: 0
 SERVER_VERSION: 8.4.0
 SPACE_VERSION: 1
 ENCRYPTION: N
 STATE: normal
```

## Notes

- You must have the `PROCESS` privilege to query this table.
- Use the `INFORMATION_SCHEMA COLUMNS` table or the `SHOW COLUMNS` statement to view additional information about the columns of this table, including data types and default values.

## 28.4.25 The INFORMATION\_SCHEMA INNODB\_TABLESPACES\_BRIEF Table

The `INNODB_TABLESPACES_BRIEF` table provides space ID, name, path, flag, and space type metadata for file-per-table, general, undo, and system tablespaces.

`INNODB_TABLESPACES` provides the same metadata but loads more slowly because other metadata provided by the table, such as `FS_BLOCK_SIZE`, `FILE_SIZE`, and `ALLOCATED_SIZE`, must be loaded dynamically.

Space and path metadata is also provided by the `INNODB_DATAFILES` table.

The `INNODB_TABLESPACES_BRIEF` table has these columns:

- **SPACE**

The tablespace ID.

- **NAME**

The tablespace name. For file-per-table tablespaces, the name is in the form of *schema/table\_name*.

- **PATH**

The tablespace data file path. If a **file-per-table** tablespace is created in a location outside the MySQL data directory, the path value is a fully qualified directory path. Otherwise, the path is relative to the data directory.

- **FLAG**

A numeric value that represents bit-level information about tablespace format and storage characteristics.

- **SPACE\_TYPE**

The type of tablespace. Possible values include **General** for InnoDB general tablespaces, **Single** for InnoDB file-per-table tablespaces, and **System** for the InnoDB system tablespace.

## Example

```
mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_TABLESPACES_BRIEF WHERE SPACE = 7;
+-----+-----+-----+-----+
| SPACE | NAME | PATH | FLAG | SPACE_TYPE |
+-----+-----+-----+-----+
| 7 | test/t1 | ./test/t1.ibd | 16417 | Single |
+-----+-----+-----+-----+
```

## Notes

- You must have the **PROCESS** privilege to query this table.
- Use the **INFORMATION\_SCHEMA COLUMNS** table or the **SHOW COLUMNS** statement to view additional information about the columns of this table, including data types and default values.

## 28.4.26 The INFORMATION\_SCHEMA INNODB\_TABLESTATS View

The **INNODB\_TABLESTATS** table provides a view of low-level status information about InnoDB tables. This data is used by the MySQL optimizer to calculate which index to use when querying an InnoDB table. This information is derived from in-memory data structures rather than data stored on disk. There is no corresponding internal InnoDB system table.

InnoDB tables are represented in this view if they have been opened since the last server restart and have not aged out of the table cache. Tables for which persistent stats are available are always represented in this view.

Table statistics are updated only for **DELETE** or **UPDATE** operations that modify indexed columns. Statistics are not updated by operations that modify only nonindexed columns.

**ANALYZE TABLE** clears table statistics and sets the **STATS\_INITIALIZED** column to **Uninitialized**. Statistics are collected again the next time the table is accessed.

For related usage information and examples, see [Section 17.15.3, “InnoDB INFORMATION\\_SCHEMA Schema Object Tables”](#).

The **INNODB\_TABLESTATS** table has these columns:

- **TABLE\_ID**

An identifier representing the table for which statistics are available; the same value as `INNODB_TABLES.TABLE_ID`.

- `NAME`

The name of the table; the same value as `INNODB_TABLES.NAME`.

- `STATS_INITIALIZED`

The value is `Initialized` if the statistics are already collected, `Uninitialized` if not.

- `NUM_ROWS`

The current estimated number of rows in the table. Updated after each DML operation. The value could be imprecise if uncommitted transactions are inserting into or deleting from the table.

- `CLUST_INDEX_SIZE`

The number of pages on disk that store the clustered index, which holds the `InnoDB` table data in primary key order. This value might be null if no statistics are collected yet for the table.

- `OTHER_INDEX_SIZE`

The number of pages on disk that store all secondary indexes for the table. This value might be null if no statistics are collected yet for the table.

- `MODIFIED_COUNTER`

The number of rows modified by DML operations, such as `INSERT`, `UPDATE`, `DELETE`, and also cascade operations from foreign keys. This column is reset each time table statistics are recalculated

- `AUTOINC`

The next number to be issued for any auto-increment-based operation. The rate at which the `AUTOINC` value changes depends on how many times auto-increment numbers have been requested and how many numbers are granted per request.

- `REF_COUNT`

When this counter reaches zero, the table metadata can be evicted from the table cache.

## Example

```
mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_TABLESTATS where TABLE_ID = 71\G
***** 1. row *****
 TABLE_ID: 71
 NAME: test/t1
STATS_INITIALIZED: Initialized
 NUM_ROWS: 1
 CLUST_INDEX_SIZE: 1
 OTHER_INDEX_SIZE: 0
MODIFIED_COUNTER: 1
 AUTOINC: 0
 REF_COUNT: 1
```

## Notes

- This table is useful primarily for expert-level performance monitoring, or when developing performance-related extensions for MySQL.
- You must have the `PROCESS` privilege to query this table.
- Use the `INFORMATION_SCHEMA.COLUMNS` table or the `SHOW COLUMNS` statement to view additional information about the columns of this table, including data types and default values.

## 28.4.27 The INFORMATION\_SCHEMA INNODB\_TEMP\_TABLE\_INFO Table

The `INNODB_TEMP_TABLE_INFO` table provides information about user-created InnoDB temporary tables that are active in an InnoDB instance. It does not provide information about internal InnoDB temporary tables used by the optimizer. The `INNODB_TEMP_TABLE_INFO` table is created when first queried, exists only in memory, and is not persisted to disk.

For usage information and examples, see [Section 17.15.7, “InnoDB INFORMATION\\_SCHEMA Temporary Table Info Table”](#).

The `INNODB_TEMP_TABLE_INFO` table has these columns:

- `TABLE_ID`

The table ID of the temporary table.

- `NAME`

The name of the temporary table.

- `N_COLS`

The number of columns in the temporary table. The number includes three hidden columns created by InnoDB (`DB_ROW_ID`, `DB_TRX_ID`, and `DB_ROLL_PTR`).

- `SPACE`

The ID of the temporary tablespace where the temporary table resides.

### Example

```
mysql> CREATE TEMPORARY TABLE t1 (c1 INT PRIMARY KEY) ENGINE=INNODB;
mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_TEMP_TABLE_INFO\G
***** 1. row *****
TABLE_ID: 97
 NAME: #sql18c88_43_0
 N_COLS: 4
 SPACE: 76
```

### Notes

- This table is useful primarily for expert-level monitoring.
- You must have the `PROCESS` privilege to query this table.
- Use the `INFORMATION_SCHEMA COLUMNS` table or the `SHOW COLUMNS` statement to view additional information about the columns of this table, including data types and default values.

## 28.4.28 The INFORMATION\_SCHEMA INNODB\_TRX Table

The `INNODB_TRX` table provides information about every transaction currently executing inside InnoDB, including whether the transaction is waiting for a lock, when the transaction started, and the SQL statement the transaction is executing, if any.

For usage information, see [Section 17.15.2.1, “Using InnoDB Transaction and Locking Information”](#).

The `INNODB_TRX` table has these columns:

- `TRX_ID`

A unique transaction ID number, internal to InnoDB. These IDs are not created for transactions that are read only and nonlocking. For details, see [Section 10.5.3, “Optimizing InnoDB Read-Only Transactions”](#).

- [TRX\\_WEIGHT](#)

The weight of a transaction, reflecting (but not necessarily the exact count of) the number of rows altered and the number of rows locked by the transaction. To resolve a deadlock, [InnoDB](#) selects the transaction with the smallest weight as the “victim” to roll back. Transactions that have changed nontransactional tables are considered heavier than others, regardless of the number of altered and locked rows.

- [TRX\\_STATE](#)

The transaction execution state. Permitted values are `RUNNING`, `LOCK_WAIT`, `ROLLING_BACK`, and `COMMITTING`.

- [TRX\\_STARTED](#)

The transaction start time.

- [TRX\\_REQUESTED\\_LOCK\\_ID](#)

The ID of the lock the transaction is currently waiting for, if [TRX\\_STATE](#) is `LOCK_WAIT`; otherwise `NULL`. To obtain details about the lock, join this column with the `ENGINE_LOCK_ID` column of the Performance Schema `data_locks` table.

- [TRX\\_WAIT\\_STARTED](#)

The time when the transaction started waiting on the lock, if [TRX\\_STATE](#) is `LOCK_WAIT`; otherwise `NULL`.

- [TRX\\_MYSQL\\_THREAD\\_ID](#)

The MySQL thread ID. To obtain details about the thread, join this column with the `ID` column of the `INFORMATION_SCHEMA PROCESSLIST` table, but see [Section 17.15.2.3, “Persistence and Consistency of InnoDB Transaction and Locking Information”](#).

- [TRX\\_QUERY](#)

The SQL statement that is being executed by the transaction.

- [TRX\\_OPERATION\\_STATE](#)

The transaction's current operation, if any; otherwise `NULL`.

- [TRX\\_TABLES\\_IN\\_USE](#)

The number of [InnoDB](#) tables used while processing the current SQL statement of this transaction.

- [TRX\\_TABLES\\_LOCKED](#)

The number of [InnoDB](#) tables that the current SQL statement has row locks on. (Because these are row locks, not table locks, the tables can usually still be read from and written to by multiple transactions, despite some rows being locked.)

- [TRX\\_LOCK\\_STRUCTS](#)

The number of locks reserved by the transaction.

- [TRX\\_LOCK\\_MEMORY\\_BYTES](#)

The total size taken up by the lock structures of this transaction in memory.

- [TRX\\_ROWS\\_LOCKED](#)

The approximate number of rows locked by this transaction. The value might include delete-marked rows that are physically present but not visible to the transaction.

- [TRX\\_ROWS\\_MODIFIED](#)

The number of modified and inserted rows in this transaction.

- [TRX\\_CONCURRENCY\\_TICKETS](#)

A value indicating how much work the current transaction can do before being swapped out, as specified by the [innodb\\_concurrency\\_tickets](#) system variable.

- [TRX\\_ISOLATION\\_LEVEL](#)

The isolation level of the current transaction.

- [TRX\\_UNIQUE\\_CHECKS](#)

Whether unique checks are turned on or off for the current transaction. For example, they might be turned off during a bulk data load.

- [TRX\\_FOREIGN\\_KEY\\_CHECKS](#)

Whether foreign key checks are turned on or off for the current transaction. For example, they might be turned off during a bulk data load.

- [TRX\\_LAST\\_FOREIGN\\_KEY\\_ERROR](#)

The detailed error message for the last foreign key error, if any; otherwise [NULL](#).

- [TRX\\_ADAPTIVE\\_HASH\\_LATCHED](#)

Whether the adaptive hash index is locked by the current transaction. When the adaptive hash index search system is partitioned, a single transaction does not lock the entire adaptive hash index. Adaptive hash index partitioning is controlled by [innodb\\_adaptive\\_hash\\_index\\_parts](#), which is set to 8 by default.

- [TRX\\_ADAPTIVE\\_HASH\\_TIMEOUT](#)

Deprecated in MySQL 5.7.8. Always returns 0.

Whether to relinquish the search latch immediately for the adaptive hash index, or reserve it across calls from MySQL. When there is no adaptive hash index contention, this value remains zero and statements reserve the latch until they finish. During times of contention, it counts down to zero, and statements release the latch immediately after each row lookup. When the adaptive hash index search system is partitioned (controlled by [innodb\\_adaptive\\_hash\\_index\\_parts](#)), the value remains 0.

- [TRX\\_IS\\_READ\\_ONLY](#)

A value of 1 indicates the transaction is read only.

- [TRX\\_AUTOCOMMIT\\_NON\\_LOCKING](#)

A value of 1 indicates the transaction is a [SELECT](#) statement that does not use the [FOR UPDATE](#) or [LOCK IN SHARED MODE](#) clauses, and is executing with [autocommit](#) enabled so that the transaction contains only this one statement. When this column and [TRX\\_IS\\_READ\\_ONLY](#) are both 1, [InnoDB](#) optimizes the transaction to reduce the overhead associated with transactions that change table data.

- [TRX\\_SCHEDULE\\_WEIGHT](#)

The transaction schedule weight assigned by the Contention-Aware Transaction Scheduling (CATS) algorithm to transactions waiting for a lock. The value is relative to the values of other transactions. A higher value has a greater weight. A value is computed only for transactions in a [LOCK\\_WAIT](#)

state, as reported by the `TRX_STATE` column. A NULL value is reported for transactions that are not waiting for a lock. The `TRX_SCHEDULE_WEIGHT` value is different from the `TRX_WEIGHT` value, which is computed by a different algorithm for a different purpose.

## Example

```
mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_TRX\G
***** 1. row *****
 trx_id: 1510
 trx_state: RUNNING
 trx_started: 2014-11-19 13:24:40
 trx_requested_lock_id: NULL
 trx_wait_started: NULL
 trx_weight: 586739
 trx_mysql_thread_id: 2
 trx_query: DELETE FROM employees.salaries WHERE salary > 65000
 trx_operation_state: updating or deleting
 trx_tables_in_use: 1
 trx_tables_locked: 1
 trx_lock_structs: 3003
 trx_lock_memory_bytes: 450768
 trx_rows_locked: 1407513
 trx_rows_modified: 583736
 trx_concurrency_tickets: 0
 trx_isolation_level: REPEATABLE READ
 trx_unique_checks: 1
 trx_foreign_key_checks: 1
 trx_last_foreign_key_error: NULL
 trx_adaptive_hash_latched: 0
 trx_adaptive_hash_timeout: 10000
 trx_is_read_only: 0
 trx_autocommit_non_locking: 0
 trx_schedule_weight: NULL
```

## Notes

- Use this table to help diagnose performance problems that occur during times of heavy concurrent load. Its contents are updated as described in [Section 17.15.2.3, “Persistence and Consistency of InnoDB Transaction and Locking Information”](#).
- You must have the `PROCESS` privilege to query this table.
- Use the `INFORMATION_SCHEMA COLUMNS` table or the `SHOW COLUMNS` statement to view additional information about the columns of this table, including data types and default values.

## 28.4.29 The INFORMATION\_SCHEMA INNODB\_VIRTUAL Table

The `INNODB_VIRTUAL` table provides metadata about InnoDB virtual generated columns and columns upon which virtual generated columns are based.

A row appears in the `INNODB_VIRTUAL` table for each column upon which a virtual generated column is based.

The `INNODB_VIRTUAL` table has these columns:

- `TABLE_ID`

An identifier representing the table associated with the virtual column; the same value as `INNODB_TABLES.TABLE_ID`.

- `POS`

The position value of the [virtual generated column](#). The value is large because it encodes the column sequence number and ordinal position. The formula used to calculate the value uses a bitwise operation:

```
((nth virtual generated column for the InnoDB instance + 1) << 16)
+ the ordinal position of the virtual generated column
```

For example, if the first virtual generated column in the `InnoDB` instance is the third column of the table, the formula is `(0 + 1) << 16) + 2`. The first virtual generated column in the `InnoDB` instance is always number 0. As the third column in the table, the ordinal position of the virtual generated column is 2. Ordinal positions are counted from 0.

- `BASE_POS`

The ordinal position of the columns upon which a virtual generated column is based.

## Example

```
mysql> CREATE TABLE `t1` (
 `a` int(11) DEFAULT NULL,
 `b` int(11) DEFAULT NULL,
 `c` int(11) GENERATED ALWAYS AS (a+b) VIRTUAL,
 `h` varchar(10) DEFAULT NULL
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4;

mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_VIRTUAL
WHERE TABLE_ID IN
 (SELECT TABLE_ID FROM INFORMATION_SCHEMA.INNODB_TABLES
 WHERE NAME LIKE "test/t1");
+-----+-----+-----+
| TABLE_ID | POS | BASE_POS |
+-----+-----+-----+
| 98 | 65538 | 0 |
| 98 | 65538 | 1 |
+-----+-----+-----+
```

## Notes

- If a constant value is assigned to a [virtual generated column](#), as in the following table, an entry for the column does not appear in the `INNODB_VIRTUAL` table. For an entry to appear, a virtual generated column must have a base column.

```
CREATE TABLE `t1` (
 `a` int(11) DEFAULT NULL,
 `b` int(11) DEFAULT NULL,
 `c` int(11) GENERATED ALWAYS AS (5) VIRTUAL
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4;
```

However, metadata for such a column does appear in the `INNODB_COLUMNS` table.

- You must have the `PROCESS` privilege to query this table.
- Use the `INFORMATION_SCHEMA COLUMNS` table or the `SHOW COLUMNS` statement to view additional information about the columns of this table, including data types and default values.

## 28.5 INFORMATION\_SCHEMA Thread Pool Tables

### Note

The `INFORMATION_SCHEMA` thread pool tables are deprecated, and subject to removal in a future version of MySQL. You should use the versions available as Performance Schema tables instead. See [Section 29.12.16, “Performance Schema Thread Pool Tables”](#). Applications should transition away from the old tables to the new tables. For example, if an application uses this query:

```
SELECT * FROM INFORMATION_SCHEMA.TP_THREAD_STATE;
```

The application should use this query instead:

```
SELECT * FROM performance_schema.tp_thread_state;
```

The following sections describe the [INFORMATION\\_SCHEMA](#) tables associated with the thread pool plugin (see [Section 7.6.3, “MySQL Enterprise Thread Pool”](#)). They provide information about thread pool operation:

- [TP\\_THREAD\\_GROUP\\_STATE](#): Information about thread pool thread group states
- [TP\\_THREAD\\_GROUP\\_STATS](#): Thread group statistics
- [TP\\_THREAD\\_STATE](#): Information about thread pool thread states

Rows in these tables represent snapshots in time. In the case of [TP\\_THREAD\\_STATE](#), all rows for a thread group comprise a snapshot in time. Thus, the MySQL server holds the mutex of the thread group while producing the snapshot. But it does not hold mutexes on all thread groups at the same time, to prevent a statement against [TP\\_THREAD\\_STATE](#) from blocking the entire MySQL server.

The [INFORMATION\\_SCHEMA](#) thread pool tables are implemented by individual plugins and the decision whether to load one can be made independently of the others (see [Section 7.6.3.2, “Thread Pool Installation”](#)). However, the content of all the tables depends on the thread pool plugin being enabled. If a table plugin is enabled but the thread pool plugin is not, the table becomes visible and can be accessed but is empty.

## 28.5.1 INFORMATION\_SCHEMA Thread Pool Table Reference

The following table summarizes [INFORMATION\\_SCHEMA](#) thread pool tables. For greater detail, see the individual table descriptions.

**Table 28.7 INFORMATION\_SCHEMA Thread Pool Tables**

Table Name	Description
<a href="#">TP_THREAD_GROUP_STATE</a>	Thread pool thread group states
<a href="#">TP_THREAD_GROUP_STATS</a>	Thread pool thread group statistics
<a href="#">TP_THREAD_STATE</a>	Thread pool thread information

## 28.5.2 The INFORMATION\_SCHEMA TP\_THREAD\_GROUP\_STATE Table

### Note

The [INFORMATION\\_SCHEMA](#) thread pool tables are deprecated, and subject to removal in a future version of MySQL. You should use the versions available as Performance Schema tables instead. See [Section 29.12.16, “Performance Schema Thread Pool Tables”](#). Applications should transition away from the old tables to the new tables. For example, if an application uses this query:

```
SELECT * FROM INFORMATION_SCHEMA.TP_THREAD_GROUP_STATE;
```

The application should use this query instead:

```
SELECT * FROM performance_schema.tp_thread_group_state;
```

The [TP\\_THREAD\\_GROUP\\_STATE](#) table has one row per thread group in the thread pool. Each row provides information about the current state of a group.

For descriptions of the columns in the [INFORMATION\\_SCHEMA TP\\_THREAD\\_GROUP\\_STATE](#) table, see [Section 29.12.16.2, “The tp\\_thread\\_group\\_state Table”](#). The Performance Schema [tp\\_thread\\_group\\_state](#) table has equivalent columns.

## 28.5.3 The INFORMATION\_SCHEMA TP\_THREAD\_GROUP\_STATS Table

**Note**

The [INFORMATION\\_SCHEMA](#) thread pool tables are deprecated, and subject to removal in a future version of MySQL. You should use the versions available as Performance Schema tables instead. See [Section 29.12.16, “Performance Schema Thread Pool Tables”](#). Applications should transition away from the old tables to the new tables. For example, if an application uses this query:

```
SELECT * FROM INFORMATION_SCHEMA.TP_THREAD_GROUP_STATS;
```

The application should use this query instead:

```
SELECT * FROM performance_schema.tp_thread_group_stats;
```

The [TP\\_THREAD\\_GROUP\\_STATS](#) table reports statistics per thread group. There is one row per group.

For descriptions of the columns in the [INFORMATION\\_SCHEMA TP\\_THREAD\\_GROUP\\_STATS](#) table, see [Section 29.12.16.3, “The tp\\_thread\\_group\\_stats Table”](#). The Performance Schema [tp\\_thread\\_group\\_stats](#) table has equivalent columns.

## 28.5.4 The INFORMATION\_SCHEMA TP\_THREAD\_STATE Table

**Note**

The [INFORMATION\\_SCHEMA](#) thread pool tables are deprecated, and subject to removal in a future version of MySQL. You should use the versions available as Performance Schema tables instead. See [Section 29.12.16, “Performance Schema Thread Pool Tables”](#). Applications should transition away from the old tables to the new tables. For example, if an application uses this query:

```
SELECT * FROM INFORMATION_SCHEMA.TP_THREAD_STATE;
```

The application should use this query instead:

```
SELECT * FROM performance_schema.tp_thread_state;
```

The [TP\\_THREAD\\_STATE](#) table has one row per thread created by the thread pool to handle connections.

For descriptions of the columns in the [INFORMATION\\_SCHEMA TP\\_THREAD\\_STATE](#) table, see [Section 29.12.16.4, “The tp\\_thread\\_state Table”](#). The Performance Schema [tp\\_thread\\_state](#) table has equivalent columns.

## 28.6 INFORMATION\_SCHEMA Connection Control Tables

The following sections describe the [INFORMATION\\_SCHEMA](#) tables associated with the [connection\\_control](#) plugin.

### 28.6.1 INFORMATION\_SCHEMA Connection Control Table Reference

The following table summarizes [INFORMATION\\_SCHEMA](#) connection control tables. For greater detail, see the individual table descriptions.

**Table 28.8 INFORMATION\_SCHEMA Connection Control Tables**

Table Name	Description
<a href="#">CONNECTION_CONTROL_FAILED_LOGIN_ATTEMPTS</a>	Current number of consecutive failed connection attempts per account

### 28.6.2 The INFORMATION\_SCHEMA CONNECTION\_CONTROL\_FAILED\_LOGIN\_ATTEMPTS Table

This table provides information about the current number of consecutive failed connection attempts per account (user/host combination).

`CONNECTION_CONTROL_FAILED_LOGIN_ATTEMPTS` has these columns:

- `USERHOST`

The user/host combination indicating an account that has failed connection attempts, in `'user_name'@'host_name'` format.

- `FAILED_ATTEMPTS`

The current number of consecutive failed connection attempts for the `USERHOST` value. This counts all failed attempts, regardless of whether they were delayed. The number of attempts for which the server added a delay to its response is the difference between the `FAILED_ATTEMPTS` value and the `connection_control_failed_connections_threshold` system variable.

## Notes

- The `CONNECTION_CONTROL_FAILED_LOGIN_ATTEMPTS` plugin must be activated for this table to be available, and the `CONNECTION_CONTROL` plugin must be activated or the table contents are always empty. See [Section 8.4.2, “Connection Control Plugins”](#).
- The table contains rows only for accounts that have had one or more consecutive failed connection attempts without a subsequent successful attempt. When an account connects successfully, its failed-connection count is reset to zero and the server removes any row corresponding to the account.
- Assigning a value to the `connection_control_failed_connections_threshold` system variable at runtime resets all accumulated failed-connection counters to zero, which causes the table to become empty.

## 28.7 INFORMATION\_SCHEMA MySQL Enterprise Firewall Tables

The following sections describe the `INFORMATION_SCHEMA` tables associated with MySQL Enterprise Firewall (see [Section 8.4.7, “MySQL Enterprise Firewall”](#)). They provide views into the firewall in-memory data cache. These tables are available only if the appropriate firewall plugins are enabled.

### 28.7.1 INFORMATION\_SCHEMA Firewall Table Reference

The following table summarizes `INFORMATION_SCHEMA` firewall tables. For greater detail, see the individual table descriptions.

**Table 28.9 INFORMATION\_SCHEMA Firewall Tables**

Table Name	Description	Deprecated
<code>MYSQL_FIREWALL_USERS</code>	Firewall in-memory data for account profiles	Yes
<code>MYSQL_FIREWALL_WHITELIST</code>	Firewall in-memory data for account profile allowlists	Yes

### 28.7.2 The INFORMATION\_SCHEMA MYSQL\_FIREWALL\_USERS Table

The `MYSQL_FIREWALL_USERS` table provides a view into the in-memory data cache for MySQL Enterprise Firewall. It lists names and operational modes of registered firewall account profiles. It is used in conjunction with the `mysql.firewall_users` system table that provides persistent storage of firewall data; see [MySQL Enterprise Firewall Tables](#).

The `MYSQL_FIREWALL_USERS` table has these columns:

- **USERHOST**

The account profile name. Each account name has the format `user_name@host_name`.

- **MODE**

The current operational mode for the profile. Permitted mode values are `OFF`, `DETECTING`, `PROTECTING`, `RECORDING`, and `RESET`. For details about their meanings, see [Firewall Concepts](#).

This table is deprecated and subject to removal in a future MySQL version. See [Migrating Account Profiles to Group Profiles](#).

### 28.7.3 The INFORMATION\_SCHEMA MYSQL\_FIREWALL\_WHITELIST Table

The `MYSQL_FIREWALL_WHITELIST` table provides a view into the in-memory data cache for MySQL Enterprise Firewall. It lists allowlist rules of registered firewall account profiles. It is used in conjunction with the `mysql.firewall_whitelist` system table that provides persistent storage of firewall data; see [MySQL Enterprise Firewall Tables](#).

The `MYSQL_FIREWALL_WHITELIST` table has these columns:

- **USERHOST**

The account profile name. Each account name has the format `user_name@host_name`.

- **RULE**

A normalized statement indicating an acceptable statement pattern for the profile. A profile allowlist is the union of its rules.

This table is deprecated and subject to removal in a future MySQL version. See [Migrating Account Profiles to Group Profiles](#).

## 28.8 Extensions to SHOW Statements

Some extensions to `SHOW` statements accompany the implementation of `INFORMATION_SCHEMA`:

- `SHOW` can be used to get information about the structure of `INFORMATION_SCHEMA` itself.
- Several `SHOW` statements accept a `WHERE` clause that provides more flexibility in specifying which rows to display.

`INFORMATION_SCHEMA` is an information database, so its name is included in the output from `SHOW DATABASES`. Similarly, `SHOW TABLES` can be used with `INFORMATION_SCHEMA` to obtain a list of its tables:

```
mysql> SHOW TABLES FROM INFORMATION_SCHEMA;
+-----+
| Tables_in_INFORMATION_SCHEMA |
+-----+
| CHARACTER_SETS
| COLLATIONS
| COLLATION_CHARACTER_SET_APPLICABILITY
| COLUMNS
| COLUMN_PRIVILEGES
| ENGINES
| EVENTS
| FILES
| KEY_COLUMN_USAGE
| PARTITIONS
| PLUGINS
| PROCESSLIST
| REFERENTIAL_CONSTRAINTS
| ROUTINES
+-----+
```

```

| SCHEMATA
| SCHEMA_PRIVILEGES
| STATISTICS
| TABLES
| TABLE_CONSTRAINTS
| TABLE_PRIVILEGES
| TRIGGERS
| USER_PRIVILEGES
| VIEWS
+-----+

```

`SHOW COLUMNS` and `DESCRIBE` can display information about the columns in individual `INFORMATION_SCHEMA` tables.

`SHOW` statements that accept a `LIKE` clause to limit the rows displayed also permit a `WHERE` clause that specifies more general conditions that selected rows must satisfy:

```

SHOW CHARACTER SET
SHOW COLLATION
SHOW COLUMNS
SHOW DATABASES
SHOW FUNCTION STATUS
SHOW INDEX
SHOW OPEN TABLES
SHOW PROCEDURE STATUS
SHOW STATUS
SHOW TABLE STATUS
SHOW TABLES
SHOW TRIGGERS
SHOW VARIABLES

```

The `WHERE` clause, if present, is evaluated against the column names displayed by the `SHOW` statement. For example, the `SHOW CHARACTER SET` statement produces these output columns:

```

mysql> SHOW CHARACTER SET;
+-----+-----+-----+-----+
| Charset | Description | Default collation | Maxlen |
+-----+-----+-----+-----+
| big5 | Big5 Traditional Chinese | big5_chinese_ci | 2 |
| dec8 | DEC West European | dec8_swedish_ci | 1 |
| cp850 | DOS West European | cp850_general_ci | 1 |
| hp8 | HP West European | hp8_english_ci | 1 |
| koi8r | KOI8-R Relcom Russian | koi8r_general_ci | 1 |
| latin1 | cp1252 West European | latin1_swedish_ci | 1 |
| latin2 | ISO 8859-2 Central European | latin2_general_ci | 1 |
...

```

To use a `WHERE` clause with `SHOW CHARACTER SET`, you would refer to those column names. As an example, the following statement displays information about character sets for which the default collation contains the string '`japanese`':

```

mysql> SHOW CHARACTER SET WHERE `Default collation` LIKE '%japanese%';
+-----+-----+-----+-----+
| Charset | Description | Default collation | Maxlen |
+-----+-----+-----+-----+
| ujis | EUC-JP Japanese | ujis_japanese_ci | 3 |
| sjis | Shift-JIS Japanese | sjis_japanese_ci | 2 |
| cp932 | SJIS for Windows Japanese | cp932_japanese_ci | 2 |
| eucjpms | UJIS for Windows Japanese | eucjpms_japanese_ci | 3 |

```

This statement displays the multibyte character sets:

```

mysql> SHOW CHARACTER SET WHERE Maxlen > 1;
+-----+-----+-----+-----+
| Charset | Description | Default collation | Maxlen |
+-----+-----+-----+-----+
| big5 | Big5 Traditional Chinese | big5_chinese_ci | 2 |
| cp932 | SJIS for Windows Japanese | cp932_japanese_ci | 2 |
| eucjpms | UJIS for Windows Japanese | eucjpms_japanese_ci | 3 |

```

euckr	EUC-KR Korean	euckr_korean_ci	2
gb18030	China National Standard GB18030	gb18030_chinese_ci	4
gb2312	GB2312 Simplified Chinese	gb2312_chinese_ci	2
gbk	GBK Simplified Chinese	gbk_chinese_ci	2
sjis	Shift-JIS Japanese	sjis_japanese_ci	2
ucs2	UCS-2 Unicode	ucs2_general_ci	2
ujis	EUC-JP Japanese	ujis_japanese_ci	3

---

29.19.2 Obtaining Parent Event Information .....	4968
29.20 Restrictions on Performance Schema .....	4969

The MySQL Performance Schema is a feature for monitoring MySQL Server execution at a low level. The Performance Schema has these characteristics:

- The Performance Schema provides a way to inspect internal execution of the server at runtime. It is implemented using the `PERFORMANCE_SCHEMA` storage engine and the `performance_schema` database. The Performance Schema focuses primarily on performance data. This differs from `INFORMATION_SCHEMA`, which serves for inspection of metadata.
- The Performance Schema monitors server events. An “event” is anything the server does that takes time and has been instrumented so that timing information can be collected. In general, an event could be a function call, a wait for the operating system, a stage of an SQL statement execution such as parsing or sorting, or an entire statement or group of statements. Event collection provides access to information about synchronization calls (such as for mutexes) file and table I/O, table locks, and so forth for the server and for several storage engines.
- Performance Schema events are distinct from events written to the server’s binary log (which describe data modifications) and Event Scheduler events (which are a type of stored program).
- Performance Schema events are specific to a given instance of the MySQL Server. Performance Schema tables are considered local to the server, and changes to them are not replicated or written to the binary log.
- Current events are available, as well as event histories and summaries. This enables you to determine how many times instrumented activities were performed and how much time they took. Event information is available to show the activities of specific threads, or activity associated with particular objects such as a mutex or file.
- The `PERFORMANCE_SCHEMA` storage engine collects event data using “instrumentation points” in server source code.
- Collected events are stored in tables in the `performance_schema` database. These tables can be queried using `SELECT` statements like other tables.
- Performance Schema configuration can be modified dynamically by updating tables in the `performance_schema` database through SQL statements. Configuration changes affect data collection immediately.
- Tables in the Performance Schema are in-memory tables that use no persistent on-disk storage. The contents are repopulated beginning at server startup and discarded at server shutdown.
- Monitoring is available on all platforms supported by MySQL.

Some limitations might apply: The types of timers might vary per platform. Instruments that apply to storage engines might not be implemented for all storage engines. Instrumentation of each third-party engine is the responsibility of the engine maintainer. See also [Section 29.20, “Restrictions on Performance Schema”](#).

- Data collection is implemented by modifying the server source code to add instrumentation. There are no separate threads associated with the Performance Schema, unlike other features such as replication or the Event Scheduler.

The Performance Schema is intended to provide access to useful information about server execution while having minimal impact on server performance. The implementation follows these design goals:

- Activating the Performance Schema causes no changes in server behavior. For example, it does not cause thread scheduling to change, and it does not cause query execution plans (as shown by `EXPLAIN`) to change.

- Server monitoring occurs continuously and unobtrusively with very little overhead. Activating the Performance Schema does not make the server unusable.
- The parser is unchanged. There are no new keywords or statements.
- Execution of server code proceeds normally even if the Performance Schema fails internally.
- When there is a choice between performing processing during event collection initially or during event retrieval later, priority is given to making collection faster. This is because collection is ongoing whereas retrieval is on demand and might never happen at all.
- Most Performance Schema tables have indexes, which gives the optimizer access to execution plans other than full table scans. For more information, see [Section 10.2.4, “Optimizing Performance Schema Queries”](#).
- It is easy to add new instrumentation points.
- Instrumentation is versioned. If the instrumentation implementation changes, previously instrumented code continues to work. This benefits developers of third-party plugins because it is not necessary to upgrade each plugin to stay synchronized with the latest Performance Schema changes.

#### Note

The MySQL `sys` schema is a set of objects that provides convenient access to data collected by the Performance Schema. The `sys` schema is installed by default. For usage instructions, see [Chapter 30, MySQL sys Schema](#).

## 29.1 Performance Schema Quick Start

This section briefly introduces the Performance Schema with examples that show how to use it. For additional examples, see [Section 29.19, “Using the Performance Schema to Diagnose Problems”](#).

The Performance Schema is enabled by default. To enable or disable it explicitly, start the server with the `performance_schema` variable set to an appropriate value. For example, use these lines in the server `my.cnf` file:

```
[mysqld]
performance_schema=ON
```

When the server starts, it sees `performance_schema` and attempts to initialize the Performance Schema. To verify successful initialization, use this statement:

```
mysql> SHOW VARIABLES LIKE 'performance_schema';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| performance_schema | ON |
+-----+-----+
```

A value of `ON` means that the Performance Schema initialized successfully and is ready for use. A value of `OFF` means that some error occurred. Check the server error log for information about what went wrong.

The Performance Schema is implemented as a storage engine, so you can see it listed in the output from the Information Schema `ENGINES` table or the `SHOW ENGINES` statement:

```
mysql> SELECT * FROM INFORMATION_SCHEMA.ENGINES
 WHERE ENGINE='PERFORMANCE_SCHEMA'\G
***** 1. row *****
 ENGINE: PERFORMANCE_SCHEMA
 SUPPORT: YES
 COMMENT: Performance Schema
TRANSACTIONS: NO
 XA: NO
 SAVEPOINTS: NO
```

```
mysql> SHOW ENGINES\G
...
 Engine: PERFORMANCE_SCHEMA
 Support: YES
 Comment: Performance Schema
Transactions: NO
 XA: NO
 Savepoints: NO
...
```

The `PERFORMANCE_SCHEMA` storage engine operates on tables in the `performance_schema` database. You can make `performance_schema` the default database so that references to its tables need not be qualified with the database name:

```
mysql> USE performance_schema;
```

Performance Schema tables are stored in the `performance_schema` database. Information about the structure of this database and its tables can be obtained, as for any other database, by selecting from the `INFORMATION_SCHEMA` database or by using `SHOW` statements. For example, use either of these statements to see what Performance Schema tables exist:

```
mysql> SELECT TABLE_NAME FROM INFORMATION_SCHEMA.TABLES
 WHERE TABLE_SCHEMA = 'performance_schema';
+-----+
| TABLE_NAME
+-----+
| accounts
| cond_instances
...
| events_stages_current
| events_stages_history
| events_stages_history_long
| events_stages_summary_by_account_by_event_name
| events_stages_summary_by_host_by_event_name
| events_stages_summary_by_thread_by_event_name
| events_stages_summary_by_user_by_event_name
| events_stages_summary_global_by_event_name
| events_statements_current
| events_statements_history
| events_statements_history_long
...
| file_instances
| file_summary_by_event_name
| file_summary_by_instance
| host_cache
| hosts
| memory_summary_by_account_by_event_name
| memory_summary_by_host_by_event_name
| memory_summary_by_thread_by_event_name
| memory_summary_by_user_by_event_name
| memory_summary_global_by_event_name
| metadata_locks
| mutex_instances
| objects_summary_global_by_type
| performance_timers
| replication_connection_configuration
| replication_connection_status
| replication_applier_configuration
| replication_applier_status
| replication_applier_status_by_coordinator
| replication_applier_status_by_worker
| rwlock_instances
| session_account_connect_attrs
| session_connect_attrs
| setup_actors
| setup_consumers
| setup_instruments
| setup_objects
| socket_instances
| socket_summary_by_event_name
```

```

| socket_summary_by_instance
| table_handles
| table_io_waits_summary_by_index_usage
| table_io_waits_summary_by_table
| table_lock_waits_summary_by_table
| threads
| users
+-----+
mysql> SHOW TABLES FROM performance_schema;
+-----+
| Tables_in_performance_schema
+-----+
| accounts
| cond_instances
| events_stages_current
| events_stages_history
| events_stages_history_long
| ...

```

The number of Performance Schema tables increases over time as implementation of additional instrumentation proceeds.

The name of the `performance_schema` database is lowercase, as are the names of tables within it. Queries should specify the names in lowercase.

To see the structure of individual tables, use `SHOW CREATE TABLE`:

```

mysql> SHOW CREATE TABLE performance_schema.setup_consumers\G
***** 1. row *****
 Table: setup_consumers
Create Table: CREATE TABLE `setup_consumers` (
 `NAME` varchar(64) NOT NULL,
 `ENABLED` enum('YES','NO') NOT NULL,
 PRIMARY KEY (`NAME`)
) ENGINE=PERFORMANCE_SCHEMA DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_0900_ai_ci

```

Table structure is also available by selecting from tables such as `INFORMATION_SCHEMA.COLUMNS` or by using statements such as `SHOW COLUMNS`.

Tables in the `performance_schema` database can be grouped according to the type of information in them: Current events, event histories and summaries, object instances, and setup (configuration) information. The following examples illustrate a few uses for these tables. For detailed information about the tables in each group, see [Section 29.12, “Performance Schema Table Descriptions”](#).

Initially, not all instruments and consumers are enabled, so the performance schema does not collect all events. To turn all of these on and enable event timing, execute two statements (the row counts may differ depending on MySQL version):

```

mysql> UPDATE performance_schema.setup_instruments
 SET ENABLED = 'YES', TIMED = 'YES';
Query OK, 560 rows affected (0.04 sec)
mysql> UPDATE performance_schema.setup_consumers
 SET ENABLED = 'YES';
Query OK, 10 rows affected (0.00 sec)

```

To see what the server is doing at the moment, examine the `events_waits_current` table. It contains one row per thread showing each thread's most recent monitored event:

```

mysql> SELECT *
 FROM performance_schema.events_waits_current\G
***** 1. row *****
 THREAD_ID: 0
 EVENT_ID: 5523
END_EVENT_ID: 5523
 EVENT_NAME: wait/synch/mutex/mysys/THR_LOCK::mutex
 SOURCE: thr_lock.c:525
 TIMER_START: 201660494489586
 TIMER_END: 201660494576112

```

```

 TIMER_WAIT: 86526
 SPINS: NULL
 OBJECT_SCHEMA: NULL
 OBJECT_NAME: NULL
 INDEX_NAME: NULL
 OBJECT_TYPE: NULL
OBJECT_INSTANCE_BEGIN: 142270668
 NESTING_EVENT_ID: NULL
 NESTING_EVENT_TYPE: NULL
 OPERATION: lock
 NUMBER_OF_BYTES: NULL
 FLAGS: 0
...

```

This event indicates that thread 0 was waiting for 86,526 picoseconds to acquire a lock on `THR_LOCK::mutex`, a mutex in the `mysys` subsystem. The first few columns provide the following information:

- The ID columns indicate which thread the event comes from and the event number.
- `EVENT_NAME` indicates what was instrumented and `SOURCE` indicates which source file contains the instrumented code.
- The timer columns show when the event started and stopped and how long it took. If an event is still in progress, the `TIMER_END` and `TIMER_WAIT` values are `NULL`. Timer values are approximate and expressed in picoseconds. For information about timers and event time collection, see [Section 29.4.1, “Performance Schema Event Timing”](#).

The history tables contain the same kind of rows as the current-events table but have more rows and show what the server has been doing “recently” rather than “currently.” The `events_waits_history` and `events_waits_history_long` tables contain the most recent 10 events per thread and most recent 10,000 events, respectively. For example, to see information for recent events produced by thread 13, do this:

```

mysql> SELECT EVENT_ID, EVENT_NAME, TIMER_WAIT
 FROM performance_schema.events_waits_history
 WHERE THREAD_ID = 13
 ORDER BY EVENT_ID;
+-----+-----+-----+
| EVENT_ID | EVENT_NAME | TIMER_WAIT |
+-----+-----+-----+
| 86 | wait/synch/mutex/mysys/THR_LOCK::mutex | 686322 |
| 87 | wait/synch/mutex/mysys/THR_LOCK_malloc | 320535 |
| 88 | wait/synch/mutex/mysys/THR_LOCK_malloc | 339390 |
| 89 | wait/synch/mutex/mysys/THR_LOCK_malloc | 377100 |
| 90 | wait/synch/mutex/sql/LOCK_plugin | 614673 |
| 91 | wait/synch/mutex/sql/LOCK_open | 659925 |
| 92 | wait/synch/mutex/sql/THD::LOCK_thd_data | 494001 |
| 93 | wait/synch/mutex/mysys/THR_LOCK_malloc | 222489 |
| 94 | wait/synch/mutex/mysys/THR_LOCK_malloc | 214947 |
| 95 | wait/synch/mutex/mysys/LOCK_alarm | 312993 |
+-----+-----+-----+

```

As new events are added to a history table, older events are discarded if the table is full.

Summary tables provide aggregated information for all events over time. The tables in this group summarize event data in different ways. To see which instruments have been executed the most times or have taken the most wait time, sort the `events_waits_summary_global_by_event_name` table on the `COUNT_STAR` or `SUM_TIMER_WAIT` column, which correspond to a `COUNT(*)` or `SUM(TIMER_WAIT)` value, respectively, calculated over all events:

```

mysql> SELECT EVENT_NAME, COUNT_STAR
 FROM performance_schema.events_waits_summary_global_by_event_name
 ORDER BY COUNT_STAR DESC LIMIT 10;
+-----+-----+
| EVENT_NAME | COUNT_STAR |
+-----+-----+
| wait/synch/mutex/mysys/THR_LOCK_malloc | 6419 |
+-----+-----+

```

```

| wait/io/file/sql/FRM | 452 |
| wait/synch/mutex/sql/LOCK_plugin | 337 |
| wait/synch/mutex/mysys/THR_LOCK_open | 187 |
| wait/synch/mutex/mysys/LOCK_alarm | 147 |
| wait/synch/mutex/sql/THD::LOCK_thd_data | 115 |
| wait/io/file/myisam/kfile | 102 |
| wait/synch/mutex/sql/LOCK_global_system_variables | 89 |
| wait/synch/mutex/mysys/THR_LOCK::mutex | 89 |
| wait/synch/mutex/sql/LOCK_open | 88 |
+-----+-----+-----+-----+-----+-----+-----+
mysql> SELECT EVENT_NAME, SUM_TIMER_WAIT
 FROM performance_schema.events_waits_summary_global_by_event_name
 ORDER BY SUM_TIMER_WAIT DESC LIMIT 10;
+-----+-----+
| EVENT_NAME | SUM_TIMER_WAIT |
+-----+-----+
| wait/io/file/sql/MYSQL_LOG | 1599816582 |
| wait/synch/mutex/mysys/THR_LOCK_malloc | 1530083250 |
| wait/io/file/sql/binlog_index | 1385291934 |
| wait/io/file/sql/FRM | 1292823243 |
| wait/io/file/myisam/kfile | 411193611 |
| wait/io/file/myisam/dfile | 322401645 |
| wait/synch/mutex/mysys/LOCK_alarm | 145126935 |
| wait/io/file/sql/casetest | 104324715 |
| wait/synch/mutex/sql/LOCK_plugin | 86027823 |
| wait/io/file/sql/pid | 72591750 |
+-----+-----+

```

These results show that the `THR_LOCK_malloc` mutex is “hot,” both in terms of how often it is used and amount of time that threads wait attempting to acquire it.

### Note

The `THR_LOCK_malloc` mutex is used only in debug builds. In production builds it is not hot because it is nonexistent.

Instance tables document what types of objects are instrumented. An instrumented object, when used by the server, produces an event. These tables provide event names and explanatory notes or status information. For example, the `file_instances` table lists instances of instruments for file I/O operations and their associated files:

```

mysql> SELECT *
 FROM performance_schema.file_instances\G
***** 1. row *****
FILE_NAME: /opt/mysql-log/60500/binlog.000007
EVENT_NAME: wait/io/file/sql/binlog
OPEN_COUNT: 0
***** 2. row *****
FILE_NAME: /opt/mysql/60500/data/mysql/tables_priv.MYI
EVENT_NAME: wait/io/file/myisam/kfile
OPEN_COUNT: 1
***** 3. row *****
FILE_NAME: /opt/mysql/60500/data/mysql/columns_priv.MYI
EVENT_NAME: wait/io/file/myisam/kfile
OPEN_COUNT: 1
...

```

Setup tables are used to configure and display monitoring characteristics. For example, `setup_instruments` lists the set of instruments for which events can be collected and shows which of them are enabled:

```

mysql> SELECT NAME, ENABLED, TIMED
 FROM performance_schema.setup_instruments;
+-----+-----+-----+
| NAME | ENABLED | TIMED |
+-----+-----+-----+
| ... | | |
| stage/sql/end | NO | NO |
| stage/sql/executing | NO | NO |
+-----+-----+-----+

```

stage/sql/init	NO	NO	
stage/sql/insert	NO	NO	
...			
statement/sql/load	YES	YES	
statement/sql/grant	YES	YES	
statement/sql/check	YES	YES	
statement/sql/flush	YES	YES	
...			
wait/synch/mutex/sql/LOCK_global_read_lock	YES	YES	
wait/synch/mutex/sql/LOCK_global_system_variables	YES	YES	
wait/synch/mutex/sql/LOCK_lock_db	YES	YES	
wait/synch/mutex/sql/LOCK_manager	YES	YES	
...			
wait/synch/rwlock/sql/LOCK_grant	YES	YES	
wait/synch/rwlock/sql/LOGGER::LOCK_logger	YES	YES	
wait/synch/rwlock/sql/LOCK_sys_init_connect	YES	YES	
wait/synch/rwlock/sql/LOCK_sys_init_slave	YES	YES	
...			
wait/io/file/sql/binlog	YES	YES	
wait/io/file/sql/binlog_index	YES	YES	
wait/io/file/sql/casetest	YES	YES	
wait/io/file/sql/dbopt	YES	YES	
...			

To understand how to interpret instrument names, see [Section 29.6, “Performance Schema Instrument Naming Conventions”](#).

To control whether events are collected for an instrument, set its `ENABLED` value to `YES` or `NO`. For example:

```
mysql> UPDATE performance_schema.setup_instruments
 SET ENABLED = 'NO'
 WHERE NAME = 'wait/synch/mutex/sql/LOCK_mysql_create_db';
```

The Performance Schema uses collected events to update tables in the `performance_schema` database, which act as “consumers” of event information. The `setup_consumers` table lists the available consumers and which are enabled:

```
mysql> SELECT * FROM performance_schema.setup_consumers;
+-----+-----+
| NAME | ENABLED |
+-----+-----+
| events_stages_current | NO |
| events_stages_history | NO |
| events_stages_history_long | NO |
| events_statements_cpu | NO |
| events_statements_current | YES |
| events_statements_history | YES |
| events_statements_history_long | NO |
| events_transactions_current | YES |
| events_transactions_history | YES |
| events_transactions_history_long | NO |
| events_waits_current | NO |
| events_waits_history | NO |
| events_waits_history_long | NO |
| global_instrumentation | YES |
| thread_instrumentation | YES |
| statements_digest | YES |
+-----+-----+
```

To control whether the Performance Schema maintains a consumer as a destination for event information, set its `ENABLED` value.

For more information about the setup tables and how to use them to control event collection, see [Section 29.4.2, “Performance Schema Event Filtering”](#).

There are some miscellaneous tables that do not fall into any of the previous groups. For example, `performance_timers` lists the available event timers and their characteristics. For information about timers, see [Section 29.4.1, “Performance Schema Event Timing”](#).

## 29.2 Performance Schema Build Configuration

The Performance Schema is mandatory and always compiled in. It is possible to exclude certain parts of the Performance Schema instrumentation. For example, to exclude stage and statement instrumentation, do this:

```
$> cmake . \
 -DDISABLE_PSI_STAGE=1 \
 -DDISABLE_PSI_STATEMENT=1
```

For more information, see the descriptions of the `DISABLE_PSI_XXX` CMake options in [Section 2.8.7, “MySQL Source-Configuration Options”](#).

If you install MySQL over a previous installation that was configured without the Performance Schema (or with an older version of the Performance Schema that has missing or out-of-date tables). One indication of this issue is the presence of messages such as the following in the error log:

```
[ERROR] Native table 'performance_schema'.events_waits_history
has the wrong structure
[ERROR] Native table 'performance_schema'.events_waits_history_long
has the wrong structure
...
```

To correct that problem, perform the MySQL upgrade procedure. See [Chapter 3, Upgrading MySQL](#).

Because the Performance Schema is configured into the server at build time, a row for `PERFORMANCE_SCHEMA` appears in the output from `SHOW ENGINES`. This means that the Performance Schema is available, not that it is enabled. To enable it, you must do so at server startup, as described in the next section.

## 29.3 Performance Schema Startup Configuration

To use the MySQL Performance Schema, it must be enabled at server startup to enable event collection to occur.

The Performance Schema is enabled by default. To enable or disable it explicitly, start the server with the `performance_schema` variable set to an appropriate value. For example, use these lines in the server `my.cnf` file:

```
[mysqld]
performance_schema=ON
```

If the server is unable to allocate any internal buffer during Performance Schema initialization, the Performance Schema disables itself and sets `performance_schema` to `OFF`, and the server runs without instrumentation.

The Performance Schema also permits instrument and consumer configuration at server startup.

To control an instrument at server startup, use an option of this form:

```
--performance-schema-instrument='instrument_name=value'
```

Here, `instrument_name` is an instrument name such as `wait/synch/mutex/sql/LOCK_open`, and `value` is one of these values:

- `OFF`, `FALSE`, or `0`: Disable the instrument
- `ON`, `TRUE`, or `1`: Enable and time the instrument
- `COUNTED`: Enable and count (rather than time) the instrument

Each `--performance-schema-instrument` option can specify only one instrument name, but multiple instances of the option can be given to configure multiple instruments. In addition, patterns are permitted in instrument names to configure instruments that match the pattern. To configure all condition synchronization instruments as enabled and counted, use this option:

```
--performance-schema-instrument='wait/synch/cond/=%COUNTED'
```

To disable all instruments, use this option:

```
--performance-schema-instrument='=%OFF'
```

Exception: The `memory/performance_schema/%` instruments are built in and cannot be disabled at startup.

Longer instrument name strings take precedence over shorter pattern names, regardless of order. For information about specifying patterns to select instruments, see [Section 29.4.9, “Naming Instruments or Consumers for Filtering Operations”](#).

An unrecognized instrument name is ignored. It is possible that a plugin installed later may create the instrument, at which time the name is recognized and configured.

To control a consumer at server startup, use an option of this form:

```
--performance-schema-consumer=consumer_name=value
```

Here, `consumer_name` is a consumer name such as `events_waits_history`, and `value` is one of these values:

- `OFF`, `FALSE`, or `0`: Do not collect events for the consumer
- `ON`, `TRUE`, or `1`: Collect events for the consumer

For example, to enable the `events_waits_history` consumer, use this option:

```
--performance-schema-consumer-events-waits-history=ON
```

The permitted consumer names can be found by examining the `setup_consumers` table. Patterns are not permitted. Consumer names in the `setup_consumers` table use underscores, but for consumers set at startup, dashes and underscores within the name are equivalent.

The Performance Schema includes several system variables that provide configuration information:

```
mysql> SHOW VARIABLES LIKE 'perf%';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| performance_schema | ON |
| performance_schema_accounts_size | 100 |
| performance_schema_digests_size | 200 |
| performance_schema_events_stages_history_long_size | 10000 |
| performance_schema_events_stages_history_size | 10 |
| performance_schema_events_statements_history_long_size | 10000 |
| performance_schema_events_statements_history_size | 10 |
| performance_schema_events_waits_history_long_size | 10000 |
| performance_schema_events_waits_history_size | 10 |
| performance_schema_hosts_size | 100 |
| performance_schema_max_cond_classes | 80 |
| performance_schema_max_cond_instances | 1000 |
...

```

The `performance_schema` variable is `ON` or `OFF` to indicate whether the Performance Schema is enabled or disabled. The other variables indicate table sizes (number of rows) or memory allocation values.

#### Note

With the Performance Schema enabled, the number of Performance Schema instances affects the server memory footprint, perhaps to a large extent. The Performance Schema autoscales many parameters to use memory only as required; see [Section 29.17, “The Performance Schema Memory-Allocation Model”](#).

To change the value of Performance Schema system variables, set them at server startup. For example, put the following lines in a `my.cnf` file to change the sizes of the history tables for wait events:

```
[mysqld]
performance_schema
performance_schema_events_waits_history_size=20
performance_schema_events_waits_history_long_size=15000
```

The Performance Schema automatically sizes the values of several of its parameters at server startup if they are not set explicitly. For example, it sizes the parameters that control the sizes of the events waits tables this way. The Performance Schema allocates memory incrementally, scaling its memory use to actual server load, instead of allocating all the memory it needs during server startup. Consequently, many sizing parameters need not be set at all. To see which parameters are autosized or autoscaled, use `mysqld --verbose --help` and examine the option descriptions, or see [Section 29.15, “Performance Schema System Variables”](#).

For each autosized parameter that is not set at server startup, the Performance Schema determines how to set its value based on the value of the following system values, which are considered as “hints” about how you have configured your MySQL server:

```
max_connections
open_files_limit
table_definition_cache
table_open_cache
```

To override autosizing or autoscaling for a given parameter, set it to a value other than `-1` at startup. In this case, the Performance Schema assigns it the specified value.

At runtime, `SHOW VARIABLES` displays the actual values that autosized parameters were set to. Autoscaled parameters display with a value of `-1`.

If the Performance Schema is disabled, its autosized and autoscaled parameters remain set to `-1` and `SHOW VARIABLES` displays `-1`.

## 29.4 Performance Schema Runtime Configuration

Specific Performance Schema features can be enabled at runtime to control which types of event collection occur.

Performance Schema setup tables contain information about monitoring configuration:

```
mysql> SELECT TABLE_NAME FROM INFORMATION_SCHEMA.TABLES
 WHERE TABLE_SCHEMA = 'performance_schema'
 AND TABLE_NAME LIKE 'setup%';
+-----+
| TABLE_NAME |
+-----+
| setup_actors |
| setup_consumers |
| setup_instruments |
| setup_objects |
| setup_threads |
+-----+
```

You can examine the contents of these tables to obtain information about Performance Schema monitoring characteristics. If you have the `UPDATE` privilege, you can change Performance Schema operation by modifying setup tables to affect how monitoring occurs. For additional details about these tables, see [Section 29.12.2, “Performance Schema Setup Tables”](#).

The `setup_instruments` and `setup_consumers` tables list the instruments for which events can be collected and the types of consumers for which event information actually is collected, respectively. Other setup tables enable further modification of the monitoring configuration. [Section 29.4.2, “Performance Schema Event Filtering”](#), discusses how you can modify these tables to affect event collection.

If there are Performance Schema configuration changes that must be made at runtime using SQL statements and you would like these changes to take effect each time the server starts, put the statements in a file and start the server with the `init_file` system variable set to name the file. This strategy can also be useful if you have multiple monitoring configurations, each tailored to produce a different kind of monitoring, such as casual server health monitoring, incident investigation, application behavior troubleshooting, and so forth. Put the statements for each monitoring configuration into their own file and specify the appropriate file as the `init_file` value when you start the server.

## 29.4.1 Performance Schema Event Timing

Events are collected by means of instrumentation added to the server source code. Instruments time events, which is how the Performance Schema provides an idea of how long events take. It is also possible to configure instruments not to collect timing information. This section discusses the available timers and their characteristics, and how timing values are represented in events.

### Performance Schema Timers

Performance Schema timers vary in precision and amount of overhead. To see what timers are available and their characteristics, check the `performance_timers` table:

TIMER_NAME	TIMER_FREQUENCY	TIMER_RESOLUTION	TIMER_OVERHEAD
CYCLE	2389029850	1	72
NANOSECOND	1000000000	1	112
MICROSECOND	1000000	1	136
MILLISECOND	1036	1	168
THREAD_CPU	339101694	1	798

If the values associated with a given timer name are `NULL`, that timer is not supported on your platform.

The columns have these meanings:

- The `TIMER_NAME` column shows the names of the available timers. `CYCLE` refers to the timer that is based on the CPU (processor) cycle counter.
- `TIMER_FREQUENCY` indicates the number of timer units per second. For a cycle timer, the frequency is generally related to the CPU speed. The value shown was obtained on a system with a 2.4GHz processor. The other timers are based on fixed fractions of seconds.
- `TIMER_RESOLUTION` indicates the number of timer units by which timer values increase at a time. If a timer has a resolution of 10, its value increases by 10 each time.
- `TIMER_OVERHEAD` is the minimal number of cycles of overhead to obtain one timing with the given timer. The overhead per event is twice the value displayed because the timer is invoked at the beginning and end of the event.

The Performance Schema assigns timers as follows:

- The wait timer uses `CYCLE`.
- The idle, stage, statement, and transaction timers use `NANOSECOND` on platforms where the `NANOSECOND` timer is available, `MICROSECOND` otherwise.

At server startup, the Performance Schema verifies that assumptions made at build time about timer assignments are correct, and displays a warning if a timer is not available.

To time wait events, the most important criterion is to reduce overhead, at the possible expense of the timer accuracy, so using the `CYCLE` timer is the best.

The time a statement (or stage) takes to execute is in general orders of magnitude larger than the time it takes to execute a single wait. To time statements, the most important criterion is to have an accurate

measure, which is not affected by changes in processor frequency, so using a timer which is not based on cycles is the best. The default timer for statements is `NANOSECOND`. The extra “overhead” compared to the `CYCLE` timer is not significant, because the overhead caused by calling a timer twice (once when the statement starts, once when it ends) is orders of magnitude less compared to the CPU time used to execute the statement itself. Using the `CYCLE` timer has no benefit here, only drawbacks.

The precision offered by the cycle counter depends on processor speed. If the processor runs at 1 GHz (one billion cycles/second) or higher, the cycle counter delivers sub-nanosecond precision. Using the cycle counter is much cheaper than getting the actual time of day. For example, the standard `gettimeofday()` function can take hundreds of cycles, which is an unacceptable overhead for data gathering that may occur thousands or millions of times per second.

Cycle counters also have disadvantages:

- End users expect to see timings in wall-clock units, such as fractions of a second. Converting from cycles to fractions of seconds can be expensive. For this reason, the conversion is a quick and fairly rough multiplication operation.
- Processor cycle rate might change, such as when a laptop goes into power-saving mode or when a CPU slows down to reduce heat generation. If a processor's cycle rate fluctuates, conversion from cycles to real-time units is subject to error.
- Cycle counters might be unreliable or unavailable depending on the processor or the operating system. For example, on Pentiums, the instruction is `RDTSC` (an assembly-language rather than a C instruction) and it is theoretically possible for the operating system to prevent user-mode programs from using it.
- Some processor details related to out-of-order execution or multiprocessor synchronization might cause the counter to seem fast or slow by up to 1000 cycles.

MySQL works with cycle counters on x386 (Windows, macOS, Linux, Solaris, and other Unix flavors), PowerPC, and IA-64.

## Performance Schema Timer Representation in Events

Rows in Performance Schema tables that store current events and historical events have three columns to represent timing information: `TIMER_START` and `TIMER_END` indicate when an event started and finished, and `TIMER_WAIT` indicates event duration.

The `setup_instruments` table has an `ENABLED` column to indicate the instruments for which to collect events. The table also has a `TIMED` column to indicate which instruments are timed. If an instrument is not enabled, it produces no events. If an enabled instrument is not timed, events produced by the instrument have `NULL` for the `TIMER_START`, `TIMER_END`, and `TIMER_WAIT` timer values. This in turn causes those values to be ignored when calculating aggregate time values in summary tables (sum, minimum, maximum, and average).

Internally, times within events are stored in units given by the timer in effect when event timing begins. For display when events are retrieved from Performance Schema tables, times are shown in picoseconds (trillionths of a second) to normalize them to a standard unit, regardless of which timer is selected.

The timer baseline (“time zero”) occurs at Performance Schema initialization during server startup. `TIMER_START` and `TIMER_END` values in events represent picoseconds since the baseline. `TIMER_WAIT` values are durations in picoseconds.

Picosecond values in events are approximate. Their accuracy is subject to the usual forms of error associated with conversion from one unit to another. If the `CYCLE` timer is used and the processor rate varies, there might be drift. For these reasons, it is not reasonable to look at the `TIMER_START` value for an event as an accurate measure of time elapsed since server startup. On the other hand, it is reasonable to use `TIMER_START` or `TIMER_WAIT` values in `ORDER BY` clauses to order events by start time or duration.

The choice of picoseconds in events rather than a value such as microseconds has a performance basis. One implementation goal was to show results in a uniform time unit, regardless of the timer. In an ideal world this time unit would look like a wall-clock unit and be reasonably precise; in other words, microseconds. But to convert cycles or nanoseconds to microseconds, it would be necessary to perform a division for every instrumentation. Division is expensive on many platforms. Multiplication is not expensive, so that is what is used. Therefore, the time unit is an integer multiple of the highest possible `TIMER_FREQUENCY` value, using a multiplier large enough to ensure that there is no major precision loss. The result is that the time unit is “picoseconds.” This precision is spurious, but the decision enables overhead to be minimized.

While a wait, stage, statement, or transaction event is executing, the respective current-event tables display current-event timing information:

```
events_waits_current
events_stages_current
events_statements_current
events_transactions_current
```

To make it possible to determine how long a not-yet-completed event has been running, the timer columns are set as follows:

- `TIMER_START` is populated.
- `TIMER_END` is populated with the current timer value.
- `TIMER_WAIT` is populated with the time elapsed so far (`TIMER_END - TIMER_START`).

Events that have not yet completed have an `END_EVENT_ID` value of `NULL`. To assess time elapsed so far for an event, use the `TIMER_WAIT` column. Therefore, to identify events that have not yet completed and have taken longer than `N` picoseconds thus far, monitoring applications can use this expression in queries:

```
WHERE END_EVENT_ID IS NULL AND TIMER_WAIT > N
```

Event identification as just described assumes that the corresponding instruments have `ENABLED` and `TIMED` set to `YES` and that the relevant consumers are enabled.

## 29.4.2 Performance Schema Event Filtering

Events are processed in a producer/consumer fashion:

- Instrumented code is the source for events and produces events to be collected. The `setup_instruments` table lists the instruments for which events can be collected, whether they are enabled, and (for enabled instruments) whether to collect timing information:

```
mysql> SELECT NAME, ENABLED, TIMED
 FROM performance_schema.setup_instruments;
+-----+-----+-----+
| NAME | ENABLED | TIMED |
+-----+-----+-----+
| ... | | |
| wait/synch/mutex/sql/LOCK_global_read_lock | YES | YES |
| wait/synch/mutex/sql/LOCK_global_system_variables | YES | YES |
| wait/synch/mutex/sql/LOCK_lock_db | YES | YES |
| wait/synch/mutex/sql/LOCK_manager | YES | YES |
| ... | | |
```

The `setup_instruments` table provides the most basic form of control over event production. To further refine event production based on the type of object or thread being monitored, other tables may be used as described in [Section 29.4.3, “Event Pre-Filtering”](#).

- Performance Schema tables are the destinations for events and consume events. The `setup_consumers` table lists the types of consumers to which event information can be sent and whether they are enabled:

```
mysql> SELECT * FROM performance_schema.setup_consumers;
+-----+-----+
| NAME | ENABLED |
+-----+-----+
| events_stages_current | NO |
| events_stages_history | NO |
| events_stages_history_long | NO |
| events_statements_cpu | NO |
| events_statements_current | YES |
| events_statements_history | YES |
| events_statements_history_long | NO |
| events_transactions_current | YES |
| events_transactions_history | YES |
| events_transactions_history_long | NO |
| events_waits_current | NO |
| events_waits_history | NO |
| events_waits_history_long | NO |
| global_instrumentation | YES |
| thread_instrumentation | YES |
| statements_digest | YES |
+-----+-----+
```

Filtering can be done at different stages of performance monitoring:

- **Pre-filtering.** This is done by modifying Performance Schema configuration so that only certain types of events are collected from producers, and collected events update only certain consumers. To do this, enable or disable instruments or consumers. Pre-filtering is done by the Performance Schema and has a global effect that applies to all users.

Reasons to use pre-filtering:

- To reduce overhead. Performance Schema overhead should be minimal even with all instruments enabled, but perhaps you want to reduce it further. Or you do not care about timing events and want to disable the timing code to eliminate timing overhead.
- To avoid filling the current-events or history tables with events in which you have no interest. Pre-filtering leaves more “room” in these tables for instances of rows for enabled instrument types. If you enable only file instruments with pre-filtering, no rows are collected for nonfile instruments. With post-filtering, nonfile events are collected, leaving fewer rows for file events.
- To avoid maintaining some kinds of event tables. If you disable a consumer, the server does not spend time maintaining destinations for that consumer. For example, if you do not care about event histories, you can disable the history table consumers to improve performance.
- **Post-filtering.** This involves the use of `WHERE` clauses in queries that select information from Performance Schema tables, to specify which of the available events you want to see. Post-filtering is performed on a per-user basis because individual users select which of the available events are of interest.

Reasons to use post-filtering:

- To avoid making decisions for individual users about which event information is of interest.
- To use the Performance Schema to investigate a performance issue when the restrictions to impose using pre-filtering are not known in advance.

The following sections provide more detail about pre-filtering and provide guidelines for naming instruments or consumers in filtering operations. For information about writing queries to retrieve information (post-filtering), see [Section 29.5, “Performance Schema Queries”](#).

### 29.4.3 Event Pre-Filtering

Pre-filtering is done by the Performance Schema and has a global effect that applies to all users. Pre-filtering can be applied to either the producer or consumer stage of event processing:

- To configure pre-filtering at the producer stage, several tables can be used:
  - `setup_instruments` indicates which instruments are available. An instrument disabled in this table produces no events regardless of the contents of the other production-related setup tables. An instrument enabled in this table is permitted to produce events, subject to the contents of the other tables.
  - `setup_objects` controls whether the Performance Schema monitors particular table and stored program objects.
  - `threads` indicates whether monitoring is enabled for each server thread.
  - `setup_actors` determines the initial monitoring state for new foreground threads.
- To configure pre-filtering at the consumer stage, modify the `setup_consumers` table. This determines the destinations to which events are sent. `setup_consumers` also implicitly affects event production. If a given event is not sent to any destination (that is, it is never consumed), the Performance Schema does not produce it.

Modifications to any of these tables affect monitoring immediately, with the exception that modifications to the `setup_actors` table affect only foreground threads created subsequent to the modification, not existing threads.

When you change the monitoring configuration, the Performance Schema does not flush the history tables. Events already collected remain in the current-events and history tables until displaced by newer events. If you disable instruments, you might need to wait a while before events for them are displaced by newer events of interest. Alternatively, use `TRUNCATE TABLE` to empty the history tables.

After making instrumentation changes, you might want to truncate the summary tables. Generally, the effect is to reset the summary columns to 0 or `NULL`, not to remove rows. This enables you to clear collected values and restart aggregation. That might be useful, for example, after you have made a runtime configuration change. Exceptions to this truncation behavior are noted in individual summary table sections.

The following sections describe how to use specific tables to control Performance Schema pre-filtering.

#### 29.4.4 Pre-Filtering by Instrument

The `setup_instruments` table lists the available instruments:

NAME	ENABLED	TIMED
stage/sql/end	NO	NO
stage/sql/executing	NO	NO
stage/sql/init	NO	NO
stage/sql/insert	NO	NO
...		
statement/sql/load	YES	YES
statement/sql/grant	YES	YES
statement/sql/check	YES	YES
statement/sql/flush	YES	YES
...		
wait/synch/mutex/sql/LOCK_global_read_lock	YES	YES
wait/synch/mutex/sql/LOCK_global_system_variables	YES	YES
wait/synch/mutex/sql/LOCK_lock_db	YES	YES
wait/synch/mutex/sql/LOCK_manager	YES	YES
...		
wait/synch/rwlock/sql/LOCK_grant	YES	YES
wait/synch/rwlock/sql/LOGGER::LOCK_logger	YES	YES
wait/synch/rwlock/sql/LOCK_sys_init_connect	YES	YES

wait/synch/rwlock/sql/LOCK_sys_init_slave	YES	YES	
...			
wait/io/file/sql/binlog	YES	YES	
wait/io/file/sql/binlog_index	YES	YES	
wait/io/file/sql/casetest	YES	YES	
wait/io/file/sql/dbopt	YES	YES	
...			

To control whether an instrument is enabled, set its `ENABLED` column to `YES` or `NO`. To configure whether to collect timing information for an enabled instrument, set its `TIMED` value to `YES` or `NO`. Setting the `TIMED` column affects Performance Schema table contents as described in [Section 29.4.1, “Performance Schema Event Timing”](#).

Modifications to most `setup_instruments` rows affect monitoring immediately. For some instruments, modifications are effective only at server startup; changing them at runtime has no effect. This affects primarily mutexes, conditions, and rwlocks in the server, although there may be other instruments for which this is true.

The `setup_instruments` table provides the most basic form of control over event production. To further refine event production based on the type of object or thread being monitored, other tables may be used as described in [Section 29.4.3, “Event Pre-Filtering”](#).

The following examples demonstrate possible operations on the `setup_instruments` table. These changes, like other pre-filtering operations, affect all users. Some of these queries use the `LIKE` operator and a pattern match instrument names. For additional information about specifying patterns to select instruments, see [Section 29.4.9, “Naming Instruments or Consumers for Filtering Operations”](#).

- Disable all instruments:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'NO';
```

Now no events are collected.

- Disable all file instruments, adding them to the current set of disabled instruments:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'NO'
WHERE NAME LIKE 'wait/io/file/%';
```

- Disable only file instruments, enable all other instruments:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = IF(NAME LIKE 'wait/io/file/%', 'NO', 'YES');
```

- Enable all but those instruments in the `mysys` library:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = CASE WHEN NAME LIKE '%/mysys/%' THEN 'YES' ELSE 'NO' END;
```

- Disable a specific instrument:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'NO'
WHERE NAME = 'wait/synch/mutex/mysys/TMPDIR_mutex';
```

- To toggle the state of an instrument, “flip” its `ENABLED` value:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = IF(ENABLED = 'YES', 'NO', 'YES')
WHERE NAME = 'wait/synch/mutex/mysys/TMPDIR_mutex';
```

- Disable timing for all events:

```
UPDATE performance_schema.setup_instruments
SET TIMED = 'NO';
```

## 29.4.5 Pre-Filtering by Object

The `setup_objects` table controls whether the Performance Schema monitors particular table and stored program objects. The initial `setup_objects` contents look like this:

OBJECT_TYPE	OBJECT_SCHEMA	OBJECT_NAME	ENABLED	TIMED
EVENT	mysql	%	NO	NO
EVENT	performance_schema	%	NO	NO
EVENT	information_schema	%	NO	NO
EVENT	%	%	YES	YES
FUNCTION	mysql	%	NO	NO
FUNCTION	performance_schema	%	NO	NO
FUNCTION	information_schema	%	NO	NO
FUNCTION	%	%	YES	YES
PROCEDURE	mysql	%	NO	NO
PROCEDURE	performance_schema	%	NO	NO
PROCEDURE	information_schema	%	NO	NO
PROCEDURE	%	%	YES	YES
TABLE	mysql	%	NO	NO
TABLE	performance_schema	%	NO	NO
TABLE	information_schema	%	NO	NO
TABLE	%	%	YES	YES
TRIGGER	mysql	%	NO	NO
TRIGGER	performance_schema	%	NO	NO
TRIGGER	information_schema	%	NO	NO
TRIGGER	%	%	YES	YES

Modifications to the `setup_objects` table affect object monitoring immediately.

The `OBJECT_TYPE` column indicates the type of object to which a row applies. `TABLE` filtering affects table I/O events (`wait/io/table/sql/handler` instrument) and table lock events (`wait/lock/table/sql/handler` instrument).

The `OBJECT_SCHEMA` and `OBJECT_NAME` columns should contain a literal schema or object name, or '`%`' to match any name.

The `ENABLED` column indicates whether matching objects are monitored, and `TIMED` indicates whether to collect timing information. Setting the `TIMED` column affects Performance Schema table contents as described in [Section 29.4.1, “Performance Schema Event Timing”](#).

The effect of the default object configuration is to instrument all objects except those in the `mysql`, `INFORMATION_SCHEMA`, and `performance_schema` databases. (Tables in the `INFORMATION_SCHEMA` database are not instrumented regardless of the contents of `setup_objects`; the row for `information_schema.%` simply makes this default explicit.)

When the Performance Schema checks for a match in `setup_objects`, it tries to find more specific matches first. For rows that match a given `OBJECT_TYPE`, the Performance Schema checks rows in this order:

- Rows with `OBJECT_SCHEMA='literal'` and `OBJECT_NAME='literal'`.
- Rows with `OBJECT_SCHEMA='literal'` and `OBJECT_NAME='%'`.
- Rows with `OBJECT_SCHEMA='%'` and `OBJECT_NAME='%'`.

For example, with a table `db1.t1`, the Performance Schema looks in `TABLE` rows for a match for '`db1`' and '`t1`', then for '`db1`' and '`%`', then for '`%`' and '`%`'. The order in which matching occurs matters because different matching `setup_objects` rows can have different `ENABLED` and `TIMED` values.

For table-related events, the Performance Schema combines the contents of `setup_objects` with `setup_instruments` to determine whether to enable instruments and whether to time enabled instruments:

- For tables that match a row in `setup_objects`, table instruments produce events only if `ENABLED` is `YES` in both `setup_instruments` and `setup_objects`.
- The `TIMED` values in the two tables are combined, so that timing information is collected only when both values are `YES`.

For stored program objects, the Performance Schema takes the `ENABLED` and `TIMED` columns directly from the `setup_objects` row. There is no combining of values with `setup_instruments`.

Suppose that `setup_objects` contains the following `TABLE` rows that apply to `db1`, `db2`, and `db3`:

OBJECT_TYPE	OBJECT_SCHEMA	OBJECT_NAME	ENABLED	TIMED
TABLE	db1	t1	YES	YES
TABLE	db1	t2	NO	NO
TABLE	db2	%	YES	YES
TABLE	db3	%	NO	NO
TABLE	%	%	YES	YES

If an object-related instrument in `setup_instruments` has an `ENABLED` value of `NO`, events for the object are not monitored. If the `ENABLED` value is `YES`, event monitoring occurs according to the `ENABLED` value in the relevant `setup_objects` row:

- `db1.t1` events are monitored
- `db1.t2` events are not monitored
- `db2.t3` events are monitored
- `db3.t4` events are not monitored
- `db4.t5` events are monitored

Similar logic applies for combining the `TIMED` columns from the `setup_instruments` and `setup_objects` tables to determine whether to collect event timing information.

If a persistent table and a temporary table have the same name, matching against `setup_objects` rows occurs the same way for both. It is not possible to enable monitoring for one table but not the other. However, each table is instrumented separately.

## 29.4.6 Pre-Filtering by Thread

The `threads` table contains a row for each server thread. Each row contains information about a thread and indicates whether monitoring is enabled for it. For the Performance Schema to monitor a thread, these things must be true:

- The `thread_instrumentation` consumer in the `setup_consumers` table must be `YES`.
- The `threads.INSTRUMENTED` column must be `YES`.
- Monitoring occurs only for those thread events produced from instruments that are enabled in the `setup_instruments` table.

The `threads` table also indicates for each server thread whether to perform historical event logging. This includes wait, stage, statement, and transaction events and affects logging to these tables:

```
events_waits_history
events_waits_history_long
events_stages_history
events_stages_history_long
events_statements_history
events_statements_history_long
events_transactions_history
events_transactions_history_long
```

For historical event logging to occur, these things must be true:

- The appropriate history-related consumers in the `setup_consumers` table must be enabled. For example, wait event logging in the `events_waits_history` and `events_waits_history_long` tables requires the corresponding `events_waits_history` and `events_waits_history_long` consumers to be `YES`.
- The `threads.HISTORY` column must be `YES`.
- Logging occurs only for those thread events produced from instruments that are enabled in the `setup_instruments` table.

For foreground threads (resulting from client connections), the initial values of the `INSTRUMENTED` and `HISTORY` columns in `threads` table rows are determined by whether the user account associated with a thread matches any row in the `setup_actors` table. The values come from the `ENABLED` and `HISTORY` columns of the matching `setup_actors` table row.

For background threads, there is no associated user. `INSTRUMENTED` and `HISTORY` are `YES` by default and `setup_actors` is not consulted.

The initial `setup_actors` contents look like this:

```
mysql> SELECT * FROM performance_schema.setup_actors;
+-----+-----+-----+-----+
| HOST | USER | ROLE | ENABLED | HISTORY |
+-----+-----+-----+-----+
| % | % | % | YES | YES |
+-----+-----+-----+-----+
```

The `HOST` and `USER` columns should contain a literal host or user name, or '`%`' to match any name.

The `ENABLED` and `HISTORY` columns indicate whether to enable instrumentation and historical event logging for matching threads, subject to the other conditions described previously.

When the Performance Schema checks for a match for each new foreground thread in `setup_actors`, it tries to find more specific matches first, using the `USER` and `HOST` columns (`ROLE` is unused):

- Rows with `USER='literal'` and `HOST='literal'`.
- Rows with `USER='literal'` and `HOST='%'`.
- Rows with `USER='%'` and `HOST='literal'`.
- Rows with `USER='%'` and `HOST='%'`.

The order in which matching occurs matters because different matching `setup_actors` rows can have different `USER` and `HOST` values. This enables instrumenting and historical event logging to be applied selectively per host, user, or account (user and host combination), based on the `ENABLED` and `HISTORY` column values:

- When the best match is a row with `ENABLED=YES`, the `INSTRUMENTED` value for the thread becomes `YES`. When the best match is a row with `HISTORY=YES`, the `HISTORY` value for the thread becomes `YES`.
- When the best match is a row with `ENABLED=NO`, the `INSTRUMENTED` value for the thread becomes `NO`. When the best match is a row with `HISTORY=NO`, the `HISTORY` value for the thread becomes `NO`.
- When no match is found, the `INSTRUMENTED` and `HISTORY` values for the thread become `NO`.

The `ENABLED` and `HISTORY` columns in `setup_actors` rows can be set to `YES` or `NO` independent of one another. This means you can enable instrumentation separately from whether you collect historical events.

By default, monitoring and historical event collection are enabled for all new foreground threads because the `setup_actors` table initially contains a row with '`%`' for both `HOST` and `USER`. To perform more limited matching such as to enable monitoring only for some foreground threads, you must change this row because it matches any connection, and add rows for more specific `HOST`/`USER` combinations.

Suppose that you modify `setup_actors` as follows:

```
UPDATE performance_schema.setup_actors
SET ENABLED = 'NO', HISTORY = 'NO'
WHERE HOST = '%' AND USER = '%';
INSERT INTO performance_schema.setup_actors
(HOST,USER,ROLE,ENABLED,HISTORY)
VALUES('localhost','joe','','YES','YES');
INSERT INTO performance_schema.setup_actors
(HOST,USER,ROLE,ENABLED,HISTORY)
VALUES('hosta.example.com','joe','','YES','NO');
INSERT INTO performance_schema.setup_actors
(HOST,USER,ROLE,ENABLED,HISTORY)
VALUES('%','sam','','NO','YES');
```

The `UPDATE` statement changes the default match to disable instrumentation and historical event collection. The `INSERT` statements add rows for more specific matches.

Now the Performance Schema determines how to set the `INSTRUMENTED` and `HISTORY` values for new connection threads as follows:

- If `joe` connects from the local host, the connection matches the first inserted row. The `INSTRUMENTED` and `HISTORY` values for the thread become `YES`.
- If `joe` connects from `hosta.example.com`, the connection matches the second inserted row. The `INSTRUMENTED` value for the thread becomes `YES` and the `HISTORY` value becomes `NO`.
- If `joe` connects from any other host, there is no match. The `INSTRUMENTED` and `HISTORY` values for the thread become `NO`.
- If `sam` connects from any host, the connection matches the third inserted row. The `INSTRUMENTED` value for the thread becomes `NO` and the `HISTORY` value becomes `YES`.
- For any other connection, the row with `HOST` and `USER` set to '`%`' matches. This row now has `ENABLED` and `HISTORY` set to `NO`, so the `INSTRUMENTED` and `HISTORY` values for the thread become `NO`.

Modifications to the `setup_actors` table affect only foreground threads created subsequent to the modification, not existing threads. To affect existing threads, modify the `INSTRUMENTED` and `HISTORY` columns of `threads` table rows.

## 29.4.7 Pre-Filtering by Consumer

The `setup_consumers` table lists the available consumer types and which are enabled:

```
mysql> SELECT * FROM performance_schema.setup_consumers;
+-----+-----+
| NAME | ENABLED |
+-----+-----+
| events_stages_current | NO |
| events_stages_history | NO |
| events_stages_history_long | NO |
| events_statements_cpu | NO |
| events_statements_current | YES |
| events_statements_history | YES |
| events_statements_history_long | NO |
| events_transactions_current | YES |
| events_transactions_history | YES |
| events_transactions_history_long | NO |
| events_waits_current | NO |
| events_waits_history | NO |
```

events_waits_history_long	NO
global_instrumentation	YES
thread_instrumentation	YES
statements_digest	YES

Modify the `setup_consumers` table to affect pre-filtering at the consumer stage and determine the destinations to which events are sent. To enable or disable a consumer, set its `ENABLED` value to `YES` or `NO`.

Modifications to the `setup_consumers` table affect monitoring immediately.

If you disable a consumer, the server does not spend time maintaining destinations for that consumer. For example, if you do not care about historical event information, disable the history consumers:

```
UPDATE performance_schema.setup_consumers
SET ENABLED = 'NO'
WHERE NAME LIKE '%history%';
```

The consumer settings in the `setup_consumers` table form a hierarchy from higher levels to lower. The following principles apply:

- Destinations associated with a consumer receive no events unless the Performance Schema checks the consumer and the consumer is enabled.
- A consumer is checked only if all consumers it depends on (if any) are enabled.
- If a consumer is not checked, or is checked but is disabled, other consumers that depend on it are not checked.
- Dependent consumers may have their own dependent consumers.
- If an event would not be sent to any destination, the Performance Schema does not produce it.

The following lists describe the available consumer values. For discussion of several representative consumer configurations and their effect on instrumentation, see [Section 29.4.8, “Example Consumer Configurations”](#).

- [Global and Thread Consumers](#)
- [Wait Event Consumers](#)
- [Stage Event Consumers](#)
- [Statement Event Consumers](#)
- [Transaction Event Consumers](#)
- [Statement Digest Consumer](#)

## Global and Thread Consumers

- `global_instrumentation` is the highest level consumer. If `global_instrumentation` is `NO`, it disables global instrumentation. All other settings are lower level and are not checked; it does not matter what they are set to. No global or per thread information is maintained and no individual events are collected in the current-events or event-history tables. If `global_instrumentation` is `YES`, the Performance Schema maintains information for global states and also checks the `thread_instrumentation` consumer.
- `thread_instrumentation` is checked only if `global_instrumentation` is `YES`. Otherwise, if `thread_instrumentation` is `NO`, it disables thread-specific instrumentation and all lower-level settings are ignored. No information is maintained per thread and no individual events are collected in the current-events or event-history tables. If `thread_instrumentation` is `YES`, the Performance Schema maintains thread-specific information and also checks `events_xxx_current` consumers.

## Wait Event Consumers

These consumers require both `global_instrumentation` and `thread_instrumentation` to be `YES` or they are not checked. If checked, they act as follows:

- `events_waits_current`, if `NO`, disables collection of individual wait events in the `events_waits_current` table. If `YES`, it enables wait event collection and the Performance Schema checks the `events_waits_history` and `events_waits_history_long` consumers.
- `events_waits_history` is not checked if `event_waits_current` is `NO`. Otherwise, an `events_waits_history` value of `NO` or `YES` disables or enables collection of wait events in the `events_waits_history` table.
- `events_waits_history_long` is not checked if `event_waits_current` is `NO`. Otherwise, an `events_waits_history_long` value of `NO` or `YES` disables or enables collection of wait events in the `events_waits_history_long` table.

## Stage Event Consumers

These consumers require both `global_instrumentation` and `thread_instrumentation` to be `YES` or they are not checked. If checked, they act as follows:

- `events_stages_current`, if `NO`, disables collection of individual stage events in the `events_stages_current` table. If `YES`, it enables stage event collection and the Performance Schema checks the `events_stages_history` and `events_stages_history_long` consumers.
- `events_stages_history` is not checked if `event_stages_current` is `NO`. Otherwise, an `events_stages_history` value of `NO` or `YES` disables or enables collection of stage events in the `events_stages_history` table.
- `events_stages_history_long` is not checked if `event_stages_current` is `NO`. Otherwise, an `events_stages_history_long` value of `NO` or `YES` disables or enables collection of stage events in the `events_stages_history_long` table.

## Statement Event Consumers

These consumers require both `global_instrumentation` and `thread_instrumentation` to be `YES` or they are not checked. If checked, they act as follows:

- `events_statements_cpu`, if `NO`, disables measurement of `CPU_TIME`. If `YES`, and the instrumentation is enabled and timed, `CPU_TIME` is measured.
- `events_statements_current`, if `NO`, disables collection of individual statement events in the `events_statements_current` table. If `YES`, it enables statement event collection and the Performance Schema checks the `events_statements_history` and `events_statements_history_long` consumers.
- `events_statements_history` is not checked if `events_statements_current` is `NO`. Otherwise, an `events_statements_history` value of `NO` or `YES` disables or enables collection of statement events in the `events_statements_history` table.
- `events_statements_history_long` is not checked if `events_statements_current` is `NO`. Otherwise, an `events_statements_history_long` value of `NO` or `YES` disables or enables collection of statement events in the `events_statements_history_long` table.

## Transaction Event Consumers

These consumers require both `global_instrumentation` and `thread_instrumentation` to be `YES` or they are not checked. If checked, they act as follows:

- `events_transactions_current`, if `NO`, disables collection of individual transaction events in the `events_transactions_current` table. If `YES`, it enables transaction event collection and the Performance Schema checks the `events_transactions_history` and `events_transactions_history_long` consumers.
- `events_transactions_history` is not checked if `events_transactions_current` is `NO`. Otherwise, an `events_transactions_history` value of `NO` or `YES` disables or enables collection of transaction events in the `events_transactions_history` table.
- `events_transactions_history_long` is not checked if `events_transactions_current` is `NO`. Otherwise, an `events_transactions_history_long` value of `NO` or `YES` disables or enables collection of transaction events in the `events_transactions_history_long` table.

## Statement Digest Consumer

The `statements_digest` consumer requires `global_instrumentation` to be `YES` or it is not checked. There is no dependency on the statement event consumers, so you can obtain statistics per digest without having to collect statistics in `events_statements_current`, which is advantageous in terms of overhead. Conversely, you can get detailed statements in `events_statements_current` without digests (the `DIGEST` and `DIGEST_TEXT` columns are `NULL` in this case).

For more information about statement digesting, see [Section 29.10, “Performance Schema Statement Digests and Sampling”](#).

### 29.4.8 Example Consumer Configurations

The consumer settings in the `setup_consumers` table form a hierarchy from higher levels to lower. The following discussion describes how consumers work, showing specific configurations and their effects as consumer settings are enabled progressively from high to low. The consumer values shown are representative. The general principles described here apply to other consumer values that may be available.

The configuration descriptions occur in order of increasing functionality and overhead. If you do not need the information provided by enabling lower-level settings, disable them so that the Performance Schema executes less code on your behalf and there is less information to sift through.

The `setup_consumers` table contains the following hierarchy of values:

```
global_instrumentation
thread_instrumentation
 events_waits_current
 events_waits_history
 events_waits_history_long
events_stages_current
 events_stages_history
 events_stages_history_long
events_statements_current
 events_statements_history
 events_statements_history_long
events_transactions_current
 events_transactions_history
 events_transactions_history_long
statements_digest
```

#### Note

In the consumer hierarchy, the consumers for waits, stages, statements, and transactions are all at the same level. This differs from the event nesting hierarchy, for which wait events nest within stage events, which nest within statement events, which nest within transaction events.

If a given consumer setting is `NO`, the Performance Schema disables the instrumentation associated with the consumer and ignores all lower-level settings. If a given setting is `YES`, the Performance

Schema enables the instrumentation associated with it and checks the settings at the next lowest level. For a description of the rules for each consumer, see [Section 29.4.7, “Pre-Filtering by Consumer”](#).

For example, if `global_instrumentation` is enabled, `thread_instrumentation` is checked. If `thread_instrumentation` is enabled, the `events_xxx_current` consumers are checked. If of these `events_waits_current` is enabled, `events_waits_history` and `events_waits_history_long` are checked.

Each of the following configuration descriptions indicates which setup elements the Performance Schema checks and which output tables it maintains (that is, for which tables it collects information).

- [No Instrumentation](#)
- [Global Instrumentation Only](#)
- [Global and Thread Instrumentation Only](#)
- [Global, Thread, and Current-Event Instrumentation](#)
- [Global, Thread, Current-Event, and Event-History instrumentation](#)

## No Instrumentation

Server configuration state:

```
mysql> SELECT * FROM performance_schema.setup_consumers;
+-----+-----+
| NAME | ENABLED |
+-----+-----+
| global_instrumentation | NO |
...
+-----+-----+
```

In this configuration, nothing is instrumented.

Setup elements checked:

- Table `setup_consumers`, consumer `global_instrumentation`

Output tables maintained:

- None

## Global Instrumentation Only

Server configuration state:

```
mysql> SELECT * FROM performance_schema.setup_consumers;
+-----+-----+
| NAME | ENABLED |
+-----+-----+
| global_instrumentation | YES |
| thread_instrumentation | NO |
...
+-----+-----+
```

In this configuration, instrumentation is maintained only for global states. Per-thread instrumentation is disabled.

Additional setup elements checked, relative to the preceding configuration:

- Table `setup_consumers`, consumer `thread_instrumentation`
- Table `setup_instruments`
- Table `setup_objects`

Additional output tables maintained, relative to the preceding configuration:

- `mutex_instances`
- `rwlock_instances`
- `cond_instances`
- `file_instances`
- `users`
- `hosts`
- `accounts`
- `socket_summary_by_event_name`
- `file_summary_by_instance`
- `file_summary_by_event_name`
- `objects_summary_global_by_type`
- `memory_summary_global_by_event_name`
- `table_lock_waits_summary_by_table`
- `table_io_waits_summary_by_index_usage`
- `table_io_waits_summary_by_table`
- `events_waits_summary_by_instance`
- `events_waits_summary_global_by_event_name`
- `events_stages_summary_global_by_event_name`
- `events_statements_summary_global_by_event_name`
- `events_transactions_summary_global_by_event_name`

## Global and Thread Instrumentation Only

Server configuration state:

```
mysql> SELECT * FROM performance_schema.setup_consumers;
+-----+-----+
| NAME | ENABLED |
+-----+-----+
| global_instrumentation | YES |
| thread_instrumentation | YES |
| events_waits_current | NO |
...
| events_stages_current | NO |
...
| events_statements_current | NO |
...
| events_transactions_current | NO |
...
+-----+-----+
```

In this configuration, instrumentation is maintained globally and per thread. No individual events are collected in the current-events or event-history tables.

Additional setup elements checked, relative to the preceding configuration:

- Table `setup_consumers`, consumers `events_xxx_current`, where `xxx` is `waits`, `stages`, `statements`, `transactions`
- Table `setup_actors`
- Column `threads.instrumented`

Additional output tables maintained, relative to the preceding configuration:

- `events_xxx_summary_by_yyy_by_event_name`, where `xxx` is `waits`, `stages`, `statements`, `transactions`; and `yyy` is `thread`, `user`, `host`, `account`

## Global, Thread, and Current-Event Instrumentation

Server configuration state:

```
mysql> SELECT * FROM performance_schema.setup_consumers;
+-----+-----+
| NAME | ENABLED |
+-----+-----+
| global_instrumentation | YES |
| thread_instrumentation | YES |
| events_waits_current | YES |
| events_waits_history | NO |
| events_waits_history_long | NO |
| events_stages_current | YES |
| events_stages_history | NO |
| events_stages_history_long | NO |
| events_statements_current | YES |
| events_statements_history | NO |
| events_statements_history_long | NO |
| events_transactions_current | YES |
| events_transactions_history | NO |
| events_transactions_history_long | NO |
| ...
+-----+-----+
```

In this configuration, instrumentation is maintained globally and per thread. Individual events are collected in the current-events table, but not in the event-history tables.

Additional setup elements checked, relative to the preceding configuration:

- Consumers `events_xxx_history`, where `xxx` is `waits`, `stages`, `statements`, `transactions`
- Consumers `events_xxx_history_long`, where `xxx` is `waits`, `stages`, `statements`, `transactions`

Additional output tables maintained, relative to the preceding configuration:

- `events_xxx_current`, where `xxx` is `waits`, `stages`, `statements`, `transactions`

## Global, Thread, Current-Event, and Event-History instrumentation

The preceding configuration collects no event history because the `events_xxx_history` and `events_xxx_history_long` consumers are disabled. Those consumers can be enabled separately or together to collect event history per thread, globally, or both.

This configuration collects event history per thread, but not globally:

```
mysql> SELECT * FROM performance_schema.setup_consumers;
+-----+-----+
| NAME | ENABLED |
+-----+-----+
| global_instrumentation | YES |
| thread_instrumentation | YES |
| events_waits_current | YES |
| events_waits_history | YES |
| events_waits_history_long | NO |
+-----+-----+
```

## Example Consumer Configurations

events_stages_current	YES
events_stages_history	YES
events_stages_history_long	NO
events_statements_current	YES
events_statements_history	YES
events_statements_history_long	NO
events_transactions_current	YES
events_transactions_history	YES
events_transactions_history_long	NO
...	

Event-history tables maintained for this configuration:

- `events_xxx_history`, where `xxx` is `waits`, `stages`, `statements`, `transactions`

This configuration collects event history globally, but not per thread:

```
mysql> SELECT * FROM performance_schema.setup_consumers;
```

NAME	ENABLED
global_instrumentation	YES
thread_instrumentation	YES
events_waits_current	YES
events_waits_history	NO
events_waits_history_long	YES
events_stages_current	YES
events_stages_history	NO
events_stages_history_long	YES
events_statements_current	YES
events_statements_history	NO
events_statements_history_long	YES
events_transactions_current	YES
events_transactions_history	NO
events_transactions_history_long	YES
...	

Event-history tables maintained for this configuration:

- `events_xxx_history_long`, where `xxx` is `waits`, `stages`, `statements`, `transactions`

This configuration collects event history per thread and globally:

```
mysql> SELECT * FROM performance_schema.setup_consumers;
```

NAME	ENABLED
global_instrumentation	YES
thread_instrumentation	YES
events_waits_current	YES
events_waits_history	YES
events_waits_history_long	YES
events_stages_current	YES
events_stages_history	YES
events_stages_history_long	YES
events_statements_current	YES
events_statements_history	YES
events_statements_history_long	YES
events_transactions_current	YES
events_transactions_history	YES
events_transactions_history_long	YES
...	

Event-history tables maintained for this configuration:

- `events_xxx_history`, where `xxx` is `waits`, `stages`, `statements`, `transactions`
- `events_xxx_history_long`, where `xxx` is `waits`, `stages`, `statements`, `transactions`

## 29.4.9 Naming Instruments or Consumers for Filtering Operations

Names given for filtering operations can be as specific or general as required. To indicate a single instrument or consumer, specify its name in full:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'NO'
WHERE NAME = 'wait/synch/mutex/myisammrg/MYRG_INFO::mutex';

UPDATE performance_schema.setup_consumers
SET ENABLED = 'NO'
WHERE NAME = 'events_waits_current';
```

To specify a group of instruments or consumers, use a pattern that matches the group members:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'NO'
WHERE NAME LIKE 'wait/synch/mutex/%';

UPDATE performance_schema.setup_consumers
SET ENABLED = 'NO'
WHERE NAME LIKE '%history%';
```

If you use a pattern, it should be chosen so that it matches all the items of interest and no others. For example, to select all file I/O instruments, it is better to use a pattern that includes the entire instrument name prefix:

```
... WHERE NAME LIKE 'wait/io/file/%';
```

A pattern of '`%/file/%`' matches other instruments that have an element of '`/file/`' anywhere in the name. Even less suitable is the pattern '`%file%`' because it matches instruments with '`file`' anywhere in the name, such as `wait/synch/mutex/innodb/file_open_mutex`.

To check which instrument or consumer names a pattern matches, perform a simple test:

```
SELECT NAME FROM performance_schema.setup_instruments
WHERE NAME LIKE 'pattern';

SELECT NAME FROM performance_schema.setup_consumers
WHERE NAME LIKE 'pattern';
```

For information about the types of names that are supported, see [Section 29.6, “Performance Schema Instrument Naming Conventions”](#).

## 29.4.10 Determining What Is Instrumented

It is always possible to determine what instruments the Performance Schema includes by checking the `setup_instruments` table. For example, to see what file-related events are instrumented for the `InnoDB` storage engine, use this query:

```
mysql> SELECT NAME, ENABLED, TIMED
 FROM performance_schema.setup_instruments
 WHERE NAME LIKE 'wait/io/file/innodb%';
+-----+-----+-----+
| NAME | ENABLED | TIMED |
+-----+-----+-----+
| wait/io/file/innodb/innodb_tablespace_open_file | YES | YES |
| wait/io/file/innodb/innodb_data_file | YES | YES |
| wait/io/file/innodb/innodb_log_file | YES | YES |
| wait/io/file/innodb/innodb_temp_file | YES | YES |
| wait/io/file/innodb/innodb_arch_file | YES | YES |
| wait/io/file/innodb/innodb_clone_file | YES | YES |
+-----+-----+-----+
```

An exhaustive description of precisely what is instrumented is not given in this documentation, for several reasons:

- What is instrumented is the server code. Changes to this code occur often, which also affects the set of instruments.
- It is not practical to list all the instruments because there are hundreds of them.
- As described earlier, it is possible to find out by querying the `setup_instruments` table. This information is always up to date for your version of MySQL, also includes instrumentation for instrumented plugins you might have installed that are not part of the core server, and can be used by automated tools.

## 29.5 Performance Schema Queries

Pre-filtering limits which event information is collected and is independent of any particular user. By contrast, post-filtering is performed by individual users through the use of queries with appropriate `WHERE` clauses that restrict what event information to select from the events available after pre-filtering has been applied.

In [Section 29.4.3, “Event Pre-Filtering”](#), an example showed how to pre-filter for file instruments. If the event tables contain both file and nonfile information, post-filtering is another way to see information only for file events. Add a `WHERE` clause to queries to restrict event selection appropriately:

```
mysql> SELECT THREAD_ID, NUMBER_OF_BYTES
 FROM performance_schema.events_waits_history
 WHERE EVENT_NAME LIKE 'wait/io/file/%'
 AND NUMBER_OF_BYTES IS NOT NULL;
+-----+-----+
| THREAD_ID | NUMBER_OF_BYTES |
+-----+-----+
| 11 | 66 |
| 11 | 47 |
| 11 | 139 |
| 5 | 24 |
| 5 | 834 |
+-----+-----+
```

Most Performance Schema tables have indexes, which gives the optimizer access to execution plans other than full table scans. These indexes also improve performance for related objects, such as `sys` schema views that use those tables. For more information, see [Section 10.2.4, “Optimizing Performance Schema Queries”](#).

## 29.6 Performance Schema Instrument Naming Conventions

An instrument name consists of a sequence of elements separated by `' / '` characters. Example names:

```
wait/io/file/myisam/log
wait/io/file/mysys/charset
wait/lock/table/sql/handler
wait/synch/cond/mysys/COND_alarm
wait/synch/cond/sql/BINLOG::update_cond
wait/synch/mutex/mysys/BITMAP_mutex
wait/synch/mutex/sql/LOCK_delete
wait/synch/rwlock/sql/Query_cache_query::lock
stage/sql/closing_tables
stage/sql/Sorting_result
statement/com/Execute
statement/com/Query
statement/sql/create_table
statement/sql/lock_tables
errors
```

The instrument name space has a tree-like structure. The elements of an instrument name from left to right provide a progression from more general to more specific. The number of elements a name has depends on the type of instrument.

The interpretation of a given element in a name depends on the elements to the left of it. For example, `myisam` appears in both of the following names, but `myisam` in the first name is related to file I/O, whereas in the second it is related to a synchronization instrument:

```
wait/io/file/myisam/log
wait/synch/cond/myisam/MI_SORT_INFO::cond
```

Instrument names consist of a prefix with a structure defined by the Performance Schema implementation and a suffix defined by the developer implementing the instrument code. The top-level element of an instrument prefix indicates the type of instrument. This element also determines which event timer in the `performance_timers` table applies to the instrument. For the prefix part of instrument names, the top level indicates the type of instrument.

The suffix part of instrument names comes from the code for the instruments themselves. Suffixes may include levels such as these:

- A name for the major element (a server module such as `myisam`, `innodb`, `mysys`, or `sql`) or a plugin name.
- The name of a variable in the code, in the form `XXX` (a global variable) or `CCC::MMM` (a member `MMM` in class `CCC`). Examples: `COND_thread_cache`, `THR_LOCK_myisam`, `BINLOG::LOCK_index`.
- [Top-Level Instrument Elements](#)
- [Idle Instrument Elements](#)
- [Error Instrument Elements](#)
- [Memory Instrument Elements](#)
- [Stage Instrument Elements](#)
- [Statement Instrument Elements](#)
- [Thread Instrument Elements](#)
- [Wait Instrument Elements](#)

## Top-Level Instrument Elements

- `idle`: An instrumented idle event. This instrument has no further elements.
- `error`: An instrumented error event. This instrument has no further elements.
- `memory`: An instrumented memory event.
- `stage`: An instrumented stage event.
- `statement`: An instrumented statement event.
- `transaction`: An instrumented transaction event. This instrument has no further elements.
- `wait`: An instrumented wait event.

## Idle Instrument Elements

The `idle` instrument is used for idle events, which The Performance Schema generates as discussed in the description of the `socket_instances.STATE` column in [Section 29.12.3.5, “The socket\\_instances Table”](#).

## Error Instrument Elements

The `error` instrument indicates whether to collect information for server errors and warnings. This instrument is enabled by default. The `TIMED` column for the `error` row in the `setup_instruments` table is inapplicable because timing information is not collected.

## Memory Instrument Elements

Memory instrumentation is enabled by default. Memory instrumentation can be enabled or disabled at startup, or dynamically at runtime by updating the `ENABLED` column of the relevant instruments in the `setup_instruments` table. Memory instruments have names of the form `memory/code_area/instrument_name` where `code_area` is a value such as `sql` or `myisam`, and `instrument_name` is the instrument detail.

Instruments named with the prefix `memory/performance_schema/` expose how much memory is allocated for internal buffers in the Performance Schema. The `memory/performance_schema/` instruments are built in, always enabled, and cannot be disabled at startup or runtime. Built-in memory instruments are displayed only in the `memory_summary_global_by_event_name` table. For more information, see [Section 29.17, “The Performance Schema Memory-Allocation Model”](#).

## Stage Instrument Elements

Stage instruments have names of the form `stage/code_area/stage_name`, where `code_area` is a value such as `sql` or `myisam`, and `stage_name` indicates the stage of statement processing, such as `Sorting result` or `Sending data`. Stages correspond to the thread states displayed by `SHOW PROCESSLIST` or that are visible in the Information Schema `PROCESSLIST` table.

## Statement Instrument Elements

- `statement/abstract/*`: An abstract instrument for statement operations. Abstract instruments are used during the early stages of statement classification before the exact statement type is known, then changed to a more specific statement instrument when the type is known. For a description of this process, see [Section 29.12.6, “Performance Schema Statement Event Tables”](#).
- `statement/com`: An instrumented command operation. These have names corresponding to `COM_xxx` operations (see the `mysql_com.h` header file and `sql/sql_parse.cc`). For example, the `statement/com/Connect` and `statement/com/Init_DB` instruments correspond to the `COM_CONNECT` and `COM_INIT_DB` commands.
- `statement/scheduler/event`: A single instrument to track all events executed by the Event Scheduler. This instrument comes into play when a scheduled event begins executing.
- `statement/sp`: An instrumented internal instruction executed by a stored program. For example, the `statement/sp/cfetch` and `statement/sp/freturn` instruments are used cursor fetch and function return instructions.
- `statement/sql`: An instrumented SQL statement operation. For example, the `statement/sql/create_db` and `statement/sql/select` instruments are used for `CREATE DATABASE` and `SELECT` statements.

## Thread Instrument Elements

Instrumented threads are displayed in the `setup_threads` table, which exposes thread class names and attributes.

Thread instruments begin with `thread` (for example, `thread/sql/parser_service` or `thread/performance_schema/setup`).

The names of thread instruments for `ndbcluster` plugin threads begin with `thread/ndbcluster/`; for more information about these, see [ndbcluster Plugin Threads](#).

## Wait Instrument Elements

- `wait/io`  
An instrumented I/O operation.

- [wait/io/file](#)

An instrumented file I/O operation. For files, the wait is the time waiting for the file operation to complete (for example, a call to `fwrite()`). Due to caching, the physical file I/O on the disk might not happen within this call.

- [wait/io/socket](#)

An instrumented socket operation. Socket instruments have names of the form `wait/io/socket/sql/socket_type`. The server has a listening socket for each network protocol that it supports. The instruments associated with listening sockets for TCP/IP or Unix socket file connections have a `socket_type` value of `server_tcpip_socket` or `server_unix_socket`, respectively. When a listening socket detects a connection, the server transfers the connection to a new socket managed by a separate thread. The instrument for the new connection thread has a `socket_type` value of `client_connection`.

- [wait/io/table](#)

An instrumented table I/O operation. These include row-level accesses to persistent base tables or temporary tables. Operations that affect rows are fetch, insert, update, and delete. For a view, waits are associated with base tables referenced by the view.

Unlike most waits, a table I/O wait can include other waits. For example, table I/O might include file I/O or memory operations. Thus, `events_waits_current` for a table I/O wait usually has two rows. For more information, see [Section 29.8, “Performance Schema Atom and Molecule Events”](#).

Some row operations might cause multiple table I/O waits. For example, an insert might activate a trigger that causes an update.

- [wait/lock](#)

An instrumented lock operation.

- [wait/lock/table](#)

An instrumented table lock operation.

- [wait/lock/metadata/sql/mdl](#)

An instrumented metadata lock operation.

- [wait/synch](#)

An instrumented synchronization object. For synchronization objects, the `TIMER_WAIT` time includes the amount of time blocked while attempting to acquire a lock on the object, if any.

- [wait/synch/cond](#)

A condition is used by one thread to signal to other threads that something they were waiting for has happened. If a single thread was waiting for a condition, it can wake up and proceed with its execution. If several threads were waiting, they can all wake up and compete for the resource for which they were waiting.

- [wait/synch/mutex](#)

A mutual exclusion object used to permit access to a resource (such as a section of executable code) while preventing other threads from accessing the resource.

- [wait/synch/prlock](#)

A priority `rwlock` lock object.

- [wait/synch/rwlock](#)

A plain [read/write lock](#) object used to lock a specific variable for access while preventing its use by other threads. A shared read lock can be acquired simultaneously by multiple threads. An exclusive write lock can be acquired by only one thread at a time.

- [wait/synch/sxlock](#)

A shared-exclusive (SX) lock is a type of [rwlock](#) lock object that provides write access to a common resource while permitting inconsistent reads by other threads. [sxlocks](#) optimize concurrency and improve scalability for read-write workloads.

## 29.7 Performance Schema Status Monitoring

There are several status variables associated with the Performance Schema:

Variable_name	Value
Performance_schema_accounts_lost	0
Performance_schema_cond_classes_lost	0
Performance_schema_cond_instances_lost	0
Performance_schema_digest_lost	0
Performance_schema_file_classes_lost	0
Performance_schema_file_handles_lost	0
Performance_schema_file_instances_lost	0
Performance_schema_hosts_lost	0
Performance_schema_locker_lost	0
Performance_schema_memory_classes_lost	0
Performance_schema_metadata_lock_lost	0
Performance_schema_mutex_classes_lost	0
Performance_schema_mutex_instances_lost	0
Performance_schema_nested_statement_lost	0
Performance_schema_program_lost	0
Performance_schema_rwlock_classes_lost	0
Performance_schema_rwlock_instances_lost	0
Performance_schema_session_connect_attrs_lost	0
Performance_schema_socket_classes_lost	0
Performance_schema_socket_instances_lost	0
Performance_schema_stage_classes_lost	0
Performance_schema_statement_classes_lost	0
Performance_schema_table_handles_lost	0
Performance_schema_table_instances_lost	0
Performance_schema_thread_classes_lost	0
Performance_schema_thread_instances_lost	0
Performance_schema_users_lost	0

The Performance Schema status variables provide information about instrumentation that could not be loaded or created due to memory constraints. Names for these variables have several forms:

- [Performance\\_schema\\_xxx\\_classes\\_lost](#) indicates how many instruments of type [xxx](#) could not be loaded.
- [Performance\\_schema\\_xxx\\_instances\\_lost](#) indicates how many instances of object type [xxx](#) could not be created.
- [Performance\\_schema\\_xxx\\_handles\\_lost](#) indicates how many instances of object type [xxx](#) could not be opened.
- [Performance\\_schema\\_locker\\_lost](#) indicates how many events are “lost” or not recorded.

For example, if a mutex is instrumented in the server source but the server cannot allocate memory for the instrumentation at runtime, it increments [Performance\\_schema\\_mutex\\_classes\\_lost](#).

The mutex still functions as a synchronization object (that is, the server continues to function normally), but performance data for it is not collected. If the instrument can be allocated, it can be used for initializing instrumented mutex instances. For a singleton mutex such as a global mutex, there is only one instance. Other mutexes have an instance per connection, or per page in various caches and data buffers, so the number of instances varies over time. Increasing the maximum number of connections or the maximum size of some buffers increases the maximum number of instances that might be allocated at once. If the server cannot create a given instrumented mutex instance, it increments `Performance_schema_mutex_instances_lost`.

Suppose that the following conditions hold:

- The server was started with the `--performance_schema_max_mutex_classes=200` option and thus has room for 200 mutex instruments.
- 150 mutex instruments have been loaded already.
- The plugin named `plugin_a` contains 40 mutex instruments.
- The plugin named `plugin_b` contains 20 mutex instruments.

The server allocates mutex instruments for the plugins depending on how many they need and how many are available, as illustrated by the following sequence of statements:

```
INSTALL PLUGIN plugin_a;
```

The server now has  $150+40 = 190$  mutex instruments.

```
UNINSTALL PLUGIN plugin_a;
```

The server still has 190 instruments. All the historical data generated by the plugin code is still available, but new events for the instruments are not collected.

```
INSTALL PLUGIN plugin_a;
```

The server detects that the 40 instruments are already defined, so no new instruments are created, and previously assigned internal memory buffers are reused. The server still has 190 instruments.

```
INSTALL PLUGIN plugin_b;
```

The server has room for  $200-190 = 10$  instruments (in this case, mutex classes), and sees that the plugin contains 20 new instruments. 10 instruments are loaded, and 10 are discarded or “lost.” The `Performance_schema_mutex_classes_lost` indicates the number of instruments (mutex classes) lost:

```
mysql> SHOW STATUS LIKE "perf%mutex_classes_lost";
+-----+-----+
| Variable_name | Value |
+-----+-----+
| Performance_schema_mutex_classes_lost | 10 |
+-----+-----+
1 row in set (0.10 sec)
```

The instrumentation still works and collects (partial) data for `plugin_b`.

When the server cannot create a mutex instrument, these results occur:

- No row for the instrument is inserted into the `setup_instruments` table.
- `Performance_schema_mutex_classes_lost` increases by 1.
- `Performance_schema_mutex_instances_lost` does not change. (When the mutex instrument is not created, it cannot be used to create instrumented mutex instances later.)

The pattern just described applies to all types of instruments, not just mutexes.

A value of `Performance_schema_mutex_classes_lost` greater than 0 can happen in two cases:

- To save a few bytes of memory, you start the server with `--performance_schema_max_mutex_classes=N`, where `N` is less than the default value. The default value is chosen to be sufficient to load all the plugins provided in the MySQL distribution, but this can be reduced if some plugins are never loaded. For example, you might choose not to load some of the storage engines in the distribution.
- You load a third-party plugin that is instrumented for the Performance Schema but do not allow for the plugin's instrumentation memory requirements when you start the server. Because it comes from a third party, the instrument memory consumption of this engine is not accounted for in the default value chosen for `performance_schema_max_mutex_classes`.

If the server has insufficient resources for the plugin's instruments and you do not explicitly allocate more using `--performance_schema_max_mutex_classes=N`, loading the plugin leads to starvation of instruments.

If the value chosen for `performance_schema_max_mutex_classes` is too small, no error is reported in the error log and there is no failure at runtime. However, the content of the tables in the `performance_schema` database misses events. The `Performance_schema_mutex_classes_lost` status variable is the only visible sign to indicate that some events were dropped internally due to failure to create instruments.

If an instrument is not lost, it is known to the Performance Schema, and is used when instrumenting instances. For example, `wait/synch/mutex/sql/LOCK_delete` is the name of a mutex instrument in the `setup_instruments` table. This single instrument is used when creating a mutex in the code (in `THD::LOCK_delete`) however many instances of the mutex are needed as the server runs. In this case, `LOCK_delete` is a mutex that is per connection (`THD`), so if a server has 1000 connections, there are 1000 threads, and 1000 instrumented `LOCK_delete` mutex instances (`THD::LOCK_delete`).

If the server does not have room for all these 1000 instrumented mutexes (instances), some mutexes are created with instrumentation, and some are created without instrumentation. If the server can create only 800 instances, 200 instances are lost. The server continues to run, but increments `Performance_schema_mutex_instances_lost` by 200 to indicate that instances could not be created.

A value of `Performance_schema_mutex_instances_lost` greater than 0 can happen when the code initializes more mutexes at runtime than were allocated for `--performance_schema_max_mutex_instances=N`.

The bottom line is that if `SHOW STATUS LIKE 'perf%'` says that nothing was lost (all values are zero), the Performance Schema data is accurate and can be relied upon. If something was lost, the data is incomplete, and the Performance Schema could not record everything given the insufficient amount of memory it was given to use. In this case, the specific `Performance_schema_xxx_lost` variable indicates the problem area.

It might be appropriate in some cases to cause deliberate instrument starvation. For example, if you do not care about performance data for file I/O, you can start the server with all Performance Schema parameters related to file I/O set to 0. No memory is allocated for file-related classes, instances, or handles, and all file events are lost.

Use `SHOW ENGINE PERFORMANCE_SCHEMA STATUS` to inspect the internal operation of the Performance Schema code:

```
mysql> SHOW ENGINE PERFORMANCE_SCHEMA STATUS\G
...
***** 3. row *****
Type: performance_schema
Name: events_waits_history.size
Status: 76
***** 4. row *****
Type: performance_schema
Name: events_waits_history.count
```

```

Status: 10000
***** 5. row *****
 Type: performance_schema
 Name: events_waits_history.memory
Status: 760000
...
***** 57. row *****
 Type: performance_schema
 Name: performance_schema.memory
Status: 26459600
...

```

This statement is intended to help the DBA understand the effects that different Performance Schema options have on memory requirements. For a description of the field meanings, see [Section 15.7.7.16, "SHOW ENGINE Statement"](#).

## 29.8 Performance Schema Atom and Molecule Events

For a table I/O event, there are usually two rows in `events_waits_current`, not one. For example, a row fetch might result in rows like this:

Row#	EVENT_NAME	TIMER_START	TIMER_END
1	wait/io/file/myisam/dfile	10001	10002
2	wait/io/table/sql/handler	10000	NULL

The row fetch causes a file read. In the example, the table I/O fetch event started before the file I/O event but has not finished (its `TIMER_END` value is `NULL`). The file I/O event is “nested” within the table I/O event.

This occurs because, unlike other “atomic” wait events such as for mutexes or file I/O, table I/O events are “molecular” and include (overlap with) other events. In `events_waits_current`, the table I/O event usually has two rows:

- One row for the most recent table I/O wait event
- One row for the most recent wait event of any kind

Usually, but not always, the “of any kind” wait event differs from the table I/O event. As each subsidiary event completes, it disappears from `events_waits_current`. At this point, and until the next subsidiary event begins, the table I/O wait is also the most recent wait of any kind.

## 29.9 Performance Schema Tables for Current and Historical Events

For wait, stage, statement, and transaction events, the Performance Schema can monitor and store current events. In addition, when events end, the Performance Schema can store them in history tables. For each event type, the Performance Schema uses three tables for storing current and historical events. The tables have names of the following forms, where `xxx` indicates the event type (`waits, stages, statements, transactions`):

- `events_xxx_current`: The “current events” table stores the current monitored event for each thread (one row per thread).
- `events_xxx_history`: The “recent history” table stores the most recent events that have ended per thread (up to a maximum number of rows per thread).
- `events_xxx_history_long`: The “long history” table stores the most recent events that have ended globally (across all threads, up to a maximum number of rows per table).

The `_current` table for each event type contains one row per thread, so there is no system variable for configuring its maximum size. The Performance Schema autosizes the history tables, or the sizes

can be configured explicitly at server startup using table-specific system variables, as indicated in the sections that describe the individual history tables. Typical autosized values are 10 rows per thread for `_history` tables, and 10,000 rows total for `_history_long` tables.

For each event type, the `_current`, `_history`, and `_history_long` tables have the same columns. The `_current` and `_history` tables have the same indexing. The `_history_long` table has no indexing.

The `_current` tables show what is currently happening within the server. When a current event ends, it is removed from its `_current` table.

The `_history` and `_history_long` tables show what has happened in the recent past. When the history tables become full, old events are discarded as new events are added. Rows expire from the `_history` and `_history_long` tables in different ways because the tables serve different purposes:

- `_history` is meant to investigate individual threads, independently of the global server load.
- `_history_long` is meant to investigate the server globally, not each thread.

The difference between the two types of history tables relates to the data retention policy. Both tables contain the same data when an event is first seen. However, data within each table expires differently over time, so that data might be preserved for a longer or shorter time in each table:

- For `_history`, when the table contains the maximum number of rows for a given thread, the oldest thread row is discarded when a new row for that thread is added.
- For `_history_long`, when the table becomes full, the oldest row is discarded when a new row is added, regardless of which thread generated either row.

When a thread ends, all its rows are discarded from the `_history` table but not from the `_history_long` table.

The following example illustrates the differences in how events are added to and discarded from the two types of history tables. The principles apply equally to all event types. The example is based on these assumptions:

- The Performance Schema is configured to retain 10 rows per thread in the `_history` table and 10,000 rows total in the `_history_long` table.
- Thread A generates 1 event per second.

Thread B generates 100 events per second.

- No other threads are running.

After 5 seconds of execution:

- A and B have generated 5 and 500 events, respectively.
- `_history` contains 5 rows for A and 10 rows for B. Because storage per thread is limited to 10 rows, no rows have been discarded for A, whereas 490 rows have been discarded for B.
- `_history_long` contains 5 rows for A and 500 rows for B. Because the table has a maximum size of 10,000 rows, no rows have been discarded for either thread.

After 5 minutes (300 seconds) of execution:

- A and B have generated 300 and 30,000 events, respectively.
- `_history` contains 10 rows for A and 10 rows for B. Because storage per thread is limited to 10 rows, 290 rows have been discarded for A, whereas 29,990 rows have been discarded for B. Rows for A include data up to 10 seconds old, whereas rows for B include data up to only .1 seconds old.

- `_history_long` contains 10,000 rows. Because A and B together generate 101 events per second, the table contains data up to approximately  $10,000/101 = 99$  seconds old, with a mix of rows approximately 100 to 1 from B as opposed to A.

## 29.10 Performance Schema Statement Digests and Sampling

The MySQL server is capable of maintaining statement digest information. The digesting process converts each SQL statement to normalized form (the statement digest) and computes a SHA-256 hash value (the digest hash value) from the normalized result. Normalization permits statements that are similar to be grouped and summarized to expose information about the types of statements the server is executing and how often they occur. For each digest, a representative statement that produces the digest is stored as a sample. This section describes how statement digesting and sampling occur and how they can be useful.

Digesting occurs in the parser regardless of whether the Performance Schema is available, so that other features such as MySQL Enterprise Firewall and query rewrite plugins have access to statement digests.

- [Statement Digest General Concepts](#)
- [Statement Digests in the Performance Schema](#)
- [Statement Digest Memory Use](#)
- [Statement Sampling](#)

### Statement Digest General Concepts

When the parser receives an SQL statement, it computes a statement digest if that digest is needed, which is true if any of the following conditions are true:

- Performance Schema digest instrumentation is enabled
- MySQL Enterprise Firewall is enabled
- A query rewrite plugin is enabled

The parser is also used by the `STATEMENT_DIGEST_TEXT()` and `STATEMENT_DIGEST()` functions, which applications can call to compute a normalized statement digest and a digest hash value, respectively, from an SQL statement.

The `max_digest_length` system variable value determines the maximum number of bytes available per session for computation of normalized statement digests. Once that amount of space is used during digest computation, truncation occurs: no further tokens from a parsed statement are collected or figure into its digest value. Statements that differ only after that many bytes of parsed tokens produce the same normalized statement digest and are considered identical if compared or if aggregated for digest statistics.

#### Warning

Setting the `max_digest_length` system variable to zero disables digest production, which also disables server functionality that requires digests.

After the normalized statement has been computed, a SHA-256 hash value is computed from it. In addition:

- If MySQL Enterprise Firewall is enabled, it is called and the digest as computed is available to it.
- If any query rewrite plugin is enabled, it is called and the statement digest and digest value are available to it.

- If the Performance Schema has digest instrumentation enabled, it makes a copy of the normalized statement digest, allocating a maximum of `performance_schema_max_digest_length` bytes for it. Consequently, if `performance_schema_max_digest_length` is less than `max_digest_length`, the copy is truncated relative to the original. The copy of the normalized statement digest is stored in the appropriate Performance Schema tables, along with the SHA-256 hash value computed from the original normalized statement. (If the Performance Schema truncates its copy of the normalized statement digest relative to the original, it does not recompute the SHA-256 hash value.)

Statement normalization transforms the statement text to a more standardized digest string representation that preserves the general statement structure while removing information not essential to the structure:

- Object identifiers such as database and table names are preserved.
- Literal values are converted to parameter markers. A normalized statement does not retain information such as names, passwords, dates, and so forth.
- Comments are removed and whitespace is adjusted.

Consider these statements:

```
SELECT * FROM orders WHERE customer_id=10 AND quantity>20
SELECT * FROM orders WHERE customer_id = 20 AND quantity > 100
```

To normalize these statements, the parser replaces data values by `?` and adjusts whitespace. Both statements yield the same normalized form and thus are considered “the same”:

```
SELECT * FROM orders WHERE customer_id = ? AND quantity > ?
```

The normalized statement contains less information but is still representative of the original statement. Other similar statements that have different data values have the same normalized form.

Now consider these statements:

```
SELECT * FROM customers WHERE customer_id = 1000
SELECT * FROM orders WHERE customer_id = 1000
```

In this case, the normalized statements differ because the object identifiers differ:

```
SELECT * FROM customers WHERE customer_id = ?
SELECT * FROM orders WHERE customer_id = ?
```

If normalization produces a statement that exceeds the space available in the digest buffer (as determined by `max_digest_length`), truncation occurs and the text ends with “...”. Long normalized statements that differ only in the part that occurs following the “...” are considered the same. Consider these statements:

```
SELECT * FROM mytable WHERE cola = 10 AND colb = 20
SELECT * FROM mytable WHERE cola = 10 AND colc = 20
```

If the cutoff happens to be right after the `AND`, both statements have this normalized form:

```
SELECT * FROM mytable WHERE cola = ? AND ...
```

In this case, the difference in the second column name is lost and both statements are considered the same.

## Statement Digests in the Performance Schema

In the Performance Schema, statement digesting involves these elements:

- A `statements_digest` consumer in the `setup_consumers` table controls whether the Performance Schema maintains digest information. See [Statement Digest Consumer](#).

- The statement event tables (`events_statements_current`, `events_statements_history`, and `events_statements_history_long`) have columns for storing normalized statement digests and the corresponding digest SHA-256 hash values:
  - `DIGEST_TEXT` is the text of the normalized statement digest. This is a copy of the original normalized statement that was computed to a maximum of `max_digest_length` bytes, further truncated as necessary to `performance_schema_max_digest_length` bytes.
  - `DIGEST` is the digest SHA-256 hash value computed from the original normalized statement.

See [Section 29.12.6, “Performance Schema Statement Event Tables”](#).

- The `events_statements_summary_by_digest` summary table provides aggregated statement digest information. This table aggregates information for statements per `SCHEMA_NAME` and `DIGEST` combination. The Performance Schema uses SHA-256 hash values for aggregation because they are fast to compute and have a favorable statistical distribution that minimizes collisions. See [Section 29.12.20.3, “Statement Summary Tables”](#).

Some Performance Tables have a column that stores original SQL statements from which digests are computed:

- The `SQL_TEXT` column of the `events_statements_current`, `events_statements_history`, and `events_statements_history_long` statement event tables.
- The `QUERY_SAMPLE_TEXT` column of the `events_statements_summary_by_digest` summary table.

The maximum space available for statement display is 1024 bytes by default. To change this value, set the `performance_schema_max_sql_text_length` system variable at server startup. Changes affect the storage required for all the columns just named.

The `performance_schema_max_digest_length` system variable determines the maximum number of bytes available per statement for digest value storage in the Performance Schema. However, the display length of statement digests may be longer than the available buffer size due to internal encoding of statement elements such as keywords and literal values. Consequently, values selected from the `DIGEST_TEXT` column of statement event tables may appear to exceed the `performance_schema_max_digest_length` value.

The `events_statements_summary_by_digest` summary table provides a profile of the statements executed by the server. It shows what kinds of statements an application is executing and how often. An application developer can use this information together with other information in the table to assess the application's performance characteristics. For example, table columns that show wait times, lock times, or index use may highlight types of queries that are inefficient. This gives the developer insight into which parts of the application need attention.

The `events_statements_summary_by_digest` summary table has a fixed size. By default the Performance Schema estimates the size to use at startup. To specify the table size explicitly, set the `performance_schema_digests_size` system variable at server startup. If the table becomes full, the Performance Schema groups statements that have `SCHEMA_NAME` and `DIGEST` values not matching existing values in the table in a special row with `SCHEMA_NAME` and `DIGEST` set to `NULL`. This permits all statements to be counted. However, if the special row accounts for a significant percentage of the statements executed, it might be desirable to increase the summary table size by increasing `performance_schema_digests_size`.

## Statement Digest Memory Use

For applications that generate very long statements that differ only at the end, increasing `max_digest_length` enables computation of digests that distinguish statements that would otherwise aggregate to the same digest. Conversely, decreasing `max_digest_length` causes the server to devote less memory to digest storage but increases the likelihood of longer statements aggregating to the same digest. Administrators should keep in mind that larger values result in

correspondingly increased memory requirements, particularly for workloads that involve large numbers of simultaneous sessions (the server allocates `max_digest_length` bytes per session).

As described previously, normalized statement digests as computed by the parser are constrained to a maximum of `max_digest_length` bytes, whereas normalized statement digests stored in the Performance Schema use `performance_schema_max_digest_length` bytes. The following memory-use considerations apply regarding the relative values of `max_digest_length` and `performance_schema_max_digest_length`:

- If `max_digest_length` is less than `performance_schema_max_digest_length`:
  - Server features other than the Performance Schema use normalized statement digests that take up to `max_digest_length` bytes.
  - The Performance Schema does not further truncate normalized statement digests that it stores, but allocates more memory than `max_digest_length` bytes per digest, which is unnecessary.
- If `max_digest_length` equals `performance_schema_max_digest_length`:
  - Server features other than the Performance Schema use normalized statement digests that take up to `max_digest_length` bytes.
  - The Performance Schema does not further truncate normalized statement digests that it stores, and allocates the same amount of memory as `max_digest_length` bytes per digest.
- If `max_digest_length` is greater than `performance_schema_max_digest_length`:
  - Server features other than the Performance Schema use normalized statement digests that take up to `max_digest_length` bytes.
  - The Performance Schema further truncates normalized statement digests that it stores, and allocates less memory than `max_digest_length` bytes per digest.

Because the Performance Schema statement event tables might store many digests, setting `performance_schema_max_digest_length` smaller than `max_digest_length` enables administrators to balance these factors:

- The need to have long normalized statement digests available to server features outside the Performance Schema
- Many concurrent sessions, each of which allocates digest-computation memory
- The need to limit memory consumption by the Performance Schema statement event tables when storing many statement digests

The `performance_schema_max_digest_length` setting is not per session, it is per statement, and a session can store multiple statements in the `events_statements_history` table. A typical number of statements in this table is 10 per session, so each session consumes 10 times the memory indicated by the `performance_schema_max_digest_length` value, for this table alone.

Also, there are many statements (and digests) collected globally, most notably in the `events_statements_history_long` table. Here, too,  $N$  statements stored consumes  $N$  times the memory indicated by the `performance_schema_max_digest_length` value.

To assess the amount of memory used for SQL statement storage and digest computation, use the `SHOW ENGINE PERFORMANCE_SCHEMA STATUS` statement, or monitor these instruments:

```
mysql> SELECT NAME
 FROM performance_schema.setup_instruments
 WHERE NAME LIKE '%.sqltext';
+-----+-----+
| NAME | |
+-----+-----+
| memory/performance_schema/events_statements_history.sqltext |
```

```
| memory/performance_schema/events_statements_current.sqltext |
| memory/performance_schema/events_statements_history_long.sqltext |
+-----+-----+
mysql> SELECT NAME
 FROM performance_schema.setup_instruments
 WHERE NAME LIKE 'memory/performance_schema%.*tokens';
+-----+-----+
| NAME
+-----+
| memory/performance_schema/events_statements_history.tokens
| memory/performance_schema/events_statements_current.tokens
| memory/performance_schema/events_statements_summary_by_digest.tokens
| memory/performance_schema/events_statements_history_long.tokens
+-----+
```

## Statement Sampling

The Performance Schema uses statement sampling to collect representative statements that produce each digest value in the `events_statements_summary_by_digest` table. These columns store sample statement information: `QUERY_SAMPLE_TEXT` (the text of the statement), `QUERY_SAMPLE_SEEN` (when the statement was seen), and `QUERY_SAMPLE_TIMER_WAIT` (the statement wait or execution time). The Performance Schema updates all three columns each time it chooses a sample statement.

When a new table row is inserted, the statement that produced the row digest value is stored as the current sample statement associated with the digest. Thereafter, when the server sees other statements with the same digest value, it determines whether to use the new statement to replace the current sample statement (that is, whether to resample). Resampling policy is based on the comparative wait times of the current sample statement and new statement and, optionally, the age of the current sample statement:

- Resampling based on wait times: If the new statement wait time has a wait time greater than that of the current sample statement, it becomes the current sample statement.
- Resampling based on age: If the `performance_schema_max_digest_sample_age` system variable has a value greater than zero and the current sample statement is more than that many seconds old, the current statement is considered “too old” and the new statement replaces it. This occurs even if the new statement wait time is less than that of the current sample statement.

By default, `performance_schema_max_digest_sample_age` is 60 seconds (1 minute). To change how quickly sample statements “expire” due to age, increase or decrease the value. To disable the age-based part of the resampling policy, set `performance_schema_max_digest_sample_age` to 0.

## 29.11 Performance Schema General Table Characteristics

The name of the `performance_schema` database is lowercase, as are the names of tables within it. Queries should specify the names in lowercase.

Many tables in the `performance_schema` database are read only and cannot be modified:

```
mysql> TRUNCATE TABLE performance_schema.setup_instruments;
ERROR 1683 (HY000): Invalid performance_schema usage.
```

Some of the setup tables have columns that can be modified to affect Performance Schema operation; some also permit rows to be inserted or deleted. Truncation is permitted to clear collected events, so `TRUNCATE TABLE` can be used on tables containing those kinds of information, such as tables named with a prefix of `events_waits_`.

Summary tables can be truncated with `TRUNCATE TABLE`. Generally, the effect is to reset the summary columns to 0 or `NULL`, not to remove rows. This enables you to clear collected values and restart aggregation. That might be useful, for example, after you have made a runtime configuration change. Exceptions to this truncation behavior are noted in individual summary table sections.

Privileges are as for other databases and tables:

- To retrieve from `performance_schema` tables, you must have the `SELECT` privilege.
- To change those columns that can be modified, you must have the `UPDATE` privilege.
- To truncate tables that can be truncated, you must have the `DROP` privilege.

Because only a limited set of privileges apply to Performance Schema tables, attempts to use `GRANT ALL` as shorthand for granting privileges at the database or table level fail with an error:

```
mysql> GRANT ALL ON performance_schema.*
 TO 'u1'@'localhost';
ERROR 1044 (42000): Access denied for user 'root'@'localhost'
to database 'performance_schema'
mysql> GRANT ALL ON performance_schema.setup_instruments
 TO 'u2'@'localhost';
ERROR 1044 (42000): Access denied for user 'root'@'localhost'
to database 'performance_schema'
```

Instead, grant exactly the desired privileges:

```
mysql> GRANT SELECT ON performance_schema.*
 TO 'u1'@'localhost';
Query OK, 0 rows affected (0.03 sec)

mysql> GRANT SELECT, UPDATE ON performance_schema.setup_instruments
 TO 'u2'@'localhost';
Query OK, 0 rows affected (0.02 sec)
```

## 29.12 Performance Schema Table Descriptions

Tables in the `performance_schema` database can be grouped as follows:

- Setup tables. These tables are used to configure and display monitoring characteristics.
- Current events tables. The `events_waits_current` table contains the most recent event for each thread. Other similar tables contain current events at different levels of the event hierarchy: `events_stages_current` for stage events, `events_statements_current` for statement events, and `events_transactions_current` for transaction events.
- History tables. These tables have the same structure as the current events tables, but contain more rows. For example, for wait events, `events_waits_history` table contains the most recent 10 events per thread. `events_waits_history_long` contains the most recent 10,000 events. Other similar tables exist for stage, statement, and transaction histories.

To change the sizes of the history tables, set the appropriate system variables at server startup. For example, to set the sizes of the wait event history tables, set `performance_schema_events_waits_history_size` and `performance_schema_events_waits_history_long_size`.

- Summary tables. These tables contain information aggregated over groups of events, including those that have been discarded from the history tables.
- Instance tables. These tables document what types of objects are instrumented. An instrumented object, when used by the server, produces an event. These tables provide event names and explanatory notes or status information.
- Miscellaneous tables. These do not fall into any of the other table groups.

### 29.12.1 Performance Schema Table Reference

The following table summarizes all available Performance Schema tables. For greater detail, see the individual table descriptions.

**Table 29.1 Performance Schema Tables**

<b>Table Name</b>	<b>Description</b>
<code>accounts</code>	Connection statistics per client account
<code>binary_log_transaction_compression_status</code>	Binary log transaction compression
<code>clone_progress</code>	Clone operation progress
<code>clone_status</code>	Clone operation status
<code>component_scheduler_tasks</code>	Status of scheduled tasks
<code>cond_instances</code>	Synchronization object instances
<code>data_lock_waits</code>	Data lock wait relationships
<code>data_locks</code>	Data locks held and requested
<code>error_log</code>	Server error log recent entries
<code>events_errors_summary_by_account_by_error</code>	Errors per account and error code
<code>events_errors_summary_by_host_by_error</code>	Errors per host and error code
<code>events_errors_summary_by_thread_by_error</code>	Errors per thread and error code
<code>events_errors_summary_by_user_by_error</code>	Errors per user and error code
<code>events_errors_summary_global_by_error</code>	Errors per error code
<code>events_stages_current</code>	Current stage events
<code>events_stages_history</code>	Most recent stage events per thread
<code>events_stages_history_long</code>	Most recent stage events overall
<code>events_stages_summary_by_account_by_event_name</code>	Stage events per account and event name
<code>events_stages_summary_by_host_by_event_name</code>	Stage events per host name and event name
<code>events_stages_summary_by_thread_by_event_name</code>	Stage waits per thread and event name
<code>events_stages_summary_by_user_by_event_name</code>	Stage events per user name and event name
<code>events_stages_summary_global_by_event_name</code>	Stage waits per event name
<code>events_statements_current</code>	Current statement events
<code>events_statements_histogram_by_digest</code>	Statement histograms per schema and digest value
<code>events_statements_histogram_global</code>	Statement histogram summarized globally
<code>events_statements_history</code>	Most recent statement events per thread
<code>events_statements_history_long</code>	Most recent statement events overall
<code>events_statements_summary_by_account_by_event_name</code>	Statement events per account and event name
<code>events_statements_summary_by_digest</code>	Statement events per schema and digest value
<code>events_statements_summary_by_host_by_event_name</code>	Statement events per host name and event name
<code>events_statements_summary_by_program</code>	Statement events per stored program
<code>events_statements_summary_by_thread_by_event_name</code>	Statement events per thread and event name
<code>events_statements_summary_by_user_by_event_name</code>	Statement events per user name and event name
<code>events_statements_summary_global_by_event_name</code>	Statement events per event name
<code>events_transactions_current</code>	Current transaction events
<code>events_transactions_history</code>	Most recent transaction events per thread
<code>events_transactions_history_long</code>	Most recent transaction events overall
<code>events_transactions_summary_by_account</code>	Transaction events per account and event name

Table Name	Description
events_transactions_summary_by_host_by_event_name	Transaction events per host name and event name
events_transactions_summary_by_thread_by_event_name	Transaction events per thread and event name
events_transactions_summary_by_user_by_event_name	Transaction events per user name and event name
events_transactions_summary_global_by_event_name	Transaction events per event name
events_waits_current	Current wait events
events_waits_history	Most recent wait events per thread
events_waits_history_long	Most recent wait events overall
events_waits_summary_by_account_by_event_name	Wait events per account and event name
events_waits_summary_by_host_by_event_name	Wait events per host name and event name
events_waits_summary_by_instance	Wait events per instance
events_waits_summary_by_thread_by_event_name	Wait events per thread and event name
events_waits_summary_by_user_by_event_name	Wait events per user name and event name
events_waits_summary_global_by_event_name	Wait events per event name
file_instances	File instances
file_summary_by_event_name	File events per event name
file_summary_by_instance	File events per file instance
firewall_group_allowlist	Firewall in-memory data for group profile allowlists
firewall_groups	Firewall in-memory data for group profiles
firewall_membership	Firewall in-memory data for group profile members
global_status	Global status variables
global_variables	Global system variables
host_cache	Information from internal host cache
hosts	Connection statistics per client host name
keyring_component_status	Status information for installed keyring component
keyring_keys	Metadata for keyring keys
log_status	Information about server logs for backup purposes
memory_summary_by_account_by_event_name	Memory operations per account and event name
memory_summary_by_host_by_event_name	Memory operations per host and event name
memory_summary_by_thread_by_event_name	Memory operations per thread and event name
memory_summary_by_user_by_event_name	Memory operations per user and event name
memory_summary_global_by_event_name	Memory operations globally per event name
metadata_locks	Metadata locks and lock requests
mutex_instances	Mutex synchronization object instances
ndb_sync_excluded_objects	NDB objects which cannot be synchronized
ndb_sync_pending_objects	NDB objects waiting for synchronization
objects_summary_global_by_type	Object summaries
performance_timers	Which event timers are available
persisted_variables	Contents of mysqld-auto.cnf file
prepared_statements_instances	Prepared statement instances and statistics

Table Name	Description
processlist	Process list information
replication_applier_configuration	Configuration parameters for replication applier on replica
replication_applier_filters	Channel-specific replication filters on current replica
replication_applier_global_filters	Global replication filters on current replica
replication_applier_status	Current status of replication applier on replica
replication_applier_status_by_coordinator	SQL or coordinator thread applier status
replication_applier_status_by_worker	Worker thread applier status
replication_asynchronous_connection_failover_managed_source_lists	Source lists for asynchronous connection failover mechanism
replication_asynchronous_connection_failover_managed_target_lists	Managed target lists for asynchronous connection failover mechanism
replication_connection_configuration	Configuration parameters for connecting to source
replication_connection_status	Current status of connection to source
replication_group_communication_information	Replication group configuration options
replication_group_member_stats	Replication group member statistics
replication_group_members	Replication group member network and status
rwlock_instances	Lock synchronization object instances
session_account_connect_attrs	Connection attributes per for current session
session_connect_attrs	Connection attributes for all sessions
session_status	Status variables for current session
session_variables	System variables for current session
setup_actors	How to initialize monitoring for new foreground threads
setup_consumers	Consumers for which event information can be stored
setup_instruments	Classes of instrumented objects for which events can be collected
setup_objects	Which objects should be monitored
setup_threads	Instrumented thread names and attributes
socket_instances	Active connection instances
socket_summary_by_event_name	Socket waits and I/O per event name
socket_summary_by_instance	Socket waits and I/O per instance
status_by_account	Session status variables per account
status_by_host	Session status variables per host name
status_by_thread	Session status variables per session
status_by_user	Session status variables per user name
table_handles	Table locks and lock requests
table_io_waits_summary_by_index_usage	Table I/O waits per index
table_io_waits_summary_by_table	Table I/O waits per table
table_lock_waits_summary_by_table	Table lock waits per table
threads	Information about server threads

Table Name	Description
<code>tls_channel_status</code>	TLS status for each connection interface
<code>tp_thread_group_state</code>	Thread pool thread group states
<code>tp_thread_group_stats</code>	Thread pool thread group statistics
<code>tp_thread_state</code>	Thread pool thread information
<code>user_defined_functions</code>	Registered loadable functions
<code>user_variables_by_thread</code>	User-defined variables per thread
<code>users</code>	Connection statistics per client user name
<code>variables_by_thread</code>	Session system variables per session
<code>variables_info</code>	How system variables were most recently set

## 29.12.2 Performance Schema Setup Tables

The setup tables provide information about the current instrumentation and enable the monitoring configuration to be changed. For this reason, some columns in these tables can be changed if you have the `UPDATE` privilege.

The use of tables rather than individual variables for setup information provides a high degree of flexibility in modifying Performance Schema configuration. For example, you can use a single statement with standard SQL syntax to make multiple simultaneous configuration changes.

These setup tables are available:

- `setup_actors`: How to initialize monitoring for new foreground threads
- `setup_consumers`: The destinations to which event information can be sent and stored
- `setup_instruments`: The classes of instrumented objects for which events can be collected
- `setup_objects`: Which objects should be monitored
- `setup_threads`: Instrumented thread names and attributes

### 29.12.2.1 The `setup_actors` Table

The `setup_actors` table contains information that determines whether to enable monitoring and historical event logging for new foreground server threads (threads associated with client connections). This table has a maximum size of 100 rows by default. To change the table size, modify the `performance_schema_setup_actors_size` system variable at server startup.

For each new foreground thread, the Performance Schema matches the user and host for the thread against the rows of the `setup_actors` table. If a row from that table matches, its `ENABLED` and `HISTORY` column values are used to set the `INSTRUMENTED` and `HISTORY` columns, respectively, of the `threads` table row for the thread. This enables instrumenting and historical event logging to be applied selectively per host, user, or account (user and host combination). If there is no match, the `INSTRUMENTED` and `HISTORY` columns for the thread are set to `NO`.

For background threads, there is no associated user. `INSTRUMENTED` and `HISTORY` are `YES` by default and `setup_actors` is not consulted.

The initial contents of the `setup_actors` table match any user and host combination, so monitoring and historical event collection are enabled by default for all foreground threads:

```
mysql> SELECT * FROM performance_schema.setup_actors;
+-----+-----+-----+-----+
| HOST | USER | ROLE | ENABLED | HISTORY |
+-----+-----+-----+-----+
| % | % | % | YES | YES |
+-----+-----+-----+-----+
```

For information about how to use the `setup_actors` table to affect event monitoring, see [Section 29.4.6, “Pre-Filtering by Thread”](#).

Modifications to the `setup_actors` table affect only foreground threads created subsequent to the modification, not existing threads. To affect existing threads, modify the `INSTRUMENTED` and `HISTORY` columns of `threads` table rows.

The `setup_actors` table has these columns:

- `HOST`

The host name. This should be a literal name, or '`%`' to mean "any host."

- `USER`

The user name. This should be a literal name, or '`%`' to mean "any user."

- `ROLE`

Unused.

- `ENABLED`

Whether to enable instrumentation for foreground threads matched by the row. The value is `YES` or `NO`.

- `HISTORY`

Whether to log historical events for foreground threads matched by the row. The value is `YES` or `NO`.

The `setup_actors` table has these indexes:

- Primary key on (`HOST`, `USER`, `ROLE`)

`TRUNCATE TABLE` is permitted for the `setup_actors` table. It removes the rows.

### 29.12.2.2 The `setup_consumers` Table

The `setup_consumers` table lists the types of consumers for which event information can be stored and which are enabled:

mysql> SELECT * FROM performance_schema.setup_consumers;	
NAME	ENABLED
events_stages_current	NO
events_stages_history	NO
events_stages_history_long	NO
events_statements_current	YES
events_statements_history	YES
events_statements_history_long	NO
events_transactions_current	YES
events_transactions_history	YES
events_transactions_history_long	NO
events_waits_current	NO
events_waits_history	NO
events_waits_history_long	NO
global_instrumentation	YES
thread_instrumentation	YES
statements_digest	YES

The consumer settings in the `setup_consumers` table form a hierarchy from higher levels to lower. For detailed information about the effect of enabling different consumers, see [Section 29.4.7, “Pre-Filtering by Consumer”](#).

Modifications to the `setup_consumers` table affect monitoring immediately.

The `setup_consumers` table has these columns:

- `NAME`

The consumer name.

- `ENABLED`

Whether the consumer is enabled. The value is `YES` or `NO`. This column can be modified. If you disable a consumer, the server does not spend time adding event information to it.

The `setup_consumers` table has these indexes:

- Primary key on (`NAME`)

`TRUNCATE TABLE` is not permitted for the `setup_consumers` table.

### 29.12.2.3 The `setup_instruments` Table

The `setup_instruments` table lists classes of instrumented objects for which events can be collected:

```
mysql> SELECT * FROM performance_schema.setup_instruments\G
***** 1. row *****
 NAME: wait/synch/mutex/pfs/LOCK_pfs_share_list
 ENABLED: NO
 TIMED: NO
 PROPERTIES: singleton
 FLAGS: NULL
VOLATILITY: 1
DOCUMENTATION: Components can provide their own performance_schema tables.
This lock protects the list of such tables definitions.
...
***** 410. row *****
 NAME: stage/sql/executing
 ENABLED: NO
 TIMED: NO
 PROPERTIES:
 FLAGS: NULL
VOLATILITY: 0
DOCUMENTATION: NULL
...
***** 733. row *****
 NAME: statement/abstract/Query
 ENABLED: YES
 TIMED: YES
 PROPERTIES: mutable
 FLAGS: NULL
VOLATILITY: 0
DOCUMENTATION: SQL query just received from the network.
At this point, the real statement type is unknown, the type
will be refined after SQL parsing.
...
***** 737. row *****
 NAME: memory/performance_schema/mutex_instances
 ENABLED: YES
 TIMED: NULL
 PROPERTIES: global_statistics
 FLAGS:
VOLATILITY: 1
DOCUMENTATION: Memory used for table performance_schema.mutex_instances
...
***** 823. row *****
 NAME: memory/sql/Prepared_statement::infrastructure
 ENABLED: YES
 TIMED: NULL
 PROPERTIES: controlled_by_default
 FLAGS: controlled
VOLATILITY: 0
DOCUMENTATION: Map infrastructure for prepared statements per session.
```

...

Each instrument added to the source code provides a row for the `setup_instruments` table, even when the instrumented code is not executed. When an instrument is enabled and executed, instrumented instances are created, which are visible in the `xxx_instances` tables, such as `file_instances` or `rwlock_instances`.

Modifications to most `setup_instruments` rows affect monitoring immediately. For some instruments, modifications are effective only at server startup; changing them at runtime has no effect. This affects primarily mutexes, conditions, and rwlocks in the server, although there may be other instruments for which this is true.

For more information about the role of the `setup_instruments` table in event filtering, see [Section 29.4.3, “Event Pre-Filtering”](#).

The `setup_instruments` table has these columns:

- `NAME`

The instrument name. Instrument names may have multiple parts and form a hierarchy, as discussed in [Section 29.6, “Performance Schema Instrument Naming Conventions”](#). Events produced from execution of an instrument have an `EVENT_NAME` value that is taken from the instrument `NAME` value. (Events do not really have a “name,” but this provides a way to associate events with instruments.)

- `ENABLED`

Whether the instrument is enabled. The value is `YES` or `NO`. A disabled instrument produces no events. This column can be modified, although setting `ENABLED` has no effect for instruments that have already been created.

- `TIMED`

Whether the instrument is timed. The value is `YES`, `NO`, or `NULL`. This column can be modified, although setting `TIMED` has no effect for instruments that have already been created.

A `TIMED` value of `NULL` indicates that the instrument does not support timing. For example, memory operations are not timed, so their `TIMED` column is `NULL`.

Setting `TIMED` to `NULL` for an instrument that supports timing has no effect, as does setting `TIMED` to non-`NULL` for an instrument that does not support timing.

If an enabled instrument is not timed, the instrument code is enabled, but the timer is not. Events produced by the instrument have `NULL` for the `TIMER_START`, `TIMER_END`, and `TIMER_WAIT` timer values. This in turn causes those values to be ignored when calculating the sum, minimum, maximum, and average time values in summary tables.

- `PROPERTIES`

The instrument properties. This column uses the `SET` data type, so multiple flags from the following list can be set per instrument:

- `controlled_by_default`: memory is collected by default for this instrument.
- `global_statistics`: The instrument produces only global summaries. Summaries for finer levels are unavailable, such as per thread, account, user, or host. For example, most memory instruments produce only global summaries.
- `mutable`: The instrument can “mutate” into a more specific one. This property applies only to statement instruments.
- `progress`: The instrument is capable of reporting progress data. This property applies only to stage instruments.

- **singleton**: The instrument has a single instance. For example, most global mutex locks in the server are singletons, so the corresponding instruments are as well.
- **user**: The instrument is directly related to user workload (as opposed to system workload). One such instrument is [wait/io/socket/sql/client\\_connection](#).
- **FLAGS**

Whether the instrument's memory is controlled.

This flag is supported for non-global memory instruments, only, and can be set or unset. For example:

```
SQL> UPDATE PERFORMANCE_SCHEMA.SETUP_INTRUMENTS SET FLAGS="controlled" WHERE NAME='memory/s...
```

#### Note

Attempting to set `FLAGS = controlled` on non-memory instruments, or on global memory instruments, fails silently.

- **VOLATILITY**

The instrument volatility. Volatility values range from low to high. The values correspond to the `PSI_VOLATILITY_xxx` constants defined in the [mysql/psi/psi\\_base.h](#) header file:

```
#define PSI_VOLATILITY_UNKNOWN 0
#define PSI_VOLATILITY_PERMANENT 1
#define PSI_VOLATILITY_PROVISIONING 2
#define PSI_VOLATILITY_DDL 3
#define PSI_VOLATILITY_CACHE 4
#define PSI_VOLATILITY_SESSION 5
#define PSI_VOLATILITY_TRANSACTION 6
#define PSI_VOLATILITY_QUERY 7
#define PSI_VOLATILITY_INTRA_QUERY 8
```

The `VOLATILITY` column is purely informational, to provide users (and the Performance Schema code) some hint about the instrument runtime behavior.

Instruments with a low volatility index (`PERMANENT = 1`) are created once at server startup, and never destroyed or re-created during normal server operation. They are destroyed only during server shutdown.

For example, the `wait/synch/mutex/pfs/LOCK_pfs_share_list` mutex is defined with a volatility of 1, which means it is created once. Possible overhead from the instrumentation itself (namely, mutex initialization) has no effect for this instrument then. Runtime overhead occurs only when locking or unlocking the mutex.

Instruments with a higher volatility index (for example, `SESSION = 5`) are created and destroyed for every user session. For example, the `wait/synch/mutex/sql/THD::LOCK_query_plan` mutex is created each time a session connects, and destroyed when the session disconnects.

This mutex is more sensitive to Performance Schema overhead, because overhead comes not only from the lock and unlock instrumentation, but also from mutex create and destroy instrumentation, which is executed more often.

Another aspect of volatility concerns whether and when an update to the `ENABLED` column actually has some effect:

- An update to `ENABLED` affects instrumented objects created subsequently, but has no effect on instruments already created.

- Instruments that are more “volatile” use new settings from the `setup_instruments` table sooner.

For example, this statement does not affect the `LOCK_query_plan` mutex for existing sessions, but does have an effect on new sessions created subsequent to the update:

```
UPDATE performance_schema.setup_instruments
SET ENABLED=value
WHERE NAME = 'wait/synch/mutex/sql/THD::LOCK_query_plan';
```

This statement actually has no effect at all:

```
UPDATE performance_schema.setup_instruments
SET ENABLED=value
WHERE NAME = 'wait/synch/mutex/pfs/LOCK_pfs_share_list';
```

This mutex is permanent, and was created already before the update is executed. The mutex is never created again, so the `ENABLED` value in `setup_instruments` is never used. To enable or disable this mutex, use the `mutex_instances` table instead.

- [DOCUMENTATION](#)

A string describing the instrument purpose. The value is `NULL` if no description is available.

The `setup_instruments` table has these indexes:

- Primary key on (`NAME`)

`TRUNCATE TABLE` is not permitted for the `setup_instruments` table.

To assist monitoring and troubleshooting, the Performance Schema instrumentation is used to export names of instrumented threads to the operating system. This enables utilities that display thread names, such as debuggers and the Unix `ps` command, to display distinct `mysqld` thread names rather than “`mysqld`”. This feature is supported only on Linux, macOS, and Windows.

Suppose that `mysqld` is running on a system that has a version of `ps` that supports this invocation syntax:

```
ps -C mysqld H -o "pid tid cmd comm"
```

Without export of thread names to the operating system, the command displays output like this, where most `COMMAND` values are `mysqld`:

PID	TID	CMD	COMMAND
1377	1377	/usr/sbin/mysqld	mysqld
1377	1528	/usr/sbin/mysqld	mysqld
1377	1529	/usr/sbin/mysqld	mysqld
1377	1530	/usr/sbin/mysqld	mysqld
1377	1531	/usr/sbin/mysqld	mysqld
1377	1534	/usr/sbin/mysqld	mysqld
1377	1535	/usr/sbin/mysqld	mysqld
1377	1588	/usr/sbin/mysqld	xpl_worker1
1377	1589	/usr/sbin/mysqld	xpl_worker0
1377	1590	/usr/sbin/mysqld	mysqld
1377	1594	/usr/sbin/mysqld	mysqld
1377	1595	/usr/sbin/mysqld	mysqld

With export of thread names to the operating system, the output looks like this, with threads having a name similar to their instrument name:

PID	TID	CMD	COMMAND
27668	27668	/usr/sbin/mysqld	mysqld
27668	27671	/usr/sbin/mysqld	ib_io_ibuf
27668	27672	/usr/sbin/mysqld	ib_io_log
27668	27673	/usr/sbin/mysqld	ib_io_rd-1
27668	27674	/usr/sbin/mysqld	ib_io_rd-2
27668	27677	/usr/sbin/mysqld	ib_io_wr-1

27668	27678	/usr/sbin/mysqld	ib_io_wr-2
27668	27699	/usr/sbin/mysqld	xpl_worker-2
27668	27700	/usr/sbin/mysqld	xpl_accept-1
27668	27710	/usr/sbin/mysqld	evt_sched
27668	27711	/usr/sbin/mysqld	sig_handler
27668	27933	/usr/sbin/mysqld	connection

Different thread instances within the same class are numbered to provide distinct names where that is feasible. Due to constraints on name lengths with respect to potentially large numbers of connections, connections are named simply `connection`.

#### 29.12.2.4 The `setup_objects` Table

The `setup_objects` table controls whether the Performance Schema monitors particular objects. This table has a maximum size of 100 rows by default. To change the table size, modify the `performance_schema_setup_objects_size` system variable at server startup.

The initial `setup_objects` contents look like this:

```
mysql> SELECT * FROM performance_schema.setup_objects;
+-----+-----+-----+-----+-----+
| OBJECT_TYPE | OBJECT_SCHEMA | OBJECT_NAME | ENABLED | TIMED |
+-----+-----+-----+-----+-----+
| EVENT | mysql | % | NO | NO |
| EVENT | performance_schema | % | NO | NO |
| EVENT | information_schema | % | NO | NO |
| EVENT | % | % | YES | YES |
| FUNCTION | mysql | % | NO | NO |
| FUNCTION | performance_schema | % | NO | NO |
| FUNCTION | information_schema | % | NO | NO |
| FUNCTION | % | % | YES | YES |
| PROCEDURE | mysql | % | NO | NO |
| PROCEDURE | performance_schema | % | NO | NO |
| PROCEDURE | information_schema | % | NO | NO |
| PROCEDURE | % | % | YES | YES |
| TABLE | mysql | % | NO | NO |
| TABLE | performance_schema | % | NO | NO |
| TABLE | information_schema | % | NO | NO |
| TABLE | % | % | YES | YES |
| TRIGGER | mysql | % | NO | NO |
| TRIGGER | performance_schema | % | NO | NO |
| TRIGGER | information_schema | % | NO | NO |
| TRIGGER | % | % | YES | YES |
+-----+-----+-----+-----+-----+
```

Modifications to the `setup_objects` table affect object monitoring immediately.

For object types listed in `setup_objects`, the Performance Schema uses the table to how to monitor them. Object matching is based on the `OBJECT_SCHEMA` and `OBJECT_NAME` columns. Objects for which there is no match are not monitored.

The effect of the default object configuration is to instrument all tables except those in the `mysql`, `INFORMATION_SCHEMA`, and `performance_schema` databases. (Tables in the `INFORMATION_SCHEMA` database are not instrumented regardless of the contents of `setup_objects`; the row for `information_schema.%` simply makes this default explicit.)

When the Performance Schema checks for a match in `setup_objects`, it tries to find more specific matches first. For example, with a table `db1.t1`, it looks for a match for '`db1`' and '`t1`', then for '`db1`' and '`%`', then for '`%`' and '`%`'. The order in which matching occurs matters because different matching `setup_objects` rows can have different `ENABLED` and `TIMED` values.

Rows can be inserted into or deleted from `setup_objects` by users with the `INSERT` or `DELETE` privilege on the table. For existing rows, only the `ENABLED` and `TIMED` columns can be modified, by users with the `UPDATE` privilege on the table.

For more information about the role of the `setup_objects` table in event filtering, see [Section 29.4.3, “Event Pre-Filtering”](#).

The `setup_objects` table has these columns:

- `OBJECT_TYPE`

The type of object to instrument. The value is one of '`EVENT`' (Event Scheduler event), '`FUNCTION`' (stored function), '`PROCEDURE`' (stored procedure), '`TABLE`' (base table), or '`TRIGGER`' (trigger).

`TABLE` filtering affects table I/O events (`wait/io/table/sql/handler` instrument) and table lock events (`wait/lock/table/sql/handler` instrument).

- `OBJECT_SCHEMA`

The schema that contains the object. This should be a literal name, or '`%`' to mean "any schema."

- `OBJECT_NAME`

The name of the instrumented object. This should be a literal name, or '`%`' to mean "any object."

- `ENABLED`

Whether events for the object are instrumented. The value is `YES` or `NO`. This column can be modified.

- `TIMED`

Whether events for the object are timed. This column can be modified.

The `setup_objects` table has these indexes:

- Index on (`OBJECT_TYPE`, `OBJECT_SCHEMA`, `OBJECT_NAME`)

`TRUNCATE TABLE` is permitted for the `setup_objects` table. It removes the rows.

### 29.12.2.5 The `setup_threads` Table

The `setup_threads` table lists instrumented thread classes. It exposes thread class names and attributes:

```
mysql> SELECT * FROM performance_schema.setup_threads\G
***** 1. row *****
 NAME: thread/performance_schema/setup
 ENABLED: YES
 HISTORY: YES
 PROPERTIES: singleton
 VOLATILITY: 0
DOCUMENTATION: NULL
...
***** 4. row *****
 NAME: thread/sql/main
 ENABLED: YES
 HISTORY: YES
 PROPERTIES: singleton
 VOLATILITY: 0
DOCUMENTATION: NULL
...
***** 5. row *****
 NAME: thread/sql/one_connection
 ENABLED: YES
 HISTORY: YES
 PROPERTIES: user
 VOLATILITY: 0
DOCUMENTATION: NULL
...
***** 10. row *****
 NAME: thread/sql/event_scheduler
 ENABLED: YES
 HISTORY: YES
```

```
PROPERTIES: singleton
VOLATILITY: 0
DOCUMENTATION: NULL
```

The `setup_threads` table has these columns:

- **NAME**

The instrument name. Thread instruments begin with `thread` (for example, `thread/sql/parser_service` or `thread/performance_schema/setup`).

- **ENABLED**

Whether the instrument is enabled. The value is `YES` or `NO`. This column can be modified, although setting `ENABLED` has no effect for threads that are already running.

For background threads, setting the `ENABLED` value controls whether `INSTRUMENTED` is set to `YES` or `NO` for threads that are subsequently created for this instrument and listed in the `threads` table. For foreground threads, this column has no effect; the `setup_actors` table takes precedence.

- **HISTORY**

Whether to log historical events for the instrument. The value is `YES` or `NO`. This column can be modified, although setting `HISTORY` has no effect for threads that are already running.

For background threads, setting the `HISTORY` value controls whether `HISTORY` is set to `YES` or `NO` for threads that are subsequently created for this instrument and listed in the `threads` table. For foreground threads, this column has no effect; the `setup_actors` table takes precedence.

- **PROPERTIES**

The instrument properties. This column uses the `SET` data type, so multiple flags from the following list can be set per instrument:

- `singleton`: The instrument has a single instance. For example, there is only one thread for the `thread/sql/main` instrument.
- `user`: The instrument is directly related to user workload (as opposed to system workload). For example, threads such as `thread/sql/one_connection` executing a user session have the `user` property to differentiate them from system threads.
- **VOLATILITY**

The instrument volatility. This column has the same meaning as in the `setup_instruments` table. See [Section 29.12.2.3, “The setup\\_instruments Table”](#).

- **DOCUMENTATION**

A string describing the instrument purpose. The value is `NULL` if no description is available.

The `setup_threads` table has these indexes:

- Primary key on (`NAME`)

`TRUNCATE TABLE` is not permitted for the `setup_threads` table.

## 29.12.3 Performance Schema Instance Tables

Instance tables document what types of objects are instrumented. They provide event names and explanatory notes or status information:

- `cond_instances`: Condition synchronization object instances

- `file_instances`: File instances
- `mutex_instances`: Mutex synchronization object instances
- `rwlock_instances`: Lock synchronization object instances
- `socket_instances`: Active connection instances

These tables list instrumented synchronization objects, files, and connections. There are three types of synchronization objects: `cond`, `mutex`, and `rwlock`. Each instance table has an `EVENT_NAME` or `NAME` column to indicate the instrument associated with each row. Instrument names may have multiple parts and form a hierarchy, as discussed in [Section 29.6, “Performance Schema Instrument Naming Conventions”](#).

The `mutex_instances.LOCKED_BY_THREAD_ID` and `rwlock_instances.WRITE_LOCKED_BY_THREAD_ID` columns are extremely important for investigating performance bottlenecks or deadlocks. For examples of how to use them for this purpose, see [Section 29.19, “Using the Performance Schema to Diagnose Problems”](#)

#### 29.12.3.1 The `cond_instances` Table

The `cond_instances` table lists all the conditions seen by the Performance Schema while the server executes. A condition is a synchronization mechanism used in the code to signal that a specific event has happened, so that a thread waiting for this condition can resume work.

When a thread is waiting for something to happen, the condition name is an indication of what the thread is waiting for, but there is no immediate way to tell which other thread, or threads, causes the condition to happen.

The `cond_instances` table has these columns:

- `NAME`  
The instrument name associated with the condition.
- `OBJECT_INSTANCE_BEGIN`  
The address in memory of the instrumented condition.

The `cond_instances` table has these indexes:

- Primary key on (`OBJECT_INSTANCE_BEGIN`)
- Index on (`NAME`)

`TRUNCATE TABLE` is not permitted for the `cond_instances` table.

#### 29.12.3.2 The `file_instances` Table

The `file_instances` table lists all the files seen by the Performance Schema when executing file I/O instrumentation. If a file on disk has never been opened, it is not shown in `file_instances`. When a file is deleted from the disk, it is also removed from the `file_instances` table.

The `file_instances` table has these columns:

- `FILE_NAME`  
The file name.
- `EVENT_NAME`  
The instrument name associated with the file.
- `OPEN_COUNT`

The count of open handles on the file. If a file was opened and then closed, it was opened 1 time, but `OPEN_COUNT` is 0. To list all the files currently opened by the server, use `WHERE OPEN_COUNT > 0`.

The `file_instances` table has these indexes:

- Primary key on (`FILE_NAME`)
- Index on (`EVENT_NAME`)

`TRUNCATE TABLE` is not permitted for the `file_instances` table.

### 29.12.3.3 The mutex\_instances Table

The `mutex_instances` table lists all the mutexes seen by the Performance Schema while the server executes. A mutex is a synchronization mechanism used in the code to enforce that only one thread at a given time can have access to some common resource. The resource is said to be “protected” by the mutex.

When two threads executing in the server (for example, two user sessions executing a query simultaneously) do need to access the same resource (a file, a buffer, or some piece of data), these two threads compete against each other, so that the first query to obtain a lock on the mutex causes the other query to wait until the first is done and unlocks the mutex.

The work performed while holding a mutex is said to be in a “critical section,” and multiple queries do execute this critical section in a serialized way (one at a time), which is a potential bottleneck.

The `mutex_instances` table has these columns:

- `NAME`  
The instrument name associated with the mutex.
- `OBJECT_INSTANCE_BEGIN`  
The address in memory of the instrumented mutex.
- `LOCKED_BY_THREAD_ID`

When a thread currently has a mutex locked, `LOCKED_BY_THREAD_ID` is the `THREAD_ID` of the locking thread, otherwise it is `NULL`.

The `mutex_instances` table has these indexes:

- Primary key on (`OBJECT_INSTANCE_BEGIN`)
- Index on (`NAME`)
- Index on (`LOCKED_BY_THREAD_ID`)

`TRUNCATE TABLE` is not permitted for the `mutex_instances` table.

For every mutex instrumented in the code, the Performance Schema provides the following information.

- The `setup_instruments` table lists the name of the instrumentation point, with the prefix `wait/synch/mutex/`.
- When some code creates a mutex, a row is added to the `mutex_instances` table. The `OBJECT_INSTANCE_BEGIN` column is a property that uniquely identifies the mutex.
- When a thread attempts to lock a mutex, the `events_waits_current` table shows a row for that thread, indicating that it is waiting on a mutex (in the `EVENT_NAME` column), and indicating which mutex is waited on (in the `OBJECT_INSTANCE_BEGIN` column).

- When a thread succeeds in locking a mutex:
  - `events_waits_current` shows that the wait on the mutex is completed (in the `TIMER_END` and `TIMER_WAIT` columns)
  - The completed wait event is added to the `events_waits_history` and `events_waits_history_long` tables
  - `mutex_instances` shows that the mutex is now owned by the thread (in the `THREAD_ID` column).
- When a thread unlocks a mutex, `mutex_instances` shows that the mutex now has no owner (the `THREAD_ID` column is `NULL`).
- When a mutex object is destroyed, the corresponding row is removed from `mutex_instances`.

By performing queries on both of the following tables, a monitoring application or a DBA can detect bottlenecks or deadlocks between threads that involve mutexes:

- `events_waits_current`, to see what mutex a thread is waiting for
- `mutex_instances`, to see which other thread currently owns a mutex

#### 29.12.3.4 The `rwlock_instances` Table

The `rwlock_instances` table lists all the `rwlock` (read write lock) instances seen by the Performance Schema while the server executes. An `rwlock` is a synchronization mechanism used in the code to enforce that threads at a given time can have access to some common resource following certain rules. The resource is said to be “protected” by the `rwlock`. The access is either shared (many threads can have a read lock at the same time), exclusive (only one thread can have a write lock at a given time), or shared-exclusive (a thread can have a write lock while permitting inconsistent reads by other threads). Shared-exclusive access is otherwise known as an `sxlock` and optimizes concurrency and improves scalability for read-write workloads.

Depending on how many threads are requesting a lock, and the nature of the locks requested, access can be either granted in shared mode, exclusive mode, shared-exclusive mode or not granted at all, waiting for other threads to finish first.

The `rwlock_instances` table has these columns:

- `NAME`

The instrument name associated with the lock.

- `OBJECT_INSTANCE_BEGIN`

The address in memory of the instrumented lock.

- `WRITE_LOCKED_BY_THREAD_ID`

When a thread currently has an `rwlock` locked in exclusive (write) mode, `WRITE_LOCKED_BY_THREAD_ID` is the `THREAD_ID` of the locking thread, otherwise it is `NULL`.

- `READ_LOCKED_BY_COUNT`

When a thread currently has an `rwlock` locked in shared (read) mode, `READ_LOCKED_BY_COUNT` is incremented by 1. This is a counter only, so it cannot be used directly to find which thread holds a read lock, but it can be used to see whether there is a read contention on an `rwlock`, and see how many readers are currently active.

The `rwlock_instances` table has these indexes:

- Primary key on `(OBJECT_INSTANCE_BEGIN)`
- Index on `(NAME)`
- Index on `(WRITE_LOCKED_BY_THREAD_ID)`

`TRUNCATE TABLE` is not permitted for the `rwlock_instances` table.

By performing queries on both of the following tables, a monitoring application or a DBA may detect some bottlenecks or deadlocks between threads that involve locks:

- `events_waits_current`, to see what `rwlock` a thread is waiting for
- `rwlock_instances`, to see which other thread currently owns an `rwlock`

There is a limitation: The `rwlock_instances` can be used only to identify the thread holding a write lock, but not the threads holding a read lock.

### 29.12.3.5 The `socket_instances` Table

The `socket_instances` table provides a real-time snapshot of the active connections to the MySQL server. The table contains one row per TCP/IP or Unix socket file connection. Information available in this table provides a real-time snapshot of the active connections to the server. (Additional information is available in socket summary tables, including network activity such as socket operations and number of bytes transmitted and received; see [Section 29.12.20.9, “Socket Summary Tables”](#)).

```
mysql> SELECT * FROM performance_schema.socket_instances\G
***** 1. row *****
 EVENT_NAME: wait/io/socket/sql/server_unix_socket
OBJECT_INSTANCE_BEGIN: 4316619408
 THREAD_ID: 1
 SOCKET_ID: 16
 IP:
 PORT: 0
 STATE: ACTIVE
***** 2. row *****
 EVENT_NAME: wait/io/socket/sql/client_connection
OBJECT_INSTANCE_BEGIN: 4316644608
 THREAD_ID: 21
 SOCKET_ID: 39
 IP: 127.0.0.1
 PORT: 55233
 STATE: ACTIVE
***** 3. row *****
 EVENT_NAME: wait/io/socket/sql/server_tcpip_socket
OBJECT_INSTANCE_BEGIN: 4316699040
 THREAD_ID: 1
 SOCKET_ID: 14
 IP: 0.0.0.0
 PORT: 50603
 STATE: ACTIVE
```

Socket instruments have names of the form `wait/io/socket/sql/socket_type` and are used like this:

1. The server has a listening socket for each network protocol that it supports. The instruments associated with listening sockets for TCP/IP or Unix socket file connections have a `socket_type` value of `server_tcpip_socket` or `server_unix_socket`, respectively.
2. When a listening socket detects a connection, the server transfers the connection to a new socket managed by a separate thread. The instrument for the new connection thread has a `socket_type` value of `client_connection`.
3. When a connection terminates, the row in `socket_instances` corresponding to it is deleted.

The `socket_instances` table has these columns:

- [EVENT\\_NAME](#)

The name of the `wait/io/socket/*` instrument that produced the event. This is a [NAME](#) value from the `setup_instruments` table. Instrument names may have multiple parts and form a hierarchy, as discussed in [Section 29.6, “Performance Schema Instrument Naming Conventions”](#).

- [OBJECT\\_INSTANCE\\_BEGIN](#)

This column uniquely identifies the socket. The value is the address of an object in memory.

- [THREAD\\_ID](#)

The internal thread identifier assigned by the server. Each socket is managed by a single thread, so each socket can be mapped to a thread which can be mapped to a server process.

- [SOCKET\\_ID](#)

The internal file handle assigned to the socket.

- [IP](#)

The client IP address. The value may be either an IPv4 or IPv6 address, or blank to indicate a Unix socket file connection.

- [PORT](#)

The TCP/IP port number, in the range from 0 to 65535.

- [STATE](#)

The socket status, either [IDLE](#) or [ACTIVE](#). Wait times for active sockets are tracked using the corresponding socket instrument. Wait times for idle sockets are tracked using the [idle](#) instrument.

A socket is idle if it is waiting for a request from the client. When a socket becomes idle, the event row in `socket_instances` that is tracking the socket switches from a status of [ACTIVE](#) to [IDLE](#). The [EVENT\\_NAME](#) value remains `wait/io/socket/*`, but timing for the instrument is suspended. Instead, an event is generated in the `events_waits_current` table with an [EVENT\\_NAME](#) value of [idle](#).

When the next request is received, the [idle](#) event terminates, the socket instance switches from [IDLE](#) to [ACTIVE](#), and timing of the socket instrument resumes.

The `socket_instances` table has these indexes:

- Primary key on ([OBJECT\\_INSTANCE\\_BEGIN](#))
- Index on ([THREAD\\_ID](#))
- Index on ([SOCKET\\_ID](#))
- Index on ([IP](#), [PORT](#))

`TRUNCATE TABLE` is not permitted for the `socket_instances` table.

The [IP:PORT](#) column combination value identifies the connection. This combination value is used in the [OBJECT\\_NAME](#) column of the `events_waits_xxx` tables, to identify the connection from which socket events come:

- For the Unix domain listener socket (`server_unix_socket`), the port is 0, and the IP is ''.
- For client connections via the Unix domain listener (`client_connection`), the port is 0, and the IP is ''.

- For the TCP/IP server listener socket (`server_tcpip_socket`), the port is always the master port (for example, 3306), and the IP is always `0.0.0.0`.
- For client connections via the TCP/IP listener (`client_connection`), the port is whatever the server assigns, but never 0. The IP is the IP of the originating host (`127.0.0.1` or `::1` for the local host)

## 29.12.4 Performance Schema Wait Event Tables

The Performance Schema instruments waits, which are events that take time. Within the event hierarchy, wait events nest within stage events, which nest within statement events, which nest within transaction events.

These tables store wait events:

- `events_waits_current`: The current wait event for each thread.
- `events_waits_history`: The most recent wait events that have ended per thread.
- `events_waits_history_long`: The most recent wait events that have ended globally (across all threads).

The following sections describe the wait event tables. There are also summary tables that aggregate information about wait events; see [Section 29.12.20.1, “Wait Event Summary Tables”](#).

For more information about the relationship between the three wait event tables, see [Section 29.9, “Performance Schema Tables for Current and Historical Events”](#).

## Configuring Wait Event Collection

To control whether to collect wait events, set the state of the relevant instruments and consumers:

- The `setup_instruments` table contains instruments with names that begin with `wait`. Use these instruments to enable or disable collection of individual wait event classes.
- The `setup_consumers` table contains consumer values with names corresponding to the current and historical wait event table names. Use these consumers to filter collection of wait events.

Some wait instruments are enabled by default; others are disabled. For example:

```
mysql> SELECT NAME, ENABLED, TIMED
 FROM performance_schema.setup_instruments
 WHERE NAME LIKE 'wait/io/file/innodb%';
+-----+-----+-----+
| NAME | ENABLED | TIMED |
+-----+-----+-----+
| wait/io/file/innodb/innodb_tablespace_open_file | YES | YES |
| wait/io/file/innodb/innodb_data_file | YES | YES |
| wait/io/file/innodb/innodb_log_file | YES | YES |
| wait/io/file/innodb/innodb_temp_file | YES | YES |
| wait/io/file/innodb/innodb_arch_file | YES | YES |
| wait/io/file/innodb/innodb_clone_file | YES | YES |
+-----+-----+-----+
mysql> SELECT NAME, ENABLED, TIMED
 FROM performance_schema.setup_instruments
 WHERE NAME LIKE 'wait/io/socket%';
+-----+-----+-----+
| NAME | ENABLED | TIMED |
+-----+-----+-----+
| wait/io/socket/sql/server_tcpip_socket | NO | NO |
| wait/io/socket/sql/server_unix_socket | NO | NO |
| wait/io/socket/sql/client_connection | NO | NO |
+-----+-----+-----+
```

The wait consumers are disabled by default:

```
mysql> SELECT *
 FROM performance_schema.setup_consumers
 WHERE NAME LIKE 'events_waits%';
+-----+-----+
| NAME | ENABLED |
+-----+-----+
| events_waits_current | NO |
| events_waits_history | NO |
| events_waits_history_long | NO |
+-----+-----+
```

To control wait event collection at server startup, use lines like these in your `my.cnf` file:

- Enable:

```
[mysqld]
performance-schema-instrument='wait/%=ON'
performance-schema-consumer-events-waits-current=ON
performance-schema-consumer-events-waits-history=ON
performance-schema-consumer-events-waits-history-long=ON
```

- Disable:

```
[mysqld]
performance-schema-instrument='wait/%=OFF'
performance-schema-consumer-events-waits-current=OFF
performance-schema-consumer-events-waits-history=OFF
performance-schema-consumer-events-waits-history-long=OFF
```

To control wait event collection at runtime, update the `setup_instruments` and `setup_consumers` tables:

- Enable:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'YES', TIMED = 'YES'
WHERE NAME LIKE 'wait/%';

UPDATE performance_schema.setup_consumers
SET ENABLED = 'YES'
WHERE NAME LIKE 'events_waits%';
```

- Disable:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'NO', TIMED = 'NO'
WHERE NAME LIKE 'wait/%';

UPDATE performance_schema.setup_consumers
SET ENABLED = 'NO'
WHERE NAME LIKE 'events_waits%';
```

To collect only specific wait events, enable only the corresponding wait instruments. To collect wait events only for specific wait event tables, enable the wait instruments but only the wait consumers corresponding to the desired tables.

For additional information about configuring event collection, see [Section 29.3, “Performance Schema Startup Configuration”](#), and [Section 29.4, “Performance Schema Runtime Configuration”](#).

#### 29.12.4.1 The `events_waits_current` Table

The `events_waits_current` table contains current wait events. The table stores one row per thread showing the current status of the thread's most recent monitored wait event, so there is no system variable for configuring the table size.

Of the tables that contain wait event rows, `events_waits_current` is the most fundamental. Other tables that contain wait event rows are logically derived from the current events. For example, the `events_waits_history` and `events_waits_history_long` tables are collections of the most

recent wait events that have ended, up to a maximum number of rows per thread and globally across all threads, respectively.

For more information about the relationship between the three wait event tables, see [Section 29.9, “Performance Schema Tables for Current and Historical Events”](#).

For information about configuring whether to collect wait events, see [Section 29.12.4, “Performance Schema Wait Event Tables”](#).

The `events_waits_current` table has these columns:

- `THREAD_ID`, `EVENT_ID`

The thread associated with the event and the thread current event number when the event starts.

The `THREAD_ID` and `EVENT_ID` values taken together uniquely identify the row. No two rows have the same pair of values.

- `END_EVENT_ID`

This column is set to `NULL` when the event starts and updated to the thread current event number when the event ends.

- `EVENT_NAME`

The name of the instrument that produced the event. This is a `NAME` value from the `setup_instruments` table. Instrument names may have multiple parts and form a hierarchy, as discussed in [Section 29.6, “Performance Schema Instrument Naming Conventions”](#).

- `SOURCE`

The name of the source file containing the instrumented code that produced the event and the line number in the file at which the instrumentation occurs. This enables you to check the source to determine exactly what code is involved. For example, if a mutex or lock is being blocked, you can check the context in which this occurs.

- `TIMER_START`, `TIMER_END`, `TIMER_WAIT`

Timing information for the event. The unit for these values is picoseconds (trillionths of a second).

The `TIMER_START` and `TIMER_END` values indicate when event timing started and ended.

`TIMER_WAIT` is the event elapsed time (duration).

If an event has not finished, `TIMER_END` is the current timer value and `TIMER_WAIT` is the time elapsed so far (`TIMER_END - TIMER_START`).

If an event is produced from an instrument that has `TIMED = NO`, timing information is not collected, and `TIMER_START`, `TIMER_END`, and `TIMER_WAIT` are all `NULL`.

For discussion of picoseconds as the unit for event times and factors that affect time values, see [Section 29.4.1, “Performance Schema Event Timing”](#).

- `SPINS`

For a mutex, the number of spin rounds. If the value is `NULL`, the code does not use spin rounds or spinning is not instrumented.

- `OBJECT_SCHEMA`, `OBJECT_NAME`, `OBJECT_TYPE`, `OBJECT_INSTANCE_BEGIN`

These columns identify the object “being acted on.” What that means depends on the object type.

For a synchronization object (`cond`, `mutex`, `rwlock`):

- `OBJECT_SCHEMA`, `OBJECT_NAME`, and `OBJECT_TYPE` are `NULL`.

- `OBJECT_INSTANCE_BEGIN` is the address of the synchronization object in memory.

For a file I/O object:

- `OBJECT_SCHEMA` is `NULL`.
- `OBJECT_NAME` is the file name.
- `OBJECT_TYPE` is `FILE`.
- `OBJECT_INSTANCE_BEGIN` is an address in memory.

For a socket object:

- `OBJECT_NAME` is the `IP:PORT` value for the socket.
- `OBJECT_INSTANCE_BEGIN` is an address in memory.

For a table I/O object:

- `OBJECT_SCHEMA` is the name of the schema that contains the table.
- `OBJECT_NAME` is the table name.
- `OBJECT_TYPE` is `TABLE` for a persistent base table or `TEMPORARY TABLE` for a temporary table.
- `OBJECT_INSTANCE_BEGIN` is an address in memory.

An `OBJECT_INSTANCE_BEGIN` value itself has no meaning, except that different values indicate different objects. `OBJECT_INSTANCE_BEGIN` can be used for debugging. For example, it can be used with `GROUP BY OBJECT_INSTANCE_BEGIN` to see whether the load on 1,000 mutexes (that protect, say, 1,000 pages or blocks of data) is spread evenly or just hitting a few bottlenecks. This can help you correlate with other sources of information if you see the same object address in a log file or another debugging or performance tool.

- `INDEX_NAME`

The name of the index used. `PRIMARY` indicates the table primary index. `NULL` means that no index was used.

- `NESTING_EVENT_ID`

The `EVENT_ID` value of the event within which this event is nested.

- `NESTING_EVENT_TYPE`

The nesting event type. The value is `TRANSACTION`, `STATEMENT`, `STAGE`, or `WAIT`.

- `OPERATION`

The type of operation performed, such as `lock`, `read`, or `write`.

- `NUMBER_OF_BYTES`

The number of bytes read or written by the operation. For table I/O waits (events for the `wait/io/table/sql/handler` instrument), `NUMBER_OF_BYTES` indicates the number of rows. If the value is greater than 1, the event is for a batch I/O operation. The following discussion describes the difference between exclusively single-row reporting and reporting that reflects batch I/O.

MySQL executes joins using a nested-loop implementation. The job of the Performance Schema instrumentation is to provide row count and accumulated execution time per table in the join. Assume a join query of the following form that is executed using a table join order of `t1`, `t2`, `t3`:

```
SELECT ... FROM t1 JOIN t2 ON ... JOIN t3 ON ...
```

Table “fanout” is the increase or decrease in number of rows from adding a table during join processing. If the fanout for table `t3` is greater than 1, the majority of row-fetch operations are for that table. Suppose that the join accesses 10 rows from `t1`, 20 rows from `t2` per row from `t1`, and 30 rows from `t3` per row of table `t2`. With single-row reporting, the total number of instrumented operations is:

$$10 + (10 * 20) + (10 * 20 * 30) = 6210$$

A significant reduction in the number of instrumented operations is achievable by aggregating them per scan (that is, per unique combination of rows from `t1` and `t2`). With batch I/O reporting, the Performance Schema produces an event for each scan of the innermost table `t3` rather than for each row, and the number of instrumented row operations reduces to:

$$10 + (10 * 20) + (10 * 20) = 410$$

That is a reduction of 93%, illustrating how the batch-reporting strategy significantly reduces Performance Schema overhead for table I/O by reducing the number of reporting calls. The tradeoff is lesser accuracy for event timing. Rather than time for an individual row operation as in per-row reporting, timing for batch I/O includes time spent for operations such as join buffering, aggregation, and returning rows to the client.

For batch I/O reporting to occur, these conditions must be true:

- Query execution accesses the innermost table of a query block (for a single-table query, that table counts as innermost)
- Query execution does not request a single row from the table (so, for example, `eq_ref` access prevents use of batch reporting)
- Query execution does not evaluate a subquery containing table access for the table
- `FLAGS`

Reserved for future use.

The `events_waits_current` table has these indexes:

- Primary key on (`THREAD_ID`, `EVENT_ID`)

`TRUNCATE TABLE` is permitted for the `events_waits_current` table. It removes the rows.

#### 29.12.4.2 The `events_waits_history` Table

The `events_waits_history` table contains the `N` most recent wait events that have ended per thread. Wait events are not added to the table until they have ended. When the table contains the maximum number of rows for a given thread, the oldest thread row is discarded when a new row for that thread is added. When a thread ends, all its rows are discarded.

The Performance Schema autosizes the value of `N` during server startup. To set the number of rows per thread explicitly, set the `performance_schema_events_waits_history_size` system variable at server startup.

The `events_waits_history` table has the same columns and indexing as `events_waits_current`. See [Section 29.12.4.1, “The `events\_waits\_current` Table”](#).

`TRUNCATE TABLE` is permitted for the `events_waits_history` table. It removes the rows.

For more information about the relationship between the three wait event tables, see [Section 29.9, “Performance Schema Tables for Current and Historical Events”](#).

For information about configuring whether to collect wait events, see [Section 29.12.4, “Performance Schema Wait Event Tables”](#).

#### 29.12.4.3 The `events_waits_history_long` Table

The `events_waits_history_long` table contains  $N$  the most recent wait events that have ended globally, across all threads. Wait events are not added to the table until they have ended. When the table becomes full, the oldest row is discarded when a new row is added, regardless of which thread generated either row.

The Performance Schema autosizes the value of  $N$  during server startup. To set the table size explicitly, set the `performance_schema_events_waits_history_long_size` system variable at server startup.

The `events_waits_history_long` table has the same columns as `events_waits_current`. See [Section 29.12.4.1, “The `events\_waits\_current` Table”](#). Unlike `events_waits_current`, `events_waits_history_long` has no indexing.

`TRUNCATE TABLE` is permitted for the `events_waits_history_long` table. It removes the rows.

For more information about the relationship between the three wait event tables, see [Section 29.9, “Performance Schema Tables for Current and Historical Events”](#).

For information about configuring whether to collect wait events, see [Section 29.12.4, “Performance Schema Wait Event Tables”](#).

### 29.12.5 Performance Schema Stage Event Tables

The Performance Schema instruments stages, which are steps during the statement-execution process, such as parsing a statement, opening a table, or performing a `filesort` operation. Stages correspond to the thread states displayed by `SHOW PROCESSLIST` or that are visible in the Information Schema `PROCESSLIST` table. Stages begin and end when state values change.

Within the event hierarchy, wait events nest within stage events, which nest within statement events, which nest within transaction events.

These tables store stage events:

- `events_stages_current`: The current stage event for each thread.
- `events_stages_history`: The most recent stage events that have ended per thread.
- `events_stages_history_long`: The most recent stage events that have ended globally (across all threads).

The following sections describe the stage event tables. There are also summary tables that aggregate information about stage events; see [Section 29.12.20.2, “Stage Summary Tables”](#).

For more information about the relationship between the three stage event tables, see [Section 29.9, “Performance Schema Tables for Current and Historical Events”](#).

- [Configuring Stage Event Collection](#)
- [Stage Event Progress Information](#)

#### Configuring Stage Event Collection

To control whether to collect stage events, set the state of the relevant instruments and consumers:

- The `setup_instruments` table contains instruments with names that begin with `stage`. Use these instruments to enable or disable collection of individual stage event classes.

## Performance Schema Stage Event Tables

- The `setup_consumers` table contains consumer values with names corresponding to the current and historical stage event table names. Use these consumers to filter collection of stage events.

Other than those instruments that provide statement progress information, the stage instruments are disabled by default. For example:

```
mysql> SELECT NAME, ENABLED, TIMED
 FROM performance_schema.setup_instruments
 WHERE NAME RLIKE 'stage/sql/[a-c]';
+-----+-----+-----+
| NAME | ENABLED | TIMED |
+-----+-----+-----+
| stage/sql/After create | NO | NO |
| stage/sql/allocating local table | NO | NO |
| stage/sql/altering table | NO | NO |
| stage/sql/committing alter table to storage engine | NO | NO |
| stage/sql/Changing master | NO | NO |
| stage/sql/Checking master version | NO | NO |
| stage/sql/checking permissions | NO | NO |
| stage/sql/cleaning up | NO | NO |
| stage/sql/closing tables | NO | NO |
| stage/sql/Connecting to master | NO | NO |
| stage/sql/converting HEAP to MyISAM | NO | NO |
| stage/sql/Copying to group table | NO | NO |
| stage/sql/Copying to tmp table | NO | NO |
| stage/sql/copy to tmp table | NO | NO |
| stage/sql/Creating sort index | NO | NO |
| stage/sql/creating table | NO | NO |
| stage/sql/Creating tmp table | NO | NO |
+-----+-----+-----+
```

Stage event instruments that provide statement progress information are enabled and timed by default:

```
mysql> SELECT NAME, ENABLED, TIMED
 FROM performance_schema.setup_instruments
 WHERE ENABLED='YES' AND NAME LIKE "stage/%";
+-----+-----+-----+
| NAME | ENABLED | TIMED |
+-----+-----+-----+
| stage/sql/copy to tmp table | YES | YES |
| stage/sql/Applying batch of row changes (write) | YES | YES |
| stage/sql/Applying batch of row changes (update) | YES | YES |
| stage/sql/Applying batch of row changes (delete) | YES | YES |
| stage/innodb/alter table (end) | YES | YES |
| stage/innodb/alter table (flush) | YES | YES |
| stage/innodb/alter table (insert) | YES | YES |
| stage/innodb/alter table (log apply index) | YES | YES |
| stage/innodb/alter table (log apply table) | YES | YES |
| stage/innodb/alter table (merge sort) | YES | YES |
| stage/innodb/alter table (read PK and internal sort) | YES | YES |
| stage/innodb/buffer pool load | YES | YES |
| stage/innodb/clone (file copy) | YES | YES |
| stage/innodb/clone (redo copy) | YES | YES |
| stage/innodb/clone (page copy) | YES | YES |
+-----+-----+-----+
```

The stage consumers are disabled by default:

```
mysql> SELECT *
 FROM performance_schema.setup_consumers
 WHERE NAME LIKE 'events_stages%';
+-----+-----+
| NAME | ENABLED |
+-----+-----+
| events_stages_current | NO |
| events_stages_history | NO |
| events_stages_history_long | NO |
+-----+-----+
```

To control stage event collection at server startup, use lines like these in your `my.cnf` file:

- Enable:

```
[mysqld]
performance-schema-instrument='stage/%=ON'
performance-schema-consumer-events-stages-current=ON
performance-schema-consumer-events-stages-history=ON
performance-schema-consumer-events-stages-history-long=ON
```

- Disable:

```
[mysqld]
performance-schema-instrument='stage/%=OFF'
performance-schema-consumer-events-stages-current=OFF
performance-schema-consumer-events-stages-history=OFF
performance-schema-consumer-events-stages-history-long=OFF
```

To control stage event collection at runtime, update the `setup_instruments` and `setup_consumers` tables:

- Enable:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'YES', TIMED = 'YES'
WHERE NAME LIKE 'stage/%';

UPDATE performance_schema.setup_consumers
SET ENABLED = 'YES'
WHERE NAME LIKE 'events_stages%';
```

- Disable:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'NO', TIMED = 'NO'
WHERE NAME LIKE 'stage/%';

UPDATE performance_schema.setup_consumers
SET ENABLED = 'NO'
WHERE NAME LIKE 'events_stages%';
```

To collect only specific stage events, enable only the corresponding stage instruments. To collect stage events only for specific stage event tables, enable the stage instruments but only the stage consumers corresponding to the desired tables.

For additional information about configuring event collection, see [Section 29.3, “Performance Schema Startup Configuration”](#), and [Section 29.4, “Performance Schema Runtime Configuration”](#).

## Stage Event Progress Information

The Performance Schema stage event tables contain two columns that, taken together, provide a stage progress indicator for each row:

- `WORK_COMPLETED`: The number of work units completed for the stage
- `WORK_ESTIMATED`: The number of work units expected for the stage

Each column is `NULL` if no progress information is provided for an instrument. Interpretation of the information, if it is available, depends entirely on the instrument implementation. The Performance Schema tables provide a container to store progress data, but make no assumptions about the semantics of the metric itself:

- A “work unit” is an integer metric that increases over time during execution, such as the number of bytes, rows, files, or tables processed. The definition of “work unit” for a particular instrument is left to the instrumentation code providing the data.
- The `WORK_COMPLETED` value can increase one or many units at a time, depending on the instrumented code.

- The `WORK_ESTIMATED` value can change during the stage, depending on the instrumented code.

Instrumentation for a stage event progress indicator can implement any of the following behaviors:

- No progress instrumentation

This is the most typical case, where no progress data is provided. The `WORK_COMPLETED` and `WORK_ESTIMATED` columns are both `NULL`.

- Unbounded progress instrumentation

Only the `WORK_COMPLETED` column is meaningful. No data is provided for the `WORK_ESTIMATED` column, which displays 0.

By querying the `events_stages_current` table for the monitored session, a monitoring application can report how much work has been performed so far, but cannot report whether the stage is near completion. Currently, no stages are instrumented like this.

- Bounded progress instrumentation

The `WORK_COMPLETED` and `WORK_ESTIMATED` columns are both meaningful.

This type of progress indicator is appropriate for an operation with a defined completion criterion, such as the table-copy instrument described later. By querying the `events_stages_current` table for the monitored session, a monitoring application can report how much work has been performed so far, and can report the overall completion percentage for the stage, by computing the `WORK_COMPLETED / WORK_ESTIMATED` ratio.

The `stage/sql/copy to tmp table` instrument illustrates how progress indicators work. During execution of an `ALTER TABLE` statement, the `stage/sql/copy to tmp table` stage is used, and this stage can execute potentially for a long time, depending on the size of the data to copy.

The table-copy task has a defined termination (all rows copied), and the `stage/sql/copy to tmp table` stage is instrumented to provide bounded progress information: The work unit used is number of rows copied, `WORK_COMPLETED` and `WORK_ESTIMATED` are both meaningful, and their ratio indicates task percentage complete.

To enable the instrument and the relevant consumers, execute these statements:

```
UPDATE performance_schema.setup_instruments
SET ENABLED='YES'
WHERE NAME='stage/sql/copy to tmp table';

UPDATE performance_schema.setup_consumers
SET ENABLED='YES'
WHERE NAME LIKE 'events_stages_%';
```

To see the progress of an ongoing `ALTER TABLE` statement, select from the `events_stages_current` table.

### 29.12.5.1 The `events_stages_current` Table

The `events_stages_current` table contains current stage events. The table stores one row per thread showing the current status of the thread's most recent monitored stage event, so there is no system variable for configuring the table size.

Of the tables that contain stage event rows, `events_stages_current` is the most fundamental. Other tables that contain stage event rows are logically derived from the current events. For example, the `events_stages_history` and `events_stages_history_long` tables are collections of the most recent stage events that have ended, up to a maximum number of rows per thread and globally across all threads, respectively.

For more information about the relationship between the three stage event tables, see [Section 29.9, “Performance Schema Tables for Current and Historical Events”](#).

For information about configuring whether to collect stage events, see [Section 29.12.5, “Performance Schema Stage Event Tables”](#).

The `events_stages_current` table has these columns:

- `THREAD_ID`, `EVENT_ID`

The thread associated with the event and the thread current event number when the event starts. The `THREAD_ID` and `EVENT_ID` values taken together uniquely identify the row. No two rows have the same pair of values.

- `END_EVENT_ID`

This column is set to `NULL` when the event starts and updated to the thread current event number when the event ends.

- `EVENT_NAME`

The name of the instrument that produced the event. This is a `NAME` value from the `setup_instruments` table. Instrument names may have multiple parts and form a hierarchy, as discussed in [Section 29.6, “Performance Schema Instrument Naming Conventions”](#).

- `SOURCE`

The name of the source file containing the instrumented code that produced the event and the line number in the file at which the instrumentation occurs. This enables you to check the source to determine exactly what code is involved.

- `TIMER_START`, `TIMER_END`, `TIMER_WAIT`

Timing information for the event. The unit for these values is picoseconds (trillions of a second). The `TIMER_START` and `TIMER_END` values indicate when event timing started and ended. `TIMER_WAIT` is the event elapsed time (duration).

If an event has not finished, `TIMER_END` is the current timer value and `TIMER_WAIT` is the time elapsed so far (`TIMER_END - TIMER_START`).

If an event is produced from an instrument that has `TIMED = NO`, timing information is not collected, and `TIMER_START`, `TIMER_END`, and `TIMER_WAIT` are all `NULL`.

For discussion of picoseconds as the unit for event times and factors that affect time values, see [Section 29.4.1, “Performance Schema Event Timing”](#).

- `WORK_COMPLETED`, `WORK_ESTIMATED`

These columns provide stage progress information, for instruments that have been implemented to produce such information. `WORK_COMPLETED` indicates how many work units have been completed for the stage, and `WORK_ESTIMATED` indicates how many work units are expected for the stage. For more information, see [Stage Event Progress Information](#).

- `NESTING_EVENT_ID`

The `EVENT_ID` value of the event within which this event is nested. The nesting event for a stage event is usually a statement event.

- `NESTING_EVENT_TYPE`

The nesting event type. The value is `TRANSACTION`, `STATEMENT`, `STAGE`, or `WAIT`.

The `events_stages_current` table has these indexes:

- Primary key on `(THREAD_ID, EVENT_ID)`

`TRUNCATE TABLE` is permitted for the `events_stages_current` table. It removes the rows.

### 29.12.5.2 The `events_stages_history` Table

The `events_stages_history` table contains the `N` most recent stage events that have ended per thread. Stage events are not added to the table until they have ended. When the table contains the maximum number of rows for a given thread, the oldest thread row is discarded when a new row for that thread is added. When a thread ends, all its rows are discarded.

The Performance Schema autosizes the value of `N` during server startup. To set the number of rows per thread explicitly, set the `performance_schema_events_stages_history_size` system variable at server startup.

The `events_stages_history` table has the same columns and indexing as `events_stages_current`. See [Section 29.12.5.1, “The `events\_stages\_current` Table”](#).

`TRUNCATE TABLE` is permitted for the `events_stages_history` table. It removes the rows.

For more information about the relationship between the three stage event tables, see [Section 29.9, “Performance Schema Tables for Current and Historical Events”](#).

For information about configuring whether to collect stage events, see [Section 29.12.5, “Performance Schema Stage Event Tables”](#).

### 29.12.5.3 The `events_stages_history_long` Table

The `events_stages_history_long` table contains the `N` most recent stage events that have ended globally, across all threads. Stage events are not added to the table until they have ended. When the table becomes full, the oldest row is discarded when a new row is added, regardless of which thread generated either row.

The Performance Schema autosizes the value of `N` during server startup. To set the table size explicitly, set the `performance_schema_events_stages_history_long_size` system variable at server startup.

The `events_stages_history_long` table has the same columns as `events_stages_current`. See [Section 29.12.5.1, “The `events\_stages\_current` Table”](#). Unlike `events_stages_current`, `events_stages_history_long` has no indexing.

`TRUNCATE TABLE` is permitted for the `events_stages_history_long` table. It removes the rows.

For more information about the relationship between the three stage event tables, see [Section 29.9, “Performance Schema Tables for Current and Historical Events”](#).

For information about configuring whether to collect stage events, see [Section 29.12.5, “Performance Schema Stage Event Tables”](#).

## 29.12.6 Performance Schema Statement Event Tables

The Performance Schema instruments statement execution. Statement events occur at a high level of the event hierarchy. Within the event hierarchy, wait events nest within stage events, which nest within statement events, which nest within transaction events.

These tables store statement events:

- `events_statements_current`: The current statement event for each thread.
- `events_statements_history`: The most recent statement events that have ended per thread.

- `events_statements_history_long`: The most recent statement events that have ended globally (across all threads).
- `prepared_statements_instances`: Prepared statement instances and statistics

The following sections describe the statement event tables. There are also summary tables that aggregate information about statement events; see [Section 29.12.20.3, “Statement Summary Tables”](#).

For more information about the relationship between the three `events_statements_xxx` event tables, see [Section 29.9, “Performance Schema Tables for Current and Historical Events”](#).

- [Configuring Statement Event Collection](#)
- [Statement Monitoring](#)

## Configuring Statement Event Collection

To control whether to collect statement events, set the state of the relevant instruments and consumers:

- The `setup_instruments` table contains instruments with names that begin with `statement`. Use these instruments to enable or disable collection of individual statement event classes.
- The `setup_consumers` table contains consumer values with names corresponding to the current and historical statement event table names, and the statement digest consumer. Use these consumers to filter collection of statement events and statement digesting.

The statement instruments are enabled by default, and the `events_statements_current`, `events_statements_history`, and `statements_digest` statement consumers are enabled by default:

```
mysql> SELECT NAME, ENABLED, TIMED
 FROM performance_schema.setup_instruments
 WHERE NAME LIKE 'statement/%';
+-----+-----+-----+
| NAME | ENABLED | TIMED |
+-----+-----+-----+
| statement/sql/select | YES | YES |
| statement/sql/create_table | YES | YES |
| statement/sql/create_index | YES | YES |
...
| statement/sp/stmt | YES | YES |
| statement/sp/set | YES | YES |
| statement/sp/set_trigger_field | YES | YES |
| statement/scheduler/event | YES | YES |
| statement/com/Sleep | YES | YES |
| statement/com/Quit | YES | YES |
| statement/com/Init_DB | YES | YES |
...
| statement/abstract/Query | YES | YES |
| statement/abstract/new_packet | YES | YES |
| statement/abstract/relay_log | YES | YES |
+-----+-----+-----+
```

```
mysql> SELECT *
 FROM performance_schema.setup_consumers
 WHERE NAME LIKE '%statements%';
+-----+-----+
| NAME | ENABLED |
+-----+-----+
| events_statements_current | YES |
| events_statements_history | YES |
| events_statements_history_long | NO |
| statements_digest | YES |
+-----+-----+
```

To control statement event collection at server startup, use lines like these in your `my.cnf` file:

- Enable:

```
[mysqld]
performance-schema-instrument='statement/%%=ON'
performance-schema-consumer-events-statements-current=ON
performance-schema-consumer-events-statements-history=ON
performance-schema-consumer-events-statements-history-long=ON
performance-schema-consumer-statements-digest=ON
```

- Disable:

```
[mysqld]
performance-schema-instrument='statement/%%=OFF'
performance-schema-consumer-events-statements-current=OFF
performance-schema-consumer-events-statements-history=OFF
performance-schema-consumer-events-statements-history-long=OFF
performance-schema-consumer-statements-digest=OFF
```

To control statement event collection at runtime, update the `setup_instruments` and `setup_consumers` tables:

- Enable:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'YES', TIMED = 'YES'
WHERE NAME LIKE 'statement/%%';

UPDATE performance_schema.setup_consumers
SET ENABLED = 'YES'
WHERE NAME LIKE '%statements%';
```

- Disable:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'NO', TIMED = 'NO'
WHERE NAME LIKE 'statement/%%';

UPDATE performance_schema.setup_consumers
SET ENABLED = 'NO'
WHERE NAME LIKE '%statements%';
```

To collect only specific statement events, enable only the corresponding statement instruments. To collect statement events only for specific statement event tables, enable the statement instruments but only the statement consumers corresponding to the desired tables.

For additional information about configuring event collection, see [Section 29.3, “Performance Schema Startup Configuration”](#), and [Section 29.4, “Performance Schema Runtime Configuration”](#).

## Statement Monitoring

Statement monitoring begins from the moment the server sees that activity is requested on a thread, to the moment when all activity has ceased. Typically, this means from the time the server gets the first packet from the client to the time the server has finished sending the response. Statements within stored programs are monitored like other statements.

When the Performance Schema instruments a request (server command or SQL statement), it uses instrument names that proceed in stages from more general (or “abstract”) to more specific until it arrives at a final instrument name.

Final instrument names correspond to server commands and SQL statements:

- Server commands correspond to the `COM_xxx` codes defined in the `mysql_com.h` header file and processed in `sql/sql_parse.cc`. Examples are `COM_PING` and `COM_QUIT`. Instruments for commands have names that begin with `statement/com`, such as `statement/com/Ping` and `statement/com/Quit`.

- SQL statements are expressed as text, such as `DELETE FROM t1` or `SELECT * FROM t2`. Instruments for SQL statements have names that begin with `statement/sql`, such as `statement/sql/delete` and `statement/sql/select`.

Some final instrument names are specific to error handling:

- `statement/com/Error` accounts for messages received by the server that are out of band. It can be used to detect commands sent by clients that the server does not understand. This may be helpful for purposes such as identifying clients that are misconfigured or using a version of MySQL more recent than that of the server, or clients that are attempting to attack the server.
- `statement/sql/error` accounts for SQL statements that fail to parse. It can be used to detect malformed queries sent by clients. A query that fails to parse differs from a query that parses but fails due to an error during execution. For example, `SELECT * FROM` is malformed, and the `statement/sql/error` instrument is used. By contrast, `SELECT *` parses but fails with a `No tables used` error. In this case, `statement/sql/select` is used and the statement event contains information to indicate the nature of the error.

A request can be obtained from any of these sources:

- As a command or statement request from a client, which sends the request as packets
- As a statement string read from the relay log on a replica
- As an event from the Event Scheduler

The details for a request are not initially known and the Performance Schema proceeds from abstract to specific instrument names in a sequence that depends on the source of the request.

For a request received from a client:

1. When the server detects a new packet at the socket level, a new statement is started with an abstract instrument name of `statement/abstract/new_packet`.
2. When the server reads the packet number, it knows more about the type of request received, and the Performance Schema refines the instrument name. For example, if the request is a `COM_PING` packet, the instrument name becomes `statement/com/Ping` and that is the final name. If the request is a `COM_QUERY` packet, it is known to correspond to an SQL statement but not the particular type of statement. In this case, the instrument changes from one abstract name to a more specific but still abstract name, `statement/abstract/Query`, and the request requires further classification.
3. If the request is a statement, the statement text is read and given to the parser. After parsing, the exact statement type is known. If the request is, for example, an `INSERT` statement, the Performance Schema refines the instrument name from `statement/abstract/Query` to `statement/sql/insert`, which is the final name.

For a request read as a statement from the relay log on a replica:

1. Statements in the relay log are stored as text and are read as such. There is no network protocol, so the `statement/abstract/new_packet` instrument is not used. Instead, the initial instrument is `statement/abstract/relay_log`.
2. When the statement is parsed, the exact statement type is known. If the request is, for example, an `INSERT` statement, the Performance Schema refines the instrument name from `statement/abstract/Query` to `statement/sql/insert`, which is the final name.

The preceding description applies only for statement-based replication. For row-based replication, table I/O done on the replica as it processes row changes can be instrumented, but row events in the relay log do not appear as discrete statements.

For a request received from the Event Scheduler:

The event execution is instrumented using the name `statement/scheduler/event`. This is the final name.

Statements executed within the event body are instrumented using `statement/sql/*` names, without use of any preceding abstract instrument. An event is a stored program, and stored programs are precompiled in memory before execution. Consequently, there is no parsing at runtime and the type of each statement is known by the time it executes.

Statements executed within the event body are child statements. For example, if an event executes an `INSERT` statement, execution of the event itself is the parent, instrumented using `statement/scheduler/event`, and the `INSERT` is the child, instrumented using `statement/sql/insert`. The parent/child relationship holds *between* separate instrumented operations. This differs from the sequence of refinement that occurs *within* a single instrumented operation, from abstract to final instrument names.

For statistics to be collected for statements, it is not sufficient to enable only the final `statement/sql/*` instruments used for individual statement types. The abstract `statement/abstract/*` instruments must be enabled as well. This should not normally be an issue because all statement instruments are enabled by default. However, an application that enables or disables statement instruments selectively must take into account that disabling abstract instruments also disables statistics collection for the individual statement instruments. For example, to collect statistics for `INSERT` statements, `statement/sql/insert` must be enabled, but also `statement/abstract/new_packet` and `statement/abstract/Query`. Similarly, for replicated statements to be instrumented, `statement/abstract/relay_log` must be enabled.

No statistics are aggregated for abstract instruments such as `statement/abstract/Query` because no statement is ever classified with an abstract instrument as the final statement name.

### 29.12.6.1 The `events_statements_current` Table

The `events_statements_current` table contains current statement events. The table stores one row per thread showing the current status of the thread's most recent monitored statement event, so there is no system variable for configuring the table size.

Of the tables that contain statement event rows, `events_statements_current` is the most fundamental. Other tables that contain statement event rows are logically derived from the current events. For example, the `events_statements_history` and `events_statements_history_long` tables are collections of the most recent statement events that have ended, up to a maximum number of rows per thread and globally across all threads, respectively.

For more information about the relationship between the three `events_statements_xxx` event tables, see [Section 29.9, “Performance Schema Tables for Current and Historical Events”](#).

For information about configuring whether to collect statement events, see [Section 29.12.6, “Performance Schema Statement Event Tables”](#).

The `events_statements_current` table has these columns:

- `THREAD_ID`, `EVENT_ID`

The thread associated with the event and the thread current event number when the event starts. The `THREAD_ID` and `EVENT_ID` values taken together uniquely identify the row. No two rows have the same pair of values.

- `END_EVENT_ID`

This column is set to `NULL` when the event starts and updated to the thread current event number when the event ends.

- [EVENT\\_NAME](#)

The name of the instrument from which the event was collected. This is a [NAME](#) value from the [setup\\_instruments](#) table. Instrument names may have multiple parts and form a hierarchy, as discussed in [Section 29.6, “Performance Schema Instrument Naming Conventions”](#).

For SQL statements, the [EVENT\\_NAME](#) value initially is [statement/com/Query](#) until the statement is parsed, then changes to a more appropriate value, as described in [Section 29.12.6, “Performance Schema Statement Event Tables”](#).

- [SOURCE](#)

The name of the source file containing the instrumented code that produced the event and the line number in the file at which the instrumentation occurs. This enables you to check the source to determine exactly what code is involved.

- [TIMER\\_START](#), [TIMER\\_END](#), [TIMER\\_WAIT](#)

Timing information for the event. The unit for these values is picoseconds (trillions of a second). The [TIMER\\_START](#) and [TIMER\\_END](#) values indicate when event timing started and ended. [TIMER\\_WAIT](#) is the event elapsed time (duration).

If an event has not finished, [TIMER\\_END](#) is the current timer value and [TIMER\\_WAIT](#) is the time elapsed so far ([TIMER\\_END](#) – [TIMER\\_START](#)).

If an event is produced from an instrument that has [TIMED = NO](#), timing information is not collected, and [TIMER\\_START](#), [TIMER\\_END](#), and [TIMER\\_WAIT](#) are all [NULL](#).

For discussion of picoseconds as the unit for event times and factors that affect time values, see [Section 29.4.1, “Performance Schema Event Timing”](#).

- [LOCK\\_TIME](#)

The time spent waiting for table locks. This value is computed in microseconds but normalized to picoseconds for easier comparison with other Performance Schema timers.

- [SQL\\_TEXT](#)

The text of the SQL statement. For a command not associated with an SQL statement, the value is [NULL](#).

The maximum space available for statement display is 1024 bytes by default. To change this value, set the [performance\\_schema\\_max\\_sql\\_text\\_length](#) system variable at server startup. (Changing this value affects columns in other Performance Schema tables as well. See [Section 29.10, “Performance Schema Statement Digests and Sampling”](#).)

- [DIGEST](#)

The statement digest SHA-256 value as a string of 64 hexadecimal characters, or [NULL](#) if the [statements\\_digest](#) consumer is [no](#). For more information about statement digesting, see [Section 29.10, “Performance Schema Statement Digests and Sampling”](#).

- [DIGEST\\_TEXT](#)

The normalized statement digest text, or [NULL](#) if the [statements\\_digest](#) consumer is [no](#). For more information about statement digesting, see [Section 29.10, “Performance Schema Statement Digests and Sampling”](#).

The [performance\\_schema\\_max\\_digest\\_length](#) system variable determines the maximum number of bytes available per session for digest value storage. However, the display length of statement digests may be longer than the available buffer size due to encoding of statement elements such as keywords and literal values in digest buffer. Consequently, values

selected from the `DIGEST_TEXT` column of statement event tables may appear to exceed the `performance_schema_max_digest_length` value.

- `CURRENT_SCHEMA`

The default database for the statement, `NULL` if there is none.

- `OBJECT_SCHEMA`, `OBJECT_NAME`, `OBJECT_TYPE`

For nested statements (stored programs), these columns contain information about the parent statement. Otherwise they are `NULL`.

- `OBJECT_INSTANCE_BEGIN`

This column identifies the statement. The value is the address of an object in memory.

- `MYSQL_ERRNO`

The statement error number, from the statement diagnostics area.

- `RETURNED_SQLSTATE`

The statement SQLSTATE value, from the statement diagnostics area.

- `MESSAGE_TEXT`

The statement error message, from the statement diagnostics area.

- `ERRORS`

Whether an error occurred for the statement. The value is 0 if the SQLSTATE value begins with `00` (completion) or `01` (warning). The value is 1 if the SQLSTATE value is anything else.

- `WARNINGS`

The number of warnings, from the statement diagnostics area.

- `ROWS_AFFECTED`

The number of rows affected by the statement. For a description of the meaning of “affected,” see [mysql\\_affected\\_rows\(\)](#).

- `ROWS_SENT`

The number of rows returned by the statement.

- `ROWS_EXAMINED`

The number of rows examined by the server layer (not counting any processing internal to storage engines).

- `CREATED_TMP_DISK_TABLES`

Like the `Created_tmp_disk_tables` status variable, but specific to the statement.

- `CREATED_TMP_TABLES`

Like the `Created_tmp_tables` status variable, but specific to the statement.

- `SELECT_FULL_JOIN`

Like the `Select_full_join` status variable, but specific to the statement.

- `SELECT_FULL_RANGE_JOIN`

Like the `Select_full_range_join` status variable, but specific to the statement.

- `SELECT_RANGE`

Like the `Select_range` status variable, but specific to the statement.

- `SELECT_RANGE_CHECK`

Like the `Select_range_check` status variable, but specific to the statement.

- `SELECT_SCAN`

Like the `Select_scan` status variable, but specific to the statement.

- `SORT_MERGE_PASSES`

Like the `Sort_merge_passes` status variable, but specific to the statement.

- `SORT_RANGE`

Like the `Sort_range` status variable, but specific to the statement.

- `SORT_ROWS`

Like the `Sort_rows` status variable, but specific to the statement.

- `SORT_SCAN`

Like the `Sort_scan` status variable, but specific to the statement.

- `NO_INDEX_USED`

1 if the statement performed a table scan without using an index, 0 otherwise.

- `NO_GOOD_INDEX_USED`

1 if the server found no good index to use for the statement, 0 otherwise. For additional information, see the description of the `Extra` column from `EXPLAIN` output for the `Range checked for each record` value in [Section 10.8.2, “EXPLAIN Output Format”](#).

- `NESTING_EVENT_ID, NESTING_EVENT_TYPE, NESTING_EVENT_LEVEL`

These three columns are used with other columns to provide information as follows for top-level (unnested) statements and nested statements (executed within a stored program).

For top level statements:

```
OBJECT_TYPE = NULL
OBJECT_SCHEMA = NULL
OBJECT_NAME = NULL
NESTING_EVENT_ID = the parent transaction EVENT_ID
NESTING_EVENT_TYPE = 'TRANSACTION'
NESTING_LEVEL = 0
```

For nested statements:

```
OBJECT_TYPE = the parent statement object type
OBJECT_SCHEMA = the parent statement object schema
OBJECT_NAME = the parent statement object name
NESTING_EVENT_ID = the parent statement EVENT_ID
NESTING_EVENT_TYPE = 'STATEMENT'
NESTING_LEVEL = the parent statement NESTING_LEVEL plus one
```

- `STATEMENT_ID`

The query ID maintained by the server at the SQL level. The value is unique for the server instance because these IDs are generated using a global counter that is incremented atomically.

- [CPU\\_TIME](#)

The time spent on CPU for the current thread, expressed in picoseconds.

- [MAX\\_CONTROLLED\\_MEMORY](#)

Reports the maximum amount of controlled memory used by a statement during execution.

- [MAX\\_TOTAL\\_MEMORY](#)

Reports the maximum amount of memory used by a statement during execution.

- [EXECUTION\\_ENGINE](#)

The query execution engine. The value is either [PRIMARY](#) or [SECONDARY](#). For use with MySQL HeatWave Service and MySQL HeatWave, where the [PRIMARY](#) engine is [InnoDB](#) and the [SECONDARY](#) engine is MySQL HeatWave ([RAPID](#)). For MySQL Community Edition Server, MySQL Enterprise Edition Server (on-premise), and MySQL HeatWave Service without MySQL HeatWave, the value is always [PRIMARY](#).

The `events_statements_current` table has these indexes:

- Primary key on (`THREAD_ID`, `EVENT_ID`)

`TRUNCATE TABLE` is permitted for the `events_statements_current` table. It removes the rows.

### 29.12.6.2 The `events_statements_history` Table

The `events_statements_history` table contains the `N` most recent statement events that have ended per thread. Statement events are not added to the table until they have ended. When the table contains the maximum number of rows for a given thread, the oldest thread row is discarded when a new row for that thread is added. When a thread ends, all its rows are discarded.

The Performance Schema autosizes the value of `N` during server startup. To set the number of rows per thread explicitly, set the `performance_schema_events_statements_history_size` system variable at server startup.

The `events_statements_history` table has the same columns and indexing as `events_statements_current`. See [Section 29.12.6.1, “The `events\_statements\_current` Table”](#).

`TRUNCATE TABLE` is permitted for the `events_statements_history` table. It removes the rows.

For more information about the relationship between the three `events_statements_xxx` event tables, see [Section 29.9, “Performance Schema Tables for Current and Historical Events”](#).

For information about configuring whether to collect statement events, see [Section 29.12.6, “Performance Schema Statement Event Tables”](#).

### 29.12.6.3 The `events_statements_history_long` Table

The `events_statements_history_long` table contains the `N` most recent statement events that have ended globally, across all threads. Statement events are not added to the table until they have ended. When the table becomes full, the oldest row is discarded when a new row is added, regardless of which thread generated either row.

The value of `N` is autosized at server startup. To set the table size explicitly, set the `performance_schema_events_statements_history_long_size` system variable at server startup.

The `events_statements_history_long` table has the same columns as `events_statements_current`. See [Section 29.12.6.1, “The events\\_statements\\_current Table”](#). Unlike `events_statements_current`, `events_statements_history_long` has no indexing.

`TRUNCATE TABLE` is permitted for the `events_statements_history_long` table. It removes the rows.

For more information about the relationship between the three `events_statements_xxx` event tables, see [Section 29.9, “Performance Schema Tables for Current and Historical Events”](#).

For information about configuring whether to collect statement events, see [Section 29.12.6, “Performance Schema Statement Event Tables”](#).

#### 29.12.6.4 The prepared\_statements\_instances Table

The Performance Schema provides instrumentation for prepared statements, for which there are two protocols:

- The binary protocol. This is accessed through the MySQL C API and maps onto underlying server commands as shown in the following table.

C API Function	Corresponding Server Command
<code>mysql_stmt_prepare()</code>	<code>COM_STMT_PREPARE</code>
<code>mysql_stmt_execute()</code>	<code>COM_STMT_EXECUTE</code>
<code>mysql_stmt_close()</code>	<code>COM_STMT_CLOSE</code>

- The text protocol. This is accessed using SQL statements and maps onto underlying server commands as shown in the following table.

SQL Statement	Corresponding Server Command
<code>PREPARE</code>	<code>SQLCOM_PREPARE</code>
<code>EXECUTE</code>	<code>SQLCOM_EXECUTE</code>
<code>DEALLOCATE PREPARE, DROP PREPARE</code>	<code>SQLCOM DEALLOCATE PREPARE</code>

Performance Schema prepared statement instrumentation covers both protocols. The following discussion refers to the server commands rather than the C API functions or SQL statements.

Information about prepared statements is available in the `prepared_statements_instances` table. This table enables inspection of prepared statements used in the server and provides aggregated statistics about them. To control the size of this table, set the `performance_schema_max_prepared_statements_instances` system variable at server startup.

Collection of prepared statement information depends on the statement instruments shown in the following table. These instruments are enabled by default. To modify them, update the `setup_instruments` table.

Instrument	Server Command
<code>statement/com/Prepare</code>	<code>COM_STMT_PREPARE</code>
<code>statement/com/Execute</code>	<code>COM_STMT_EXECUTE</code>
<code>statement/sql/prepare_sql</code>	<code>SQLCOM_PREPARE</code>
<code>statement/sql/execute_sql</code>	<code>SQLCOM_EXECUTE</code>

The Performance Schema manages the contents of the `prepared_statements_instances` table as follows:

- Statement preparation

A `COM_STMT_PREPARE` or `SQLCOM_PREPARE` command creates a prepared statement in the server. If the statement is successfully instrumented, a new row is added to the `prepared_statements_instances` table. If the statement cannot be instrumented, `Performance_schema_prepared_statements_lost` status variable is incremented.

- Prepared statement execution

Execution of a `COM_STMT_EXECUTE` or `SQLCOM_PREPARE` command for an instrumented prepared statement instance updates the corresponding `prepared_statements_instances` table row.

- Prepared statement deallocation

Execution of a `COM_STMT_CLOSE` or `SQLCOM_DEALLOCATE_PREPARE` command for an instrumented prepared statement instance removes the corresponding `prepared_statements_instances` table row. To avoid resource leaks, removal occurs even if the prepared statement instruments described previously are disabled.

The `prepared_statements_instances` table has these columns:

- `OBJECT_INSTANCE_BEGIN`

The address in memory of the instrumented prepared statement.

- `STATEMENT_ID`

The internal statement ID assigned by the server. The text and binary protocols both use statement IDs.

- `STATEMENT_NAME`

For the binary protocol, this column is `NULL`. For the text protocol, this column is the external statement name assigned by the user. For example, for the following SQL statement, the name of the prepared statement is `stmt`:

```
PREPARE stmt FROM 'SELECT 1';
```

- `SQL_TEXT`

The prepared statement text, with `?` placeholder markers.

- `OWNER_THREAD_ID, OWNER_EVENT_ID`

These columns indicate the event that created the prepared statement.

- `OWNER_OBJECT_TYPE, OWNER_OBJECT_SCHEMA, OWNER_OBJECT_NAME`

For a prepared statement created by a client session, these columns are `NULL`. For a prepared statement created by a stored program, these columns point to the stored program. A typical user error is forgetting to deallocate prepared statements. These columns can be used to find stored programs that leak prepared statements:

```
SELECT
 OWNER_OBJECT_TYPE, OWNER_OBJECT_SCHEMA, OWNER_OBJECT_NAME,
 STATEMENT_NAME, SQL_TEXT
FROM performance_schema.prepared_statements_instances
WHERE OWNER_OBJECT_TYPE IS NOT NULL;
```

- The query execution engine. The value is either `PRIMARY` or `SECONDARY`. For use with MySQL HeatWave Service and MySQL HeatWave, where the `PRIMARY` engine is `InnoDB` and the `SECONDARY` engine is MySQL HeatWave (`RAPID`). For MySQL Community Edition Server, MySQL Enterprise Edition Server (on-premise), and MySQL HeatWave Service without MySQL HeatWave, the value is always `PRIMARY`.

- `TIMER_PREPARE`

The time spent executing the statement preparation itself.

- `COUNT_REPREPARE`

The number of times the statement was reprepared internally (see [Section 10.10.3, “Caching of Prepared Statements and Stored Programs”](#)). Timing statistics for repreparation are not available because it is counted as part of statement execution, not as a separate operation.

- `COUNT_EXECUTE, SUM_TIMER_EXECUTE, MIN_TIMER_EXECUTE, AVG_TIMER_EXECUTE, MAX_TIMER_EXECUTE`

Aggregated statistics for executions of the prepared statement.

- `SUM_xxx`

The remaining `SUM_xxx` columns are the same as for the statement summary tables (see [Section 29.12.20.3, “Statement Summary Tables”](#)).

- `MAX_CONTROLLED_MEMORY`

Reports the maximum amount of controlled memory used by a prepared statement during execution.

- `MAX_TOTAL_MEMORY`

Reports the maximum amount of memory used by a prepared statement during execution.

The `prepared_statements_instances` table has these indexes:

- Primary key on (`OBJECT_INSTANCE_BEGIN`)
- Index on (`STATEMENT_ID`)
- Index on (`STATEMENT_NAME`)
- Index on (`OWNER_THREAD_ID, OWNER_EVENT_ID`)
- Index on (`OWNER_OBJECT_TYPE, OWNER_OBJECT_SCHEMA, OWNER_OBJECT_NAME`)

`TRUNCATE TABLE` resets the statistics columns of the `prepared_statements_instances` table.

## 29.12.7 Performance Schema Transaction Tables

The Performance Schema instruments transactions. Within the event hierarchy, wait events nest within stage events, which nest within statement events, which nest within transaction events.

These tables store transaction events:

- `events_transactions_current`: The current transaction event for each thread.
- `events_transactions_history`: The most recent transaction events that have ended per thread.
- `events_transactions_history_long`: The most recent transaction events that have ended globally (across all threads).

The following sections describe the transaction event tables. There are also summary tables that aggregate information about transaction events; see [Section 29.12.20.5, “Transaction Summary Tables”](#).

For more information about the relationship between the three transaction event tables, see [Section 29.9, “Performance Schema Tables for Current and Historical Events”](#).

- Configuring Transaction Event Collection
- Transaction Boundaries
- Transaction Instrumentation
- Transactions and Nested Events
- Transactions and Stored Programs
- Transactions and Savepoints
- Transactions and Errors

## Configuring Transaction Event Collection

To control whether to collect transaction events, set the state of the relevant instruments and consumers:

- The `setup_instruments` table contains an instrument named `transaction`. Use this instrument to enable or disable collection of individual transaction event classes.
- The `setup_consumers` table contains consumer values with names corresponding to the current and historical transaction event table names. Use these consumers to filter collection of transaction events.

The `transaction` instrument and the `events_transactions_current` and `events_transactions_history` transaction consumers are enabled by default:

```
mysql> SELECT NAME, ENABLED, TIMED
 FROM performance_schema.setup_instruments
 WHERE NAME = 'transaction';
+-----+-----+-----+
| NAME | ENABLED | TIMED |
+-----+-----+-----+
| transaction | YES | YES |
+-----+-----+-----+
mysql> SELECT *
 FROM performance_schema.setup_consumers
 WHERE NAME LIKE 'events_transactions%';
+-----+-----+
| NAME | ENABLED |
+-----+-----+
| events_transactions_current | YES |
| events_transactions_history | YES |
| events_transactions_history_long | NO |
+-----+-----+
```

To control transaction event collection at server startup, use lines like these in your `my.cnf` file:

- Enable:

```
[mysqld]
performance-schema-instrument='transaction=ON'
performance-schema-consumer-events-transactions-current=ON
performance-schema-consumer-events-transactions-history=ON
performance-schema-consumer-events-transactions-history-long=ON
```

- Disable:

```
[mysqld]
performance-schema-instrument='transaction=OFF'
performance-schema-consumer-events-transactions-current=OFF
performance-schema-consumer-events-transactions-history=OFF
performance-schema-consumer-events-transactions-history-long=OFF
```

To control transaction event collection at runtime, update the `setup_instruments` and `setup_consumers` tables:

- Enable:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'YES', TIMED = 'YES'
WHERE NAME = 'transaction';

UPDATE performance_schema.setup_consumers
SET ENABLED = 'YES'
WHERE NAME LIKE 'events_transactions%';
```

- Disable:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'NO', TIMED = 'NO'
WHERE NAME = 'transaction';

UPDATE performance_schema.setup_consumers
SET ENABLED = 'NO'
WHERE NAME LIKE 'events_transactions%';
```

To collect transaction events only for specific transaction event tables, enable the [transaction](#) instrument but only the transaction consumers corresponding to the desired tables.

For additional information about configuring event collection, see [Section 29.3, “Performance Schema Startup Configuration”](#), and [Section 29.4, “Performance Schema Runtime Configuration”](#).

## Transaction Boundaries

In MySQL Server, transactions start explicitly with these statements:

```
START TRANSACTION | BEGIN | XA START | XA BEGIN
```

Transactions also start implicitly. For example, when the [autocommit](#) system variable is enabled, the start of each statement starts a new transaction.

When [autocommit](#) is disabled, the first statement following a committed transaction marks the start of a new transaction. Subsequent statements are part of the transaction until it is committed.

Transactions explicitly end with these statements:

```
COMMIT | ROLLBACK | XA COMMIT | XA ROLLBACK
```

Transactions also end implicitly, by execution of DDL statements, locking statements, and server administration statements.

In the following discussion, references to [START TRANSACTION](#) also apply to [BEGIN](#), [XA START](#), and [XA BEGIN](#). Similarly, references to [COMMIT](#) and [ROLLBACK](#) apply to [XA COMMIT](#) and [XA ROLLBACK](#), respectively.

The Performance Schema defines transaction boundaries similarly to that of the server. The start and end of a transaction event closely match the corresponding state transitions in the server:

- For an explicitly started transaction, the transaction event starts during processing of the [START TRANSACTION](#) statement.
- For an implicitly started transaction, the transaction event starts on the first statement that uses a transactional engine after the previous transaction has ended.
- For any transaction, whether explicitly or implicitly ended, the transaction event ends when the server transitions out of the active transaction state during the processing of [COMMIT](#) or [ROLLBACK](#).

There are subtle implications to this approach:

- Transaction events in the Performance Schema do not fully include the statement events associated with the corresponding [START TRANSACTION](#), [COMMIT](#), or [ROLLBACK](#) statements. There is a trivial amount of timing overlap between the transaction event and these statements.

- Statements that work with nontransactional engines have no effect on the transaction state of the connection. For implicit transactions, the transaction event begins with the first statement that uses a transactional engine. This means that statements operating exclusively on nontransactional tables are ignored, even following `START TRANSACTION`.

To illustrate, consider the following scenario:

```

1. SET autocommit = OFF;
2. CREATE TABLE t1 (a INT) ENGINE = InnoDB;
3. START TRANSACTION; -- Transaction 1 START
4. INSERT INTO t1 VALUES (1), (2), (3);
5. CREATE TABLE t2 (a INT) ENGINE = MyISAM; -- Transaction 1 COMMIT
 -- (implicit; DDL forces commit)
6. INSERT INTO t2 VALUES (1), (2), (3); -- Update nontransactional table
7. UPDATE t2 SET a = a + 1; -- ... and again
8. INSERT INTO t1 VALUES (4), (5), (6); -- Write to transactional table
 -- Transaction 2 START (implicit)
9. COMMIT; -- Transaction 2 COMMIT

```

From the perspective of the server, Transaction 1 ends when table `t2` is created. Transaction 2 does not start until a transactional table is accessed, despite the intervening updates to nontransactional tables.

From the perspective of the Performance Schema, Transaction 2 starts when the server transitions into an active transaction state. Statements 6 and 7 are not included within the boundaries of Transaction 2, which is consistent with how the server writes transactions to the binary log.

## Transaction Instrumentation

Three attributes define transactions:

- Access mode (read only, read write)
- Isolation level (`SERIALIZABLE`, `REPEATABLE READ`, and so forth)
- Implicit (`autocommit` enabled) or explicit (`autocommit` disabled)

To reduce complexity of the transaction instrumentation and to ensure that the collected transaction data provides complete, meaningful results, all transactions are instrumented independently of access mode, isolation level, or autocommit mode.

To selectively examine transaction history, use the attribute columns in the transaction event tables: `ACCESS_MODE`, `ISOLATION_LEVEL`, and `AUTOCOMMIT`.

The cost of transaction instrumentation can be reduced various ways, such as enabling or disabling transaction instrumentation according to user, account, host, or thread (client connection).

## Transactions and Nested Events

The parent of a transaction event is the event that initiated the transaction. For an explicitly started transaction, this includes the `START TRANSACTION` and `COMMIT AND CHAIN` statements. For an implicitly started transaction, it is the first statement that uses a transactional engine after the previous transaction ends.

In general, a transaction is the top-level parent to all events initiated during the transaction, including statements that explicitly end the transaction such as `COMMIT` and `ROLLBACK`. Exceptions are statements that implicitly end a transaction, such as DDL statements, in which case the current transaction must be committed before the new statement is executed.

## Transactions and Stored Programs

Transactions and stored program events are related as follows:

- Stored Procedures

Stored procedures operate independently of transactions. A stored procedure can be started within a transaction, and a transaction can be started or ended from within a stored procedure. If called from within a transaction, a stored procedure can execute statements that force a commit of the parent transaction and then start a new transaction.

If a stored procedure is started within a transaction, that transaction is the parent of the stored procedure event.

If a transaction is started by a stored procedure, the stored procedure is the parent of the transaction event.

- **Stored Functions**

Stored functions are restricted from causing an explicit or implicit commit or rollback. Stored function events can reside within a parent transaction event.

- **Triggers**

Triggers activate as part of a statement that accesses the table with which it is associated, so the parent of a trigger event is always the statement that activates it.

Triggers cannot issue statements that cause an explicit or implicit commit or rollback of a transaction.

- **Scheduled Events**

The execution of the statements in the body of a scheduled event takes place in a new connection. Nesting of a scheduled event within a parent transaction is not applicable.

## Transactions and Savepoints

Savepoint statements are recorded as separate statement events. Transaction events include separate counters for `SAVEPOINT`, `ROLLBACK TO SAVEPOINT`, and `RELEASE SAVEPOINT` statements issued during the transaction.

## Transactions and Errors

Errors and warnings that occur within a transaction are recorded in statement events, but not in the corresponding transaction event. This includes transaction-specific errors and warnings, such as a rollback on a nontransactional table or GTID consistency errors.

### 29.12.7.1 The `events_transactions_current` Table

The `events_transactions_current` table contains current transaction events. The table stores one row per thread showing the current status of the thread's most recent monitored transaction event, so there is no system variable for configuring the table size. For example:

```
mysql> SELECT *
 FROM performance_schema.events_transactions_current LIMIT 1\G

 1. row ****
 THREAD_ID: 26
 EVENT_ID: 7
 END_EVENT_ID: NULL
 EVENT_NAME: transaction
 STATE: ACTIVE
 TRX_ID: NULL
 GTID: 3E11FA47-71CA-11E1-9E33-C80AA9429562:56
 XID: NULL
 XA_STATE: NULL
 SOURCE: transaction.cc:150
 TIMER_START: 420833537900000
 TIMER_END: NULL
 TIMER_WAIT: NULL
 ACCESS_MODE: READ WRITE
 ISOLATION_LEVEL: REPEATABLE READ
```

```

AUTOCOMMIT: NO
NUMBER_OF_SAVEPOINTS: 0
NUMBER_OF_ROLLBACK_TO_SAVEPOINT: 0
NUMBER_OF_RELEASE_SAVEPOINT: 0
OBJECT_INSTANCE_BEGIN: NULL
NESTING_EVENT_ID: 6
NESTING_EVENT_TYPE: STATEMENT

```

Of the tables that contain transaction event rows, `events_transactions_current` is the most fundamental. Other tables that contain transaction event rows are logically derived from the current events. For example, the `events_transactions_history` and `events_transactions_history_long` tables are collections of the most recent transaction events that have ended, up to a maximum number of rows per thread and globally across all threads, respectively.

For more information about the relationship between the three transaction event tables, see [Section 29.9, “Performance Schema Tables for Current and Historical Events”](#).

For information about configuring whether to collect transaction events, see [Section 29.12.7, “Performance Schema Transaction Tables”](#).

The `events_transactions_current` table has these columns:

- `THREAD_ID`, `EVENT_ID`

The thread associated with the event and the thread current event number when the event starts. The `THREAD_ID` and `EVENT_ID` values taken together uniquely identify the row. No two rows have the same pair of values.

- `END_EVENT_ID`

This column is set to `NULL` when the event starts and updated to the thread current event number when the event ends.

- `EVENT_NAME`

The name of the instrument from which the event was collected. This is a `NAME` value from the `setup_instruments` table. Instrument names may have multiple parts and form a hierarchy, as discussed in [Section 29.6, “Performance Schema Instrument Naming Conventions”](#).

- `STATE`

The current transaction state. The value is `ACTIVE` (after `START TRANSACTION` or `BEGIN`), `COMMITTED` (after `COMMIT`), or `ROLLED BACK` (after `ROLLBACK`).

- `TRX_ID`

Unused.

- `GTID`

The GTID column contains the value of `gtid_next`, which can be one of `ANONYMOUS`, `AUTOMATIC`, or a GTID using the format `UUID:NUMBER`. For transactions that use `gtid_next=AUTOMATIC`, which is all normal client transactions, the GTID column changes when the transaction commits and the actual GTID is assigned. If `gtid_mode` is either `ON` or `ON_PERMISSIVE`, the GTID column changes to the transaction's GTID. If `gtid_mode` is either `OFF` or `OFF_PERMISSIVE`, the GTID column changes to `ANONYMOUS`.

- `XID_FORMAT_ID`, `XID_GTRID`, and `XID_BQUAL`

The elements of the XA transaction identifier. They have the format described in [Section 15.3.8.1, “XA Transaction SQL Statements”](#).

- `XA_STATE`

The state of the XA transaction. The value is `ACTIVE` (after `XA START`), `IDLE` (after `XA END`), `PREPARED` (after `XA PREPARE`), `ROLLED BACK` (after `XA ROLLBACK`), or `COMMITTED` (after `XA COMMIT`).

On a replica, the same XA transaction can appear in the `events_transactions_current` table with different states on different threads. This is because immediately after the XA transaction is prepared, it is detached from the replica's applier thread, and can be committed or rolled back by any thread on the replica. The `events_transactions_current` table displays the current status of the most recent monitored transaction event on the thread, and does not update this status when the thread is idle. So the XA transaction can still be displayed in the `PREPARED` state for the original applier thread, after it has been processed by another thread. To positively identify XA transactions that are still in the `PREPARED` state and need to be recovered, use the `XA RECOVER` statement rather than the Performance Schema transaction tables.

- `SOURCE`

The name of the source file containing the instrumented code that produced the event and the line number in the file at which the instrumentation occurs. This enables you to check the source to determine exactly what code is involved.

- `TIMER_START`, `TIMER_END`, `TIMER_WAIT`

Timing information for the event. The unit for these values is picoseconds (trillions of a second). The `TIMER_START` and `TIMER_END` values indicate when event timing started and ended. `TIMER_WAIT` is the event elapsed time (duration).

If an event has not finished, `TIMER_END` is the current timer value and `TIMER_WAIT` is the time elapsed so far (`TIMER_END - TIMER_START`).

If an event is produced from an instrument that has `TIMED = NO`, timing information is not collected, and `TIMER_START`, `TIMER_END`, and `TIMER_WAIT` are all `NULL`.

For discussion of picoseconds as the unit for event times and factors that affect time values, see [Section 29.4.1, “Performance Schema Event Timing”](#).

- `ACCESS_MODE`

The transaction access mode. The value is `READ WRITE` or `READ ONLY`.

- `ISOLATION_LEVEL`

The transaction isolation level. The value is `REPEATABLE READ`, `READ COMMITTED`, `READ UNCOMMITTED`, or `SERIALIZABLE`.

- `AUTOCOMMIT`

Whether autocommit mode was enabled when the transaction started.

- `NUMBER_OF_SAVEPOINTS`, `NUMBER_OF_ROLLBACK_TO_SAVEPOINT`,  
`NUMBER_OF_RELEASE_SAVEPOINT`

The number of `SAVEPOINT`, `ROLLBACK TO SAVEPOINT`, and `RELEASE SAVEPOINT` statements issued during the transaction.

- `OBJECT_INSTANCE_BEGIN`

Unused.

- `NESTING_EVENT_ID`

The `EVENT_ID` value of the event within which this event is nested.

- `NESTING_EVENT_TYPE`

The nesting event type. The value is `TRANSACTION`, `STATEMENT`, `STAGE`, or `WAIT`. (`TRANSACTION` does not appear because transactions cannot be nested.)

The `events_transactions_current` table has these indexes:

- Primary key on `(THREAD_ID, EVENT_ID)`

`TRUNCATE TABLE` is permitted for the `events_transactions_current` table. It removes the rows.

### 29.12.7.2 The `events_transactions_history` Table

The `events_transactions_history` table contains the `N` most recent transaction events that have ended per thread. Transaction events are not added to the table until they have ended. When the table contains the maximum number of rows for a given thread, the oldest thread row is discarded when a new row for that thread is added. When a thread ends, all its rows are discarded.

The Performance Schema autosizes the value of `N` during server startup. To set the number of rows per thread explicitly, set the `performance_schema_events_transactions_history_size` system variable at server startup.

The `events_transactions_history` table has the same columns and indexing as `events_transactions_current`. See [Section 29.12.7.1, “The `events\_transactions\_current` Table”](#).

`TRUNCATE TABLE` is permitted for the `events_transactions_history` table. It removes the rows.

For more information about the relationship between the three transaction event tables, see [Section 29.9, “Performance Schema Tables for Current and Historical Events”](#).

For information about configuring whether to collect transaction events, see [Section 29.12.7, “Performance Schema Transaction Tables”](#).

### 29.12.7.3 The `events_transactions_history_long` Table

The `events_transactions_history_long` table contains the `N` most recent transaction events that have ended globally, across all threads. Transaction events are not added to the table until they have ended. When the table becomes full, the oldest row is discarded when a new row is added, regardless of which thread generated either row.

The Performance Schema autosizes the value of `N` is autosized at server startup. To set the table size explicitly, set the `performance_schema_events_transactions_history_long_size` system variable at server startup.

The `events_transactions_history_long` table has the same columns as `events_transactions_current`. See [Section 29.12.7.1, “The `events\_transactions\_current` Table”](#). Unlike `events_transactions_current`, `events_transactions_history_long` has no indexing.

`TRUNCATE TABLE` is permitted for the `events_transactions_history_long` table. It removes the rows.

For more information about the relationship between the three transaction event tables, see [Section 29.9, “Performance Schema Tables for Current and Historical Events”](#).

For information about configuring whether to collect transaction events, see [Section 29.12.7, “Performance Schema Transaction Tables”](#).

## 29.12.8 Performance Schema Connection Tables

When a client connects to the MySQL server, it does so under a particular user name and from a particular host. The Performance Schema provides statistics about these connections, tracking them

per account (user and host combination) as well as separately per user name and host name, using these tables:

- `accounts`: Connection statistics per client account
- `hosts`: Connection statistics per client host name
- `users`: Connection statistics per client user name

The meaning of “account” in the connection tables is similar to its meaning in the MySQL grant tables in the `mysql` system database, in the sense that the term refers to a combination of user and host values. They differ in that, for grant tables, the host part of an account can be a pattern, whereas for Performance Schema tables, the host value is always a specific nonpattern host name.

Each connection table has `CURRENT_CONNECTIONS` and `TOTAL_CONNECTIONS` columns to track the current and total number of connections per “tracking value” on which its statistics are based. The tables differ in what they use for the tracking value. The `accounts` table has `USER` and `HOST` columns to track connections per user and host combination. The `users` and `hosts` tables have a `USER` and `HOST` column, respectively, to track connections per user name and host name.

The Performance Schema also counts internal threads and threads for user sessions that failed to authenticate, using rows with `USER` and `HOST` column values of `NULL`.

Suppose that clients named `user1` and `user2` each connect one time from `hosta` and `hostb`. The Performance Schema tracks the connections as follows:

- The `accounts` table has four rows, for the `user1/hosta`, `user1/hostb`, `user2/hosta`, and `user2/hostb` account values, each row counting one connection per account.
- The `hosts` table has two rows, for `hosta` and `hostb`, each row counting two connections per host name.
- The `users` table has two rows, for `user1` and `user2`, each row counting two connections per user name.

When a client connects, the Performance Schema determines which row in each connection table applies, using the tracking value appropriate to each table. If there is no such row, one is added. Then the Performance Schema increments by one the `CURRENT_CONNECTIONS` and `TOTAL_CONNECTIONS` columns in that row.

When a client disconnects, the Performance Schema decrements by one the `CURRENT_CONNECTIONS` column in the row and leaves the `TOTAL_CONNECTIONS` column unchanged.

`TRUNCATE TABLE` is permitted for connection tables. It has these effects:

- Rows are removed for accounts, hosts, or users that have no current connections (rows with `CURRENT_CONNECTIONS = 0`).
- Nonremoved rows are reset to count only current connections: For rows with `CURRENT_CONNECTIONS > 0`, `TOTAL_CONNECTIONS` is reset to `CURRENT_CONNECTIONS`.
- Summary tables that depend on the connection table are implicitly truncated, as described later in this section.

The Performance Schema maintains summary tables that aggregate connection statistics for various event types by account, host, or user. These tables have `_summary_by_account`, `_summary_by_host`, or `_summary_by_user` in the name. To identify them, use this query:

```
mysql> SELECT TABLE_NAME FROM INFORMATION_SCHEMA.TABLES
 WHERE TABLE_SCHEMA = 'performance_schema'
 AND TABLE_NAME REGEXP '_summary_by_(account|host|user)'
 ORDER BY TABLE_NAME;
```

TABLE_NAME
events_errors_summary_by_account_by_error
events_errors_summary_by_host_by_error
events_errors_summary_by_user_by_error
events_stages_summary_by_account_by_event_name
events_stages_summary_by_host_by_event_name
events_stages_summary_by_user_by_event_name
events_statements_summary_by_account_by_event_name
events_statements_summary_by_host_by_event_name
events_statements_summary_by_user_by_event_name
events_transactions_summary_by_account_by_event_name
events_transactions_summary_by_host_by_event_name
events_transactions_summary_by_user_by_event_name
events_waits_summary_by_account_by_event_name
events_waits_summary_by_host_by_event_name
events_waits_summary_by_user_by_event_name
memory_summary_by_account_by_event_name
memory_summary_by_host_by_event_name
memory_summary_by_user_by_event_name

For details about individual connection summary tables, consult the section that describes tables for the summarized event type:

- Wait event summaries: [Section 29.12.20.1, “Wait Event Summary Tables”](#)
- Stage event summaries: [Section 29.12.20.2, “Stage Summary Tables”](#)
- Statement event summaries: [Section 29.12.20.3, “Statement Summary Tables”](#)
- Transaction event summaries: [Section 29.12.20.5, “Transaction Summary Tables”](#)
- Memory event summaries: [Section 29.12.20.10, “Memory Summary Tables”](#)
- Error event summaries: [Section 29.12.20.11, “Error Summary Tables”](#)

`TRUNCATE TABLE` is permitted for connection summary tables. It removes rows for accounts, hosts, or users with no connections, and resets the summary columns to zero for the remaining rows. In addition, each summary table that is aggregated by account, host, user, or thread is implicitly truncated by truncation of the connection table on which it depends. The following table describes the relationship between connection table truncation and implicitly truncated tables.

**Table 29.2 Implicit Effects of Connection Table Truncation**

Truncated Connection Table	Implicitly Truncated Summary Tables
<code>accounts</code>	Tables with names containing <code>_summary_by_account</code> , <code>_summary_by_thread</code>
<code>hosts</code>	Tables with names containing <code>_summary_by_account</code> , <code>_summary_by_host</code> , <code>_summary_by_thread</code>
<code>users</code>	Tables with names containing <code>_summary_by_account</code> , <code>_summary_by_user</code> , <code>_summary_by_thread</code>

Truncating a `_summary_global` summary table also implicitly truncates its corresponding connection and thread summary tables. For example, truncating `events_waits_summary_global_by_event_name` implicitly truncates the wait event summary tables that are aggregated by account, host, user, or thread.

### 29.12.8.1 The accounts Table

The `accounts` table contains a row for each account that has connected to the MySQL server. For each account, the table counts the current and total number of connections. The table size is autosized at server startup. To set the table size explicitly, set the `performance_schema_accounts_size` system variable at server startup. To disable account statistics, set this variable to 0.

The `accounts` table has the following columns. For a description of how the Performance Schema maintains rows in this table, including the effect of `TRUNCATE TABLE`, see [Section 29.12.8, “Performance Schema Connection Tables”](#).

- `USER`

The client user name for the connection. This is `NULL` for an internal thread, or for a user session that failed to authenticate.

- `HOST`

The host from which the client connected. This is `NULL` for an internal thread, or for a user session that failed to authenticate.

- `CURRENT_CONNECTIONS`

The current number of connections for the account.

- `TOTAL_CONNECTIONS`

The total number of connections for the account.

- `MAX_SESSION_CONTROLLED_MEMORY`

Reports the maximum amount of controlled memory used by a session belonging to the account.

- `MAX_SESSION_TOTAL_MEMORY`

Reports the maximum amount of memory used by a session belonging to the account.

The `accounts` table has these indexes:

- Primary key on (`USER`, `HOST`)

## 29.12.8.2 The hosts Table

The `hosts` table contains a row for each host from which clients have connected to the MySQL server. For each host name, the table counts the current and total number of connections. The table size is autosized at server startup. To set the table size explicitly, set the `performance_schema_hosts_size` system variable at server startup. To disable host statistics, set this variable to 0.

The `hosts` table has the following columns. For a description of how the Performance Schema maintains rows in this table, including the effect of `TRUNCATE TABLE`, see [Section 29.12.8, “Performance Schema Connection Tables”](#).

- `HOST`

The host from which the client connected. This is `NULL` for an internal thread, or for a user session that failed to authenticate.

- `CURRENT_CONNECTIONS`

The current number of connections for the host.

- `TOTAL_CONNECTIONS`

The total number of connections for the host.

- [MAX\\_SESSION\\_CONTROLLED\\_MEMORY](#)

Reports the maximum amount of controlled memory used by a session belonging to the host.

- [MAX\\_SESSION\\_TOTAL\\_MEMORY](#)

Reports the maximum amount of memory used by a session belonging to the host.

The [hosts](#) table has these indexes:

- Primary key on ([HOST](#))

### 29.12.8.3 The users Table

The [users](#) table contains a row for each user who has connected to the MySQL server. For each user name, the table counts the current and total number of connections. The table size is autosized at server startup. To set the table size explicitly, set the [performance\\_schema\\_users\\_size](#) system variable at server startup. To disable user statistics, set this variable to 0.

The [users](#) table has the following columns. For a description of how the Performance Schema maintains rows in this table, including the effect of [TRUNCATE TABLE](#), see [Section 29.12.8, “Performance Schema Connection Tables”](#).

- [USER](#)

The client user name for the connection. This is [NULL](#) for an internal thread, or for a user session that failed to authenticate.

- [CURRENT\\_CONNECTIONS](#)

The current number of connections for the user.

- [TOTAL\\_CONNECTIONS](#)

The total number of connections for the user.

- [MAX\\_SESSION\\_CONTROLLED\\_MEMORY](#)

Reports the maximum amount of controlled memory used by a session belonging to the user.

- [MAX\\_SESSION\\_TOTAL\\_MEMORY](#)

Reports the maximum amount of memory used by a session belonging to the user.

The [users](#) table has these indexes:

- Primary key on ([USER](#))

### 29.12.9 Performance Schema Connection Attribute Tables

Connection attributes are key-value pairs that application programs can pass to the server at connect time. For applications based on the C API implemented by the [libmysqlclient](#) client library, the [mysql\\_options\(\)](#) and [mysql\\_options4\(\)](#) functions define the connection attribute set. Other MySQL Connectors may provide their own attribute-definition methods.

These Performance Schema tables expose attribute information:

- [session\\_account\\_connect\\_attrs](#): Connection attributes for the current session, and other sessions associated with the session account

- `session_connect_attrs`: Connection attributes for all sessions

In addition, connect events written to the audit log may include connection attributes. See [Section 8.4.5.4, “Audit Log File Formats”](#).

Attribute names that begin with an underscore (`_`) are reserved for internal use and should not be created by application programs. This convention permits new attributes to be introduced by MySQL without colliding with application attributes, and enables application programs to define their own attributes that do not collide with internal attributes.

- [Available Connection Attributes](#)
- [Connection Attribute Limits](#)

## Available Connection Attributes

The set of connection attributes visible within a given connection varies depending on factors such as your platform, MySQL Connector used to establish the connection, or client program.

The `libmysqlclient` client library sets these attributes:

- `_client_name`: The client name (`libmysql` for the client library).
- `_client_version`: The client library version.
- `_os`: The operating system (for example, `Linux`, `Win64`).
- `_pid`: The client process ID.
- `_platform`: The machine platform (for example, `x86_64`).
- `_thread`: The client thread ID (Windows only).

Other MySQL Connectors may define their own connection attributes.

MySQL Connector/C++ defines these attributes for applications that use X DevAPI or X DevAPI for C:

- `_client_license`: The connector license (for example `GPL-2.0`).
- `_client_name`: The connector name (`mysql-connector-cpp`).
- `_client_version`: The connector version.
- `_os`: The operating system (for example, `Linux`, `Win64`).
- `_pid`: The client process ID.
- `_platform`: The machine platform (for example, `x86_64`).
- `_source_host`: The host name of the machine on which the client is running.
- `_thread`: The client thread ID (Windows only).

MySQL Connector/J defines these attributes:

- `_client_name`: The client name
- `_client_version`: The client library version
- `_os`: The operating system (for example, `Linux`, `Win64`)
- `_client_license`: The connector license type
- `_platform`: The machine platform (for example, `x86_64`)

- `_runtime_vendor`: The Java runtime environment (JRE) vendor
- `_runtime_version`: The Java runtime environment (JRE) version

MySQL Connector/.NET defines these attributes:

- `_client_version`: The client library version.
- `_os`: The operating system (for example, `Linux`, `Win64`).
- `_pid`: The client process ID.
- `_platform`: The machine platform (for example, `x86_64`).
- `_program_name`: The client name.
- `_thread`: The client thread ID (Windows only).

The Connector/Python implementation defines these attributes; some values and attributes depend on the Connector/Python implementation (pure python or c-ext):

- `_client_license`: The license type of the connector; `GPL-2.0` or `Commercial`. (pure python only)
- `_client_name`: Set to `mysql-connector-python` (pure python) or `libmysql` (c-ext)
- `_client_version`: The connector version (pure python) or mysqlclient library version (c-ext).
- `_os`: The operating system with the connector (for example, `Linux`, `Win64`).
- `_pid`: The process identifier on the source machine (for example, `26955`)
- `_platform`: The machine platform (for example, `x86_64`).
- `_source_host`: The host name of the machine on which the connector is connecting from.
- `_connector_version`: The connector version (for example, `8.4.6`) (c-ext only).
- `_connector_license`: The license type of the connector; `GPL-2.0` or `Commercial` (c-ext only).
- `_connector_name`: Always set to `mysql-connector-python` (c-ext only).

PHP defines attributes that depend on how it was compiled:

- Compiled using `libmysqlclient`: The standard `libmysqlclient` attributes, described previously.
- Compiled using `mysqlnd`: Only the `_client_name` attribute, with a value of `mysqlnd`.

Many MySQL client programs set a `program_name` attribute with a value equal to the client name. For example, `mysqladmin` and `mysqldump` set `program_name` to `mysqladmin` and `mysqldump`, respectively. MySQL Shell sets `program_name` to `mysqlsh`.

Some MySQL client programs define additional attributes:

- `mysql`:
  - `os_user`: The name of the operating system user running the program. Available on Unix and Unix-like systems and Windows.
  - `os_sudouser`: The value of the `SUDO_USER` environment variable. Available on Unix and Unix-like systems.

`mysql` connection attributes for which the value is empty are not sent.

- `mysqlbinlog`:
  - `_client_role:binary_log_listener`
- Replica connections:
  - `program_name:mysqld`
  - `_client_role:binary_log_listener`
  - `_client_replication_channel_name`: The channel name.
- `FEDERATED` storage engine connections:
  - `program_name:mysqld`
  - `_client_role:federated_storage`

## Connection Attribute Limits

There are limits on the amount of connection attribute data transmitted from client to server:

- A fixed limit imposed by the client prior to connect time.
- A fixed limit imposed by the server at connect time.
- A configurable limit imposed by the Performance Schema at connect time.

For connections initiated using the C API, the `libmysqlclient` library imposes a limit of 64KB on the aggregate size of connection attribute data on the client side: Calls to `mysql_options()` that cause this limit to be exceeded produce a `CR_INVALID_PARAMETER_NO` error. Other MySQL Connectors may impose their own client-side limits on how much connection attribute data can be transmitted to the server.

On the server side, these size checks on connection attribute data occur:

- The server imposes a limit of 64KB on the aggregate size of connection attribute data it accepts. If a client attempts to send more than 64KB of attribute data, the server rejects the connection. Otherwise, the server considers the attribute buffer valid and tracks the size of the longest such buffer in the `Performance_schema_session_connect_attrs_longest_seen` status variable.
- For accepted connections, the Performance Schema checks aggregate attribute size against the value of the `performance_schema_session_connect_attrs_size` system variable. If attribute size exceeds this value, these actions take place:
  - The Performance Schema truncates the attribute data and increments the `Performance_schema_session_connect_attrs_lost` status variable, which indicates the number of connections for which attribute truncation occurred.
  - The Performance Schema writes a message to the error log if the `log_error_verbosity` system variable is greater than 1:

```
Connection attributes of length N were truncated
(N bytes lost)
for connection N, user user_name@host_name
(as user_name), auth: {yes|no}
```

The information in the warning message is intended to help DBAs identify clients for which attribute truncation occurred.

- A `_truncated` attribute is added to the session attributes with a value indicating how many bytes were lost, if the attribute buffer has sufficient space. This enables the Performance Schema to

expose per-connection truncation information in the connection attribute tables. This information can be examined without having to check the error log.

### 29.12.9.1 The session\_account\_connect\_attrs Table

Application programs can provide key-value connection attributes to be passed to the server at connect time. For descriptions of common attributes, see [Section 29.12.9, “Performance Schema Connection Attribute Tables”](#).

The `session_account_connect_attrs` table contains connection attributes only for the current session, and other sessions associated with the session account. To see connection attributes for all sessions, use the `session_connect_attrs` table.

The `session_account_connect_attrs` table has these columns:

- `PROCESSLIST_ID`

The connection identifier for the session.

- `ATTR_NAME`

The attribute name.

- `ATTR_VALUE`

The attribute value.

- `ORDINAL_POSITION`

The order in which the attribute was added to the set of connection attributes.

The `session_account_connect_attrs` table has these indexes:

- Primary key on (`PROCESSLIST_ID`, `ATTR_NAME`)

`TRUNCATE TABLE` is not permitted for the `session_account_connect_attrs` table.

### 29.12.9.2 The session\_connect\_attrs Table

Application programs can provide key-value connection attributes to be passed to the server at connect time. For descriptions of common attributes, see [Section 29.12.9, “Performance Schema Connection Attribute Tables”](#).

The `session_connect_attrs` table contains connection attributes for all sessions. To see connection attributes only for the current session, and other sessions associated with the session account, use the `session_account_connect_attrs` table.

The `session_connect_attrs` table has these columns:

- `PROCESSLIST_ID`

The connection identifier for the session.

- `ATTR_NAME`

The attribute name.

- `ATTR_VALUE`

The attribute value.

- `ORDINAL_POSITION`

The order in which the attribute was added to the set of connection attributes.

The `session_connect_attrs` table has these indexes:

- Primary key on (`PROCESSLIST_ID`, `ATTR_NAME`)

`TRUNCATE TABLE` is not permitted for the `session_connect_attrs` table.

## 29.12.10 Performance Schema User-Defined Variable Tables

The Performance Schema provides a `user_variables_by_thread` table that exposes user-defined variables. These are variables defined within a specific session and include a @ character preceding the name; see [Section 11.4, “User-Defined Variables”](#).

The `user_variables_by_thread` table has these columns:

- `THREAD_ID`

The thread identifier of the session in which the variable is defined.

- `VARIABLE_NAME`

The variable name, without the leading @ character.

- `VARIABLE_VALUE`

The variable value.

The `user_variables_by_thread` table has these indexes:

- Primary key on (`THREAD_ID`, `VARIABLE_NAME`)

`TRUNCATE TABLE` is not permitted for the `user_variables_by_thread` table.

## 29.12.11 Performance Schema Replication Tables

The Performance Schema provides tables that expose replication information. This is similar to the information available from the `SHOW REPLICAS STATUS` statement, but representation in table form is more accessible and has usability benefits:

- `SHOW REPLICAS STATUS` output is useful for visual inspection, but not so much for programmatic use. By contrast, using the Performance Schema tables, information about replica status can be searched using general `SELECT` queries, including complex `WHERE` conditions, joins, and so forth.
- Query results can be saved in tables for further analysis, or assigned to variables and thus used in stored procedures.
- The replication tables provide better diagnostic information. For multithreaded replica operation, `SHOW REPLICAS STATUS` reports all coordinator and worker thread errors using the `Last_SQL_Errno` and `Last_SQL_Error` fields, so only the most recent of those errors is visible and information can be lost. The replication tables store errors on a per-thread basis without loss of information.
- The last seen transaction is visible in the replication tables on a per-worker basis. This is information not available from `SHOW REPLICAS STATUS`.
- Developers familiar with the Performance Schema interface can extend the replication tables to provide additional information by adding rows to the tables.

### Replication Table Descriptions

The Performance Schema provides the following replication-related tables:

- Tables that contain information about the connection of the replica to the source:
  - `replication_connection_configuration`: Configuration parameters for connecting to the source
  - `replication_connection_status`: Current status of the connection to the source
  - `replication_asynchronous_connection_failover`: Source lists for the asynchronous connection failover mechanism
- Tables that contain general (not thread-specific) information about the transaction applier:
  - `replication_applier_configuration`: Configuration parameters for the transaction applier on the replica.
  - `replication_applier_status`: Current status of the transaction applier on the replica.
- Tables that contain information about specific threads responsible for applying transactions received from the source:
  - `replication_applier_status_by_coordinator`: Status of the coordinator thread (empty unless the replica is multithreaded).
  - `replication_applier_status_by_worker`: Status of the applier thread or worker threads if the replica is multithreaded.
- Tables that contain information about channel based replication filters:
  - `replication_applier_filters`: Provides information about the replication filters configured on specific replication channels.
  - `replication_applier_global_filters`: Provides information about global replication filters, which apply to all replication channels.
- Tables that contain information about Group Replication members:
  - `replication_group_members`: Provides network and status information for group members.
  - `replication_group_member_stats`: Provides statistical information about group members and transactions in which they participate.

For more information see [Section 20.4, “Monitoring Group Replication”](#).

The following Performance Schema replication tables continue to be populated when the Performance Schema is disabled:

- `replication_connection_configuration`
- `replication_connection_status`
- `replication_asynchronous_connection_failover`
- `replication_applier_configuration`
- `replication_applier_status`
- `replication_applier_status_by_coordinator`
- `replication_applier_status_by_worker`

The exception is local timing information (start and end timestamps for transactions) in the replication tables `replication_connection_status`, `replication_applier_status_by_coordinator`, and

`replication_applier_status_by_worker`. This information is not collected when the Performance Schema is disabled.

The following sections describe each replication table in more detail, including the correspondence between the columns produced by `SHOW REPLICAS STATUS` and the replication table columns in which the same information appears.

The remainder of this introduction to the replication tables describes how the Performance Schema populates them and which fields from `SHOW REPLICAS STATUS` are not represented in the tables.

## Replication Table Life Cycle

The Performance Schema populates the replication tables as follows:

- Prior to execution of `CHANGE REPLICATION SOURCE TO`, the tables are empty.
- After `CHANGE REPLICATION SOURCE TO`, the configuration parameters can be seen in the tables. At this time, there are no active replication threads, so the `THREAD_ID` columns are `NULL` and the `SERVICE_STATE` columns have a value of `OFF`.
- After `START REPLICA`, non-null `THREAD_ID` values can be seen. Threads that are idle or active have a `SERVICE_STATE` value of `ON`. The thread that connects to the source has a value of `CONNECTING` while it establishes the connection, and `ON` thereafter as long as the connection lasts.
- After `STOP REPLICA`, the `THREAD_ID` columns become `NULL` and the `SERVICE_STATE` columns for threads that no longer exist have a value of `OFF`.
- The tables are preserved after `STOP REPLICA` or threads stopping due to an error.
- The `replication_applier_status_by_worker` table is nonempty only when the replica is operating in multithreaded mode. That is, if the `replica_parallel_workers` system variable is greater than 0, this table is populated when `START REPLICA` is executed, and the number of rows shows the number of workers.

## Replica Status Information Not In the Replication Tables

The information in the Performance Schema replication tables differs somewhat from the information available from `SHOW REPLICAS STATUS` because the tables are oriented toward use of global transaction identifiers (GTIDs), not file names and positions, and they represent server UUID values, not server ID values. Due to these differences, several `SHOW REPLICAS STATUS` columns are not preserved in the Performance Schema replication tables, or are represented a different way:

- The following fields refer to file names and positions and are not preserved:

```
Master_Log_File
Read_Master_Log_Pos
Relay_Log_File
Relay_Log_Pos
Relay_Master_Log_File
Exec_Master_Log_Pos
Until_Condition
Until_Log_File
Until_Log_Pos
```

- The `Master_Info_File` field is not preserved. It refers to the `master.info` file used for the replica's source metadata repository, which has been superseded by the use of crash-safe tables for the repository.
- The following fields are based on `server_id`, not `server_uuid`, and are not preserved:

```
Master_Server_Id
Replicate_Ignore_Server_Ids
```

- The `Skip_Counter` field is based on event counts, not GTIDs, and is not preserved.
- These error fields are aliases for `Last_SQL_Errno` and `Last_SQL_Error`, so they are not preserved:

```
Last_Errno
Last_Error
```

In the Performance Schema, this error information is available in the `LAST_ERROR_NUMBER` and `LAST_ERROR_MESSAGE` columns of the `replication_applier_status_by_worker` table (and `replication_applier_status_by_coordinator` if the replica is multithreaded). Those tables provide more specific per-thread error information than is available from `Last_Errno` and `Last_Error`.

- Fields that provide information about command-line filtering options is not preserved:

```
Replicate_Do_DB
Replicate_Ignore_DB
Replicate_Do_Table
Replicate_Ignore_Table
Replicate_Wild_Do_Table
Replicate_Wild_Ignore_Table
```

- The `Replica_IO_State` and `Replica_SQL_Running_State` fields are not preserved. If needed, these values can be obtained from the process list by using the `THREAD_ID` column of the appropriate replication table and joining it with the `ID` column in the `INFORMATION_SCHEMA PROCESSLIST` table to select the `STATE` column of the latter table.
- The `Executed_Gtid_Set` field can show a large set with a great deal of text. Instead, the Performance Schema tables show GTIDs of transactions that are currently being applied by the replica. Alternatively, the set of executed GTIDs can be obtained from the value of the `gtid_executed` system variable.
- The `Seconds_Behind_Master` and `Relay_Log_Space` fields are in to-be-decided status and are not preserved.

## Replication Channels

The first column of the replication Performance Schema tables is `CHANNEL_NAME`. This enables the tables to be viewed per replication channel. In a non-multisource replication setup there is a single default replication channel. When you are using multiple replication channels on a replica, you can filter the tables per replication channel to monitor a specific replication channel. See [Section 19.2.2, “Replication Channels”](#) and [Section 19.1.5.8, “Monitoring Multi-Source Replication”](#) for more information.

### 29.12.11.1 The `binary_log_transaction_compression_stats` Table

This table shows statistical information for transaction payloads written to the binary log and relay log, and can be used to calculate the effects of enabling binary log transaction compression. For information on binary log transaction compression, see [Section 7.4.4.5, “Binary Log Transaction Compression”](#).

The `binary_log_transaction_compression_stats` table is populated only when the server instance has a binary log, and the system variable `binlog_transaction_compression` is set to `ON`. The statistics cover all transactions written to the binary log and relay log from the time the server was started or the table was truncated. Compressed transactions are grouped by the compression algorithm used, and uncompressed transactions are grouped together with the compression algorithm stated as `NONE`, so the compression ratio can be calculated.

The `binary_log_transaction_compression_stats` table has these columns:

- `LOG_TYPE`

Whether these transactions were written to the binary log or relay log.

- [COMPRESSION\\_TYPE](#)

The compression algorithm used to compress the transaction payloads. [NONE](#) means the payloads for these transactions were not compressed, which is correct in a number of situations (see [Section 7.4.4.5, “Binary Log Transaction Compression”](#)).

- [TRANSACTION\\_COUNTER](#)

The number of transactions written to this log type with this compression type.

- [COMPRESSED\\_BYTES](#)

The total number of bytes that were compressed and then written to this log type with this compression type, counted after compression.

- [UNCOMPRESSED\\_BYTES](#)

The total number of bytes before compression for this log type and this compression type.

- [COMPRESSION\\_PERCENTAGE](#)

The compression ratio for this log type and this compression type, expressed as a percentage.

- [FIRST\\_TRANSACTION\\_ID](#)

The ID of the first transaction that was written to this log type with this compression type.

- [FIRST\\_TRANSACTION\\_COMPRESSED\\_BYTES](#)

The total number of bytes that were compressed and then written to the log for the first transaction, counted after compression.

- [FIRST\\_TRANSACTION\\_UNCOMPRESSED\\_BYTES](#)

The total number of bytes before compression for the first transaction.

- [FIRST\\_TRANSACTION\\_TIMESTAMP](#)

The timestamp when the first transaction was written to the log.

- [LAST\\_TRANSACTION\\_ID](#)

The ID of the most recent transaction that was written to this log type with this compression type.

- [LAST\\_TRANSACTION\\_COMPRESSED\\_BYTES](#)

The total number of bytes that were compressed and then written to the log for the most recent transaction, counted after compression.

- [LAST\\_TRANSACTION\\_UNCOMPRESSED\\_BYTES](#)

The total number of bytes before compression for the most recent transaction.

- [LAST\\_TRANSACTION\\_TIMESTAMP](#)

The timestamp when the most recent transaction was written to the log.

The [binary\\_log\\_transaction\\_compression\\_stats](#) table has no indexes.

[TRUNCATE TABLE](#) is permitted for the [binary\\_log\\_transaction\\_compression\\_stats](#) table.

### 29.12.11.2 The replication\_applier\_configuration Table

This table shows the configuration parameters that affect transactions applied by the replica. Parameters stored in the table can be changed at runtime with the `CHANGE REPLICATION SOURCE TO` statement.

The `replication_applier_configuration` table has these columns:

- `CHANNEL_NAME`

The replication channel which this row is displaying. There is always a default replication channel, and more replication channels can be added. See [Section 19.2.2, “Replication Channels”](#) for more information.

- `DESIRED_DELAY`

The number of seconds that the replica must lag the source (`CHANGE REPLICATION SOURCE TO` option: `SOURCE_DELAY`). See [Section 19.4.11, “Delayed Replication”](#) for more information.

- `PRIVILEGE_CHECKS_USER`

The user account that provides the security context for the channel (`CHANGE REPLICATION SOURCE TO` option: `PRIVILEGE_CHECKS_USER`). This is escaped so that it can be copied into an SQL statement to execute individual transactions. See [Section 19.3.3, “Replication Privilege Checks”](#) for more information.

- `REQUIRE_ROW_FORMAT`

Whether the channel accepts only row-based events (`CHANGE REPLICATION SOURCE TO` option: `REQUIRE_ROW_FORMAT`). See [Section 19.3.3, “Replication Privilege Checks”](#) for more information.

- `REQUIRE_TABLE_PRIMARY_KEY_CHECK`

Whether the channel requires primary keys always, never, or according to the source's setting (`CHANGE REPLICATION SOURCE TO` option: `REQUIRE_TABLE_PRIMARY_KEY_CHECK`). See [Section 19.3.3, “Replication Privilege Checks”](#) for more information.

- `ASSIGN_GTIDS_TO_ANONYMOUS_TRANSACTIONS_TYPE`

Whether the channel assigns a GTID to replicated transactions that do not already have one (`CHANGE REPLICATION SOURCE TO` option: `ASSIGN_GTIDS_TO_ANONYMOUS_TRANSACTIONS`). `OFF` means no GTIDs are assigned. `LOCAL` means a GTID is assigned that includes the replica's own UUID (the `server_uuid` setting). `UUID` means a GTID is assigned that includes a manually set UUID. See [Section 19.1.3.6, “Replication From a Source Without GTIDs to a Replica With GTIDs”](#) for more information.

- `ASSIGN_GTIDS_TO_ANONYMOUS_TRANSACTIONS_VALUE`

The UUID that is used as part of the GTIDs assigned to anonymous transactions (`CHANGE REPLICATION SOURCE TO` option: `ASSIGN_GTIDS_TO_ANONYMOUS_TRANSACTIONS`). See [Section 19.1.3.6, “Replication From a Source Without GTIDs to a Replica With GTIDs”](#) for more information.

The `replication_applier_configuration` table has these indexes:

- Primary key on (`CHANNEL_NAME`)

`TRUNCATE TABLE` is not permitted for the `replication_applier_configuration` table.

The following table shows the correspondence between `replication_applier_configuration` columns and `SHOW REPLICA STATUS` columns.

<code>replication_applier_configuration</code> Column	SHOW REPLICA STATUS Column
<code>DESIRED_DELAY</code>	<code>SQL_Delay</code>

### 29.12.11.3 The `replication_applier_filters` Table

This table shows the replication channel specific filters configured on this replica. Each row provides information on a replication channel's configured type of filter. The `replication_applier_filters` table has these columns:

- `CHANNEL_NAME`

The name of replication channel with a replication filter configured.

- `FILTER_NAME`

The type of replication filter that has been configured for this replication channel.

- `FILTER_RULE`

The rules configured for the replication filter type using either `--replicate-*` command options or `CHANGE REPLICATION FILTER`.

- `CONFIGURED_BY`

The method used to configure the replication filter, can be one of:

- `CHANGE_REPLICATION_FILTER` configured by a global replication filter using a `CHANGE REPLICATION FILTER` statement.

- `STARTUP_OPTIONS` configured by a global replication filter using a `--replicate-*` option.

- `CHANGE_REPLICATION_FILTER_FOR_CHANNEL` configured by a channel specific replication filter using a `CHANGE REPLICATION FILTER FOR CHANNEL` statement.

- `STARTUP_OPTIONS_FOR_CHANNEL` configured by a channel specific replication filter using a `--replicate-*` option.

- `ACTIVE_SINCE`

Timestamp of when the replication filter was configured.

- `COUNTER`

The number of times the replication filter has been used since it was configured.

### 29.12.11.4 The `replication_applier_global_filters` Table

This table shows the global replication filters configured on this replica. The `replication_applier_global_filters` table has these columns:

- `FILTER_NAME`

The type of replication filter that has been configured.

- `FILTER_RULE`

The rules configured for the replication filter type using either `--replicate-*` command options or `CHANGE REPLICATION FILTER`.

- `CONFIGURED_BY`

The method used to configure the replication filter, can be one of:

- `CHANGE_REPLICATION_FILTER` configured by a global replication filter using a `CHANGE REPLICATION FILTER` statement.
- `STARTUP_OPTIONS` configured by a global replication filter using a `--replicate-*` option.
- `ACTIVE_SINCE`

Timestamp of when the replication filter was configured.

### 29.12.11.5 The `replication_applier_status` Table

This table shows the current general transaction execution status on the replica. The table provides information about general aspects of transaction applier status that are not specific to any thread involved. Thread-specific status information is available in the `replication_applier_status_by_coordinator` table (and `replication_applier_status_by_worker` if the replica is multithreaded).

The `replication_applier_status` table has these columns:

- `CHANNEL_NAME`

The replication channel which this row is displaying. There is always a default replication channel, and more replication channels can be added. See [Section 19.2.2, “Replication Channels”](#) for more information.

- `SERVICE_STATE`

Shows `ON` when the replication channel's applier threads are active or idle, `OFF` means that the applier threads are not active.

- `REMAINING_DELAY`

If the replica is waiting for `DESIRED_DELAY` seconds to pass since the source applied a transaction, this field contains the number of delay seconds remaining. At other times, this field is `NULL`. (The `DESIRED_DELAY` value is stored in the `replication_applier_configuration` table.) See [Section 19.4.11, “Delayed Replication”](#) for more information.

- `COUNT_TRANSACTIONS_RETRIES`

Shows the number of retries that were made because the replication SQL thread failed to apply a transaction. The maximum number of retries for a given transaction is set by the system variable `replica_transaction_retries`. The `replication_applier_status_by_worker` table shows detailed information on transaction retries for a single-threaded or multithreaded replica.

The `replication_applier_status` table has these indexes:

- Primary key on (`CHANNEL_NAME`)

`TRUNCATE TABLE` is not permitted for the `replication_applier_status` table.

The following table shows the correspondence between `replication_applier_status` columns and `SHOW REPLICAS STATUS` columns.

<code>replication_applier_status</code> Column	<code>SHOW REPLICAS STATUS</code> Column
<code>SERVICE_STATE</code>	<code>None</code>
<code>REMAINING_DELAY</code>	<code>SQL_Remaining_Delay</code>

### 29.12.11.6 The `replication_applier_status_by_coordinator` Table

For a multithreaded replica, the replica uses multiple worker threads and a coordinator thread to manage them, and this table shows the status of the coordinator thread. For a single-threaded replica, this table is empty. For a multithreaded replica, the [replication\\_applier\\_status\\_by\\_worker](#) table shows the status of the worker threads. This table provides information about the last transaction which was buffered by the coordinator thread to a worker's queue, as well as the transaction it is currently buffering. The start timestamp refers to when this thread read the first event of the transaction from the relay log to buffer it to a worker's queue, while the end timestamp refers to when the last event finished buffering to the worker's queue.

The [replication\\_applier\\_status\\_by\\_coordinator](#) table has these columns:

- [CHANNEL\\_NAME](#)

The replication channel which this row is displaying. There is always a default replication channel, and more replication channels can be added. See [Section 19.2.2, “Replication Channels”](#) for more information.

- [THREAD\\_ID](#)

The SQL/coordinator thread ID.

- [SERVICE\\_STATE](#)

[ON](#) (thread exists and is active or idle) or [OFF](#) (thread no longer exists).

- [LAST\\_ERROR\\_NUMBER](#), [LAST\\_ERROR\\_MESSAGE](#)

The error number and error message of the most recent error that caused the SQL/coordinator thread to stop. An error number of 0 and message which is an empty string means “no error”. If the [LAST\\_ERROR\\_MESSAGE](#) value is not empty, the error values also appear in the replica's error log.

Issuing [RESET BINARY LOGS AND GTIDS](#) or [RESET REPLICA](#) resets the values shown in these columns.

All error codes and messages displayed in the [LAST\\_ERROR\\_NUMBER](#) and [LAST\\_ERROR\\_MESSAGE](#) columns correspond to error values listed in [Server Error Message Reference](#).

- [LAST\\_ERROR\\_TIMESTAMP](#)

A timestamp in '[YYYY-MM-DD hh:mm:ss\[ .fraction \]](#)' format that shows when the most recent SQL/coordinator error occurred.

- [LAST\\_PROCESSED\\_TRANSACTION](#)

The global transaction ID (GTID) of the last transaction processed by this coordinator.

- [LAST\\_PROCESSED\\_TRANSACTION\\_ORIGINAL\\_COMMIT\\_TIMESTAMP](#)

A timestamp in '[YYYY-MM-DD hh:mm:ss\[ .fraction \]](#)' format that shows when the last transaction processed by this coordinator was committed on the original source.

- [LAST\\_PROCESSED\\_TRANSACTION\\_IMMEDIATE\\_COMMIT\\_TIMESTAMP](#)

A timestamp in '[YYYY-MM-DD hh:mm:ss\[ .fraction \]](#)' format that shows when the last transaction processed by this coordinator was committed on the immediate source.

- [LAST\\_PROCESSED\\_TRANSACTION\\_START\\_BUFFER\\_TIMESTAMP](#)

A timestamp in '[YYYY-MM-DD hh:mm:ss\[ .fraction \]](#)' format that shows when this coordinator thread started writing the last transaction to the buffer of a worker thread.

- [LAST\\_PROCESSED\\_TRANSACTION\\_END\\_BUFFER\\_TIMESTAMP](#)

A timestamp in '`YYYY-MM-DD hh:mm:ss[ .fraction ]`' format that shows when the last transaction was written to the buffer of a worker thread by this coordinator thread.

- `PROCESSING_TRANSACTION`

The global transaction ID (GTID) of the transaction that this coordinator thread is currently processing.

- `PROCESSING_TRANSACTION_ORIGINAL_COMMIT_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[ .fraction ]`' format that shows when the currently processing transaction was committed on the original source.

- `PROCESSING_TRANSACTION_IMMEDIATE_COMMIT_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[ .fraction ]`' format that shows when the currently processing transaction was committed on the immediate source.

- `PROCESSING_TRANSACTION_START_BUFFER_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[ .fraction ]`' format that shows when this coordinator thread started writing the currently processing transaction to the buffer of a worker thread.

When the Performance Schema is disabled, local timing information is not collected, so the fields showing the start and end timestamps for buffered transactions are zero.

The `replication_applier_status_by_coordinator` table has these indexes:

- Primary key on (`CHANNEL_NAME`)
- Index on (`THREAD_ID`)

The following table shows the correspondence between `replication_applier_status_by_coordinator` columns and `SHOW REPLICA STATUS` columns.

<code>replication_applier_status_by_coordinator</code> Column	<code>SHOW REPLICA STATUS</code> Column
<code>THREAD_ID</code>	None
<code>SERVICE_STATE</code>	<code>Replica_SQL_Running</code>
<code>LAST_ERROR_NUMBER</code>	<code>Last_SQL_Errno</code>
<code>LAST_ERROR_MESSAGE</code>	<code>Last_SQL_Error</code>
<code>LAST_ERROR_TIMESTAMP</code>	<code>Last_SQL_Error_Timestamp</code>

### 29.12.11.7 The `replication_applier_status_by_worker` Table

This table provides details of the transactions handled by applier threads on a replica or Group Replication group member. For a single-threaded replica, data is shown for the replica's single applier thread. For a multithreaded replica, data is shown individually for each applier thread. The applier threads on a multithreaded replica are sometimes called workers. The number of applier threads on a replica or Group Replication group member is set by the `replica_parallel_workers` system variable, which is set to zero for a single-threaded replica. A multithreaded replica also has a coordinator thread to manage the applier threads, and the status of this thread is shown in the `replication_applier_status_by_coordinator` table.

All error codes and messages displayed in the columns relating to errors correspond to error values listed in [Server Error Message Reference](#).

When the Performance Schema is disabled, local timing information is not collected, so the fields showing the start and end timestamps for applied transactions are zero. The start timestamps in this table refer to when the worker started applying the first event, and the end timestamps refer to when the last event of the transaction was applied.

When a replica is restarted by a `START REPLICA` statement, the columns beginning `APPLYING_TRANSACTION` are reset.

The `replication_applier_status_by_worker` table has these columns:

- `CHANNEL_NAME`

The replication channel which this row is displaying. There is always a default replication channel, and more replication channels can be added. See [Section 19.2.2, “Replication Channels”](#) for more information.

- `WORKER_ID`

The worker identifier (same value as the `id` column in the `mysql.slave_worker_info` table). After `STOP REPLICA`, the `THREAD_ID` column becomes `NULL`, but the `WORKER_ID` value is preserved.

- `THREAD_ID`

The worker thread ID.

- `SERVICE_STATE`

`ON` (thread exists and is active or idle) or `OFF` (thread no longer exists).

- `LAST_ERROR_NUMBER`, `LAST_ERROR_MESSAGE`

The error number and error message of the most recent error that caused the worker thread to stop. An error number of 0 and message of the empty string mean “no error”. If the `LAST_ERROR_MESSAGE` value is not empty, the error values also appear in the replica’s error log.

Issuing `RESET BINARY LOGS AND GTIDS` or `RESET REPLICA` resets the values shown in these columns.

- `LAST_ERROR_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[ .fraction ]`' format that shows when the most recent worker error occurred.

- `LAST_APPLIED_TRANSACTION`

The global transaction ID (GTID) of the last transaction applied by this worker.

- `LAST_APPLIED_TRANSACTION_ORIGINAL_COMMIT_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[ .fraction ]`' format that shows when the last transaction applied by this worker was committed on the original source.

- `LAST_APPLIED_TRANSACTION_IMMEDIATE_COMMIT_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[ .fraction ]`' format that shows when the last transaction applied by this worker was committed on the immediate source.

- `LAST_APPLIED_TRANSACTION_START_APPLY_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[ .fraction ]`' format that shows when this worker started applying the last applied transaction.

- [LAST\\_APPLIED\\_TRANSACTION\\_END\\_APPLY\\_TIMESTAMP](#)  
A timestamp in '`YYYY-MM-DD hh:mm:ss[ .fraction ]`' format that shows when this worker finished applying the last applied transaction.
- [APPLYING\\_TRANSACTION](#)  
The global transaction ID (GTID) of the transaction this worker is currently applying.
- [APPLYING\\_TRANSACTION\\_ORIGINAL\\_COMMIT\\_TIMESTAMP](#)  
A timestamp in '`YYYY-MM-DD hh:mm:ss[ .fraction ]`' format that shows when the transaction this worker is currently applying was committed on the original source.
- [APPLYING\\_TRANSACTION\\_IMMEDIATE\\_COMMIT\\_TIMESTAMP](#)  
A timestamp in '`YYYY-MM-DD hh:mm:ss[ .fraction ]`' format that shows when the transaction this worker is currently applying was committed on the immediate source.
- [APPLYING\\_TRANSACTION\\_START\\_APPLY\\_TIMESTAMP](#)  
A timestamp in '`YYYY-MM-DD hh:mm:ss[ .fraction ]`' format that shows when this worker started its first attempt to apply the transaction that is currently being applied.
- [LAST\\_APPLIED\\_TRANSACTION\\_RETRIES\\_COUNT](#)  
The number of times the last applied transaction was retried by the worker after the first attempt. If the transaction was applied at the first attempt, this number is zero.
- [LAST\\_APPLIED\\_TRANSACTION\\_LAST\\_TRANSIENT\\_ERROR\\_NUMBER](#)  
The error number of the last transient error that caused the transaction to be retried.
- [LAST\\_APPLIED\\_TRANSACTION\\_LAST\\_TRANSIENT\\_ERROR\\_MESSAGE](#)  
The message text for the last transient error that caused the transaction to be retried.
- [LAST\\_APPLIED\\_TRANSACTION\\_LAST\\_TRANSIENT\\_ERROR\\_TIMESTAMP](#)  
A timestamp in '`YYYY-MM-DD hh:mm:ss[ .fraction ]`' format for the last transient error that caused the transaction to be retried.
- [APPLYING\\_TRANSACTION\\_RETRIES\\_COUNT](#)  
The number of times the transaction that is currently being applied was retried until this moment. If the transaction was applied at the first attempt, this number is zero.
- [APPLYING\\_TRANSACTION\\_LAST\\_TRANSIENT\\_ERROR\\_NUMBER](#)  
The error number of the last transient error that caused the current transaction to be retried.
- [APPLYING\\_TRANSACTION\\_LAST\\_TRANSIENT\\_ERROR\\_MESSAGE](#)  
The message text for the last transient error that caused the current transaction to be retried.
- [APPLYING\\_TRANSACTION\\_LAST\\_TRANSIENT\\_ERROR\\_TIMESTAMP](#)  
A timestamp in '`YYYY-MM-DD hh:mm:ss[ .fraction ]`' format for the last transient error that caused the current transaction to be retried.

The `replication_applier_status_by_worker` table has these indexes:

- Primary key on (`CHANNEL_NAME`, `WORKER_ID`)

- Index on (`THREAD_ID`)

The following table shows the correspondence between `replication_applier_status_by_worker` columns and `SHOW REPLICA STATUS` columns.

<code>replication_applier_status_by_worker</code> Column	<code>SHOW REPLICA STATUS</code> Column
<code>WORKER_ID</code>	None
<code>THREAD_ID</code>	None
<code>SERVICE_STATE</code>	None
<code>LAST_ERROR_NUMBER</code>	<code>Last_SQL_Errno</code>
<code>LAST_ERROR_MESSAGE</code>	<code>Last_SQL_Error</code>
<code>LAST_ERROR_TIMESTAMP</code>	<code>Last_SQL_Error_Timestamp</code>

### 29.12.11.8 The `replication_asynchronous_connection_failover` Table

This table holds the replica's source lists for each replication channel for the asynchronous connection failover mechanism. The asynchronous connection failover mechanism automatically establishes an asynchronous (source to replica) replication connection to a new source from the appropriate list after the existing connection from the replica to its source fails. When asynchronous connection failover is enabled for a group of replicas managed by Group Replication, the source lists are broadcast to all group members when they join, and also when the lists change.

You set and manage source lists using the `asynchronous_connection_failover_add_source` and `asynchronous_connection_failover_delete_source` functions to add and remove replication source servers from the source list for a replication channel. To add and remove managed groups of servers, use the `asynchronous_connection_failover_add_managed` and `asynchronous_connection_failover_delete_managed` functions instead.

For more information, see [Section 19.4.9, “Switching Sources and Replicas with Asynchronous Connection Failover”](#).

The `replication_asynchronous_connection_failover` table has these columns:

- `CHANNEL_NAME`

The replication channel for which this replication source server is part of the source list. If this channel's connection to its current source fails, this replication source server is one of its potential new sources.

- `HOST`

The host name for this replication source server.

- `PORT`

The port number for this replication source server.

- `NETWORK_NAMESPACE`

The network namespace for this replication source server. If this value is empty, connections use the default (global) namespace.

- `WEIGHT`

The priority of this replication source server in the replication channel's source list. The weight is from 1 to 100, with 100 being the highest, and 50 being the default. When the asynchronous connection failover mechanism activates, the source with the highest weight setting among the alternative sources listed in the source list for the channel is chosen for the first connection attempt. If this

attempt does not work, the replica tries with all the listed sources in descending order of weight, then starts again from the highest weighted source. If multiple sources have the same weight, the replica orders them randomly.

- **MANAGED\_NAME**

The identifier for the managed group that the server is a part of. For the `GroupReplication` managed service, the identifier is the value of the `group_replication_group_name` system variable.

The `replication_asynchronous_connection_failover` table has these indexes:

- Primary key on (`CHANNEL_NAME`, `HOST`, `PORT`, `NETWORK_NAMESPACE`, `MANAGED_NAME`)

`TRUNCATE TABLE` is not permitted for the `replication_asynchronous_connection_failover` table.

### 29.12.11.9 The `replication_asynchronous_connection_failover_managed` Table

This table holds configuration information used by the replica's asynchronous connection failover mechanism to handle managed groups, including Group Replication topologies.

When you add a group member to the source list and define it as part of a managed group, the asynchronous connection failover mechanism updates the source list to keep it in line with membership changes, adding and removing group members automatically as they join or leave. When asynchronous connection failover is enabled for a group of replicas managed by Group Replication, the source lists are broadcast to all group members when they join, and also when the lists change.

The asynchronous connection failover mechanism fails over the connection if another available server on the source list has a higher priority (weight) setting. For a managed group, a source's weight is assigned depending on whether it is a primary or a secondary server. So assuming that you set up the managed group to give a higher weight to a primary and a lower weight to a secondary, when the primary changes, the higher weight is assigned to the new primary, so the replica changes over the connection to it. The asynchronous connection failover mechanism additionally changes connection if the currently connected managed source server leaves the managed group, or is no longer in the majority in the managed group. For more information, see [Section 19.4.9, “Switching Sources and Replicas with Asynchronous Connection Failover”](#).

The `replication_asynchronous_connection_failover_managed` table has these columns:

- **CHANNEL\_NAME**

The replication channel where the servers for this managed group operate.

- **MANAGED\_NAME**

The identifier for the managed group. For the `GroupReplication` managed service, the identifier is the value of the `group_replication_group_name` system variable.

- **MANAGED\_TYPE**

The type of managed service that the asynchronous connection failover mechanism provides for this group. The only value currently available is `GroupReplication`.

- **CONFIGURATION**

The configuration information for this managed group. For the `GroupReplication` managed service, the configuration shows the weights assigned to the group's primary server and to the group's secondary servers. For example: `{"Primary_weight": 80, "Secondary_weight": 60}`

- **Primary\_weight**: Integer between 0 and 100. Default value is 80.

- `Secondary_weight`: Integer between 0 and 100. Default value is 60.

The `replication_asynchronous_connection_failover_managed` table has these indexes:

- Primary key on (`CHANNEL_NAME`, `MANAGED_NAME`)

`TRUNCATE TABLE` is not permitted for the `replication_asynchronous_connection_failover_managed` table.

### 29.12.11.10 The `replication_group_communication_information` Table

This table shows group configuration options for the whole replication group. The table is available only when Group Replication is installed.

The `replication_group_communication_information` table has these columns:

- `WRITE_CONCURRENCY`

The maximum number of consensus instances that the group can execute in parallel. The default value is 10. See [Section 20.5.1.3, “Using Group Replication Group Write Consensus”](#).

- `PROTOCOL_VERSION`

The Group Replication communication protocol version, which determines what messaging capabilities are used. This is set to accommodate the oldest MySQL Server version that you want the group to support. See [Section 20.5.1.4, “Setting a Group’s Communication Protocol Version”](#).

- `WRITE_CONSENSUS_LEADERS_PREFERRED`

The leader or leaders that Group Replication has instructed the group communication engine to use to drive consensus. For a group in single-primary mode with the `group_replication_paxos_single_leader` system variable set to `ON` and the communication protocol version set to 8.0.27 or later, the single consensus leader is the group’s primary. Otherwise, all group members are used as leaders, so they are all shown here. See [Section 20.7.3, “Single Consensus Leader”](#).

- `WRITE_CONSENSUS_LEADERS_ACTUAL`

The actual leader or leader that the group communication engine is using to drive consensus. If a single consensus leader is in use for the group, and the primary is currently unhealthy, the group communication selects an alternative consensus leader. In this situation, the group member specified here can differ from the preferred group member.

- `WRITE_CONSENSUS_SINGLE_LEADER_CAPABLE`

Whether the replication group is capable of using a single consensus leader. 1 means that the group was started with the use of a single leader enabled (`group_replication_paxos_single_leader = ON`), and this is still shown if the value of `group_replication_paxos_single_leader` has since been changed on this group member. 0 means that the group was started with single leader mode disabled (`group_replication_paxos_single_leader = OFF`), or has a Group Replication communication protocol version that does not support the use of a single consensus leader (prior to 8.0.27). This information is only returned for group members in `ONLINE` or `RECOVERING` state.

- `MEMBER_FAILURE_SUSPICIONS_COUNT`

The address of each group member paired with the number of times this member has been seen as suspect by the local node. This information is displayed in JSON format. For a group with three members, the value of this column should appear similar to what is shown here:

```
{
```

```

 "d57da302-e404-4395-83b5-ff7cf9b7e055": 0,
 "6ace9d39-a093-4fe0-b24d-bacbaa34c339": 10,
 "9689c7c5-c71c-402a-a3a1-2f57bfc2ca62": 0
}

```

The `replication_group_communication_information` table has no indexes.

`TRUNCATE TABLE` is not permitted for the `replication_group_communication_information` table.

### 29.12.11.11 The `replication_connection_configuration` Table

This table shows the configuration parameters used by the replica for connecting to the source. Parameters stored in the table can be changed at runtime with the `CHANGE REPLICATION SOURCE TO` statement.

Compared to the `replication_connection_status` table, `replication_connection_configuration` changes less frequently. It contains values that define how the replica connects to the source and that remain constant during the connection, whereas `replication_connection_status` contains values that change during the connection.

The `replication_connection_configuration` table has the following columns. The column descriptions indicate the corresponding `CHANGE REPLICATION SOURCE TO` options from which the column values are taken, and the table given later in this section shows the correspondence between `replication_connection_configuration` columns and `SHOW REPLICAS STATUS` columns.

- `CHANNEL_NAME`

The replication channel which this row is displaying. There is always a default replication channel, and more replication channels can be added. See [Section 19.2.2, “Replication Channels”](#) for more information. (`CHANGE REPLICATION SOURCE TO` option: `FOR CHANNEL`)

- `HOST`

The host name of the source that the replica is connected to. (`CHANGE REPLICATION SOURCE TO` option: `SOURCE_HOST`)

- `PORT`

The port used to connect to the source. (`CHANGE REPLICATION SOURCE TO` option: `SOURCE_PORT`)

- `USER`

The user name of the replication user account used to connect to the source. (`CHANGE REPLICATION SOURCE TO` option: `SOURCE_USER`)

- `NETWORK_INTERFACE`

The network interface that the replica is bound to, if any. (`CHANGE REPLICATION SOURCE TO` option: `SOURCE_BIND`)

- `AUTO_POSITION`

1 if GTID auto-positioning is in use; otherwise 0. (`CHANGE REPLICATION SOURCE TO` option: `SOURCE_AUTO_POSITION`)

- `SSL_ALLOWED, SSL_CA_FILE, SSL_CA_PATH, SSL_CERTIFICATE, SSL_CIPHER, SSL_KEY, SSL_VERIFY_SERVER_CERTIFICATE, SSL_CRL_FILE, SSL_CRL_PATH`

These columns show the SSL parameters used by the replica to connect to the source, if any.

`SSL_ALLOWED` has these values:

- `Yes` if an SSL connection to the source is permitted
- `No` if an SSL connection to the source is not permitted
- `Ignored` if an SSL connection is permitted but the replica does not have SSL support enabled

(`CHANGE REPLICATION SOURCE TO` options for the other SSL columns: `SOURCE_SSL_CA`, `SOURCE_SSL_CAPATH`, `SOURCE_SSL_CERT`, `SOURCE_SSL_CIPHER`, `SOURCE_SSL_CRL`, `SOURCE_SSL_CRLPATH`, `SOURCE_SSL_KEY`, `SOURCE_SSL_VERIFY_SERVER_CERT`)

- `CONNECTION_RETRY_INTERVAL`

The number of seconds between connect retries. (`CHANGE REPLICATION SOURCE TO` option: `SOURCE_CONNECT_RETRY`)

- `CONNECTION_RETRY_COUNT`

The number of times the replica can attempt to reconnect to the source in the event of a lost connection. (`CHANGE REPLICATION SOURCE TO` option: `SOURCE_RETRY_COUNT`)

- `HEARTBEAT_INTERVAL`

The replication heartbeat interval on a replica, measured in seconds. (`CHANGE REPLICATION SOURCE TO` option: `SOURCE_HEARTBEAT_PERIOD`)

- `TLS_VERSION`

The list of TLS protocol versions that are permitted by the replica for the replication connection. For TLS version information, see [Section 8.3.2, “Encrypted Connection TLS Protocols and Ciphers”](#). (`CHANGE REPLICATION SOURCE TO` option: `SOURCE_TLS_VERSION`)

- `TLS_CIPHERSUITES`

The list of ciphersuites that are permitted by the replica for the replication connection. For TLS ciphersuite information, see [Section 8.3.2, “Encrypted Connection TLS Protocols and Ciphers”](#). (`CHANGE REPLICATION SOURCE TO` option: `SOURCE_TLS_CIPHERSUITES`)

- `PUBLIC_KEY_PATH`

The path name to a file containing a replica-side copy of the public key required by the source for RSA key pair-based password exchange. The file must be in PEM format. This column applies to replicas that authenticate with the `sha256_password` (deprecated) or `caching_sha2_password` authentication plugin. (`CHANGE REPLICATION SOURCE TO` option: `SOURCE_PUBLIC_KEY_PATH`)

If `PUBLIC_KEY_PATH` is given and specifies a valid public key file, it takes precedence over `GET_PUBLIC_KEY`.

- `GET_PUBLIC_KEY`

Whether to request from the source the public key required for RSA key pair-based password exchange. This column applies to replicas that authenticate with the `caching_sha2_password` authentication plugin. For that plugin, the source does not send the public key unless requested. (`CHANGE REPLICATION SOURCE TO` option: `GET_SOURCE_PUBLIC_KEY`)

If `PUBLIC_KEY_PATH` is given and specifies a valid public key file, it takes precedence over `GET_PUBLIC_KEY`.

- `NETWORK_NAMESPACE`

The network namespace name; empty if the connection uses the default (global) namespace. For information about network namespaces, see [Section 7.1.14, “Network Namespace Support”](#).

- [COMPRESSION\\_ALGORITHM](#)

The permitted compression algorithms for connections to the source. ([CHANGE REPLICATION SOURCE TO](#) option: [SOURCE\\_COMPRESSION\\_ALGORITHMS](#))

For more information, see [Section 6.2.8, “Connection Compression Control”](#).

- [ZSTD\\_COMPRESSION\\_LEVEL](#)

The compression level to use for connections to the source that use the `zstd` compression algorithm. ([CHANGE REPLICATION SOURCE TO](#) option: [SOURCE\\_ZSTD\\_COMPRESSION\\_LEVEL](#))

For more information, see [Section 6.2.8, “Connection Compression Control”](#).

- [SOURCE\\_CONNECTION\\_AUTO\\_FAILOVER](#)

Whether the asynchronous connection failover mechanism is activated for this replication channel. ([CHANGE REPLICATION SOURCE TO](#) option: [SOURCE\\_CONNECTION\\_AUTO\\_FAILOVER](#))

For more information, see [Section 19.4.9, “Switching Sources and Replicas with Asynchronous Connection Failover”](#).

- [GTID\\_ONLY](#)

Indicates if this channel only uses GTIDs for the transaction queueing and application process and for recovery, and does not persist binary log and relay log file names and file positions in the replication metadata repositories. ([CHANGE REPLICATION SOURCE TO](#) option: [GTID\\_ONLY](#))

For more information, see [Section 20.4.1, “GTIDs and Group Replication”](#).

The `replication_connection_configuration` table has these indexes:

- Primary key on ([CHANNEL\\_NAME](#))

`TRUNCATE TABLE` is not permitted for the `replication_connection_configuration` table.

The following table shows the correspondence between `replication_connection_configuration` columns and `SHOW REPLICA STATUS` columns.

<code>replication_connection_configuration</code> Column	<code>SHOW REPLICA STATUS</code> Column
<code>CHANNEL_NAME</code>	<code>Channel_name</code>
<code>HOST</code>	<code>Source_Host</code>
<code>PORT</code>	<code>Source_Port</code>
<code>USER</code>	<code>Source_User</code>
<code>NETWORK_INTERFACE</code>	<code>Source_Bind</code>
<code>AUTO_POSITION</code>	<code>Auto_Position</code>
<code>SSL_ALLOWED</code>	<code>Source_SSL_Allowed</code>
<code>SSL_CA_FILE</code>	<code>Source_SSL_CA_File</code>
<code>SSL_CA_PATH</code>	<code>Source_SSL_CA_Path</code>
<code>SSL_CERTIFICATE</code>	<code>Source_SSL_Cert</code>
<code>SSL_CIPHER</code>	<code>Source_SSL_Cipher</code>
<code>SSL_KEY</code>	<code>Source_SSL_Key</code>
<code>SSL_VERIFY_SERVER_CERTIFICATE</code>	<code>Source_SSL_Verify_Server_Cert</code>
<code>SSL_CRL_FILE</code>	<code>Source_SSL_Crl</code>

<code>replication_connection_configuration</code> Column	SHOW REPLICA STATUS Column
<code>SSL_CRL_PATH</code>	<code>Source_SSL_Crlpath</code>
<code>CONNECTION_RETRY_INTERVAL</code>	<code>Source_Connect_Retry</code>
<code>CONNECTION_RETRY_COUNT</code>	<code>Source_Retry_Count</code>
<code>HEARTBEAT_INTERVAL</code>	<code>None</code>
<code>TLS_VERSION</code>	<code>Source_TLS_Version</code>
<code>PUBLIC_KEY_PATH</code>	<code>Source_public_key_path</code>
<code>GET_PUBLIC_KEY</code>	<code>Get_source_public_key</code>
<code>NETWORK_NAMESPACE</code>	<code>Network_Namespace</code>
<code>COMPRESSION_ALGORITHM</code>	<code>[None]</code>
<code>ZSTD_COMPRESSION_LEVEL</code>	<code>[None]</code>
<code>GTID_ONLY</code>	<code>[None]</code>

### 29.12.11.12 The `replication_group_configuration_version` Table

This table displays the version of the member actions configuration for replication group members. The table is available only when Group Replication is installed. Whenever a member action is enabled or disabled using the `group_replication_enable_member_action()` and `group_replication_disable_member_action()` functions, the version number is incremented. You can reset the member actions configuration using the `group_replication_reset_member_actions()` function, which resets the member actions configuration to the default settings, and resets its version number to 1. For more information, see [Section 20.5.1.5, “Configuring Member Actions”](#).

The `replication_group_configuration_version` table has these columns:

- `NAME`

The name of the configuration.

- `VERSION`

The version number of the configuration.

The `replication_group_configuration_version` table has no indexes.

`TRUNCATE TABLE` is not permitted for the `replication_group_configuration_version` table.

### 29.12.11.13 The `replication_connection_status` Table

This table shows the current status of the I/O thread that handles the replica's connection to the source, information on the last transaction queued in the relay log, and information on the transaction currently being queued in the relay log.

Compared to the `replication_connection_configuration` table, `replication_connection_status` changes more frequently. It contains values that change during the connection, whereas `replication_connection_configuration` contains values which define how the replica connects to the source and that remain constant during the connection.

The `replication_connection_status` table has these columns:

- `CHANNEL_NAME`

The replication channel which this row is displaying. There is always a default replication channel, and more replication channels can be added. See [Section 19.2.2, “Replication Channels”](#) for more information.

- [GROUP\\_NAME](#)

If this server is a member of a group, shows the name of the group the server belongs to.

- [SOURCE\\_UUID](#)

The `server_uuid` value from the source.

- [THREAD\\_ID](#)

The I/O thread ID.

- [SERVICE\\_STATE](#)

`ON` (thread exists and is active or idle), `OFF` (thread no longer exists), or `CONNECTING` (thread exists and is connecting to the source).

- [RECEIVED\\_TRANSACTION\\_SET](#)

The set of global transaction IDs (GTIDs) corresponding to all transactions received by this replica. Empty if GTIDs are not in use. See [GTID Sets](#) for more information.

- [LAST\\_ERROR\\_NUMBER, LAST\\_ERROR\\_MESSAGE](#)

The error number and error message of the most recent error that caused the I/O thread to stop. An error number of 0 and message of the empty string mean “no error.” If the `LAST_ERROR_MESSAGE` value is not empty, the error values also appear in the replica’s error log.

Issuing `RESET BINARY LOGS AND GTIDS` or `RESET REPLICA` resets the values shown in these columns.

- [LAST\\_ERROR\\_TIMESTAMP](#)

A timestamp in '`YYYY-MM-DD hh:mm:ss[ .fraction ]`' format that shows when the most recent I/O error took place.

- [LAST\\_HEARTBEAT\\_TIMESTAMP](#)

A timestamp in '`YYYY-MM-DD hh:mm:ss[ .fraction ]`' format that shows when the most recent heartbeat signal was received by a replica.

- [COUNT\\_RECEIVED\\_HEARTBEATS](#)

The total number of heartbeat signals that a replica received since the last time it was restarted or reset, or a `CHANGE REPLICATION SOURCE TO` statement was issued.

- [LAST\\_QUEUED\\_TRANSACTION](#)

The global transaction ID (GTID) of the last transaction that was queued to the relay log.

- [LAST\\_QUEUED\\_TRANSACTION\\_ORIGINAL\\_COMMIT\\_TIMESTAMP](#)

A timestamp in '`YYYY-MM-DD hh:mm:ss[ .fraction ]`' format that shows when the last transaction queued in the relay log was committed on the original source.

- [LAST\\_QUEUED\\_TRANSACTION\\_IMMEDIATE\\_COMMIT\\_TIMESTAMP](#)

A timestamp in '`YYYY-MM-DD hh:mm:ss[ .fraction ]`' format that shows when the last transaction queued in the relay log was committed on the immediate source.

- [LAST\\_QUEUED\\_TRANSACTION\\_START\\_QUEUE\\_TIMESTAMP](#)

A timestamp in '`YYYY-MM-DD hh:mm:ss[ .fraction ]`' format that shows when the last transaction was placed in the relay log queue by this I/O thread.

- `LAST_QUEUED_TRANSACTION_END_QUEUE_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[ .fraction ]`' format that shows when the last transaction was queued to the relay log files.

- `QUEUEING_TRANSACTION`

The global transaction ID (GTID) of the currently queueing transaction in the relay log.

- `QUEUEING_TRANSACTION_ORIGINAL_COMMIT_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[ .fraction ]`' format that shows when the currently queueing transaction was committed on the original source.

- `QUEUEING_TRANSACTION_IMMEDIATE_COMMIT_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[ .fraction ]`' format that shows when the currently queueing transaction was committed on the immediate source.

- `QUEUEING_TRANSACTION_START_QUEUE_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[ .fraction ]`' format that shows when the first event of the currently queueing transaction was written to the relay log by this I/O thread.

When the Performance Schema is disabled, local timing information is not collected, so the fields showing the start and end timestamps for queued transactions are zero.

The `replication_connection_status` table has these indexes:

- Primary key on (`CHANNEL_NAME`)
- Index on (`THREAD_ID`)

The following table shows the correspondence between `replication_connection_status` columns and `SHOW REPLICAS STATUS` columns.

<code>replication_connection_status</code> Column	<code>SHOW REPLICAS STATUS</code> Column
<code>SOURCE_UUID</code>	<code>Master_UUID</code>
<code>THREAD_ID</code>	<code>None</code>
<code>SERVICE_STATE</code>	<code>Replica_IO_Running</code>
<code>RECEIVED_TRANSACTION_SET</code>	<code>Retrieved_Gtid_Set</code>
<code>LAST_ERROR_NUMBER</code>	<code>Last_IO_Errorno</code>
<code>LAST_ERROR_MESSAGE</code>	<code>Last_IO_Error</code>
<code>LAST_ERROR_TIMESTAMP</code>	<code>Last_IO_Error_Timestamp</code>

#### 29.12.11.14 The `replication_group_member_actions` Table

This table lists the member actions that are included in the member actions configuration for replication group members. The table is available only when Group Replication is installed. You can reset the member actions configuration using the `group_replication_reset_member_actions()` function. For more information, see [Section 20.5.1.5, “Configuring Member Actions”](#).

The `replication_group_member_actions` table has these columns:

- `NAME`

The name of the member action.

- `EVENT`

The event that triggers the member action.

- [ENABLED](#)

Whether the member action is currently enabled. Member actions can be enabled using the `group_replication_enable_member_action()` function and disabled using the `group_replication_disable_member_action()` function.

- [TYPE](#)

The type of member action. [INTERNAL](#) is an action that is provided by the Group Replication plugin.

- [PRIORITY](#)

The priority of the member action. Actions with lower priority values are actioned first.

- [ERROR\\_HANDLING](#)

The action that Group Replication takes if an error occurs when the member action is being carried out. [IGNORE](#) means that an error message is logged to say that the member action failed, but no further action is taken. [CRITICAL](#) means that the member moves into [ERROR](#) state, and takes the action specified by the `group_replication_exit_state_action` system variable.

The `replication_group_member_actions` table has no indexes.

`TRUNCATE TABLE` is not permitted for the `replication_group_member_actions` table.

### 29.12.11.15 The `replication_group_member_stats` Table

This table shows statistical information for replication group members. It is populated only when Group Replication is running.

The `replication_group_member_stats` table has these columns:

- [CHANNEL\\_NAME](#)

Name of the Group Replication channel

- [VIEW\\_ID](#)

Current view identifier for this group.

- [MEMBER\\_ID](#)

The member server UUID. This has a different value for each member in the group. This also serves as a key because it is unique to each member.

- [COUNT\\_TRANSACTIONS\\_IN\\_QUEUE](#)

The number of transactions in the queue pending conflict detection checks. Once the transactions have been checked for conflicts, if they pass the check, they are queued to be applied as well.

- [COUNT\\_TRANSACTIONS\\_CHECKED](#)

The number of transactions that have been checked for conflicts.

- [COUNT\\_CONFLICTS\\_DETECTED](#)

The number of transactions that have not passed the conflict detection check.

- [COUNT\\_TRANSACTIONS\\_ROWS\\_VALIDATING](#)

Number of transaction rows which can be used for certification, but have not been garbage collected. Can be thought of as the current size of the conflict detection database against which each transaction is certified.

- `TRANSACTIONS_COMMITTED_ALL_MEMBERS`

The transactions that have been successfully committed on all members of the replication group, shown as [GTID Sets](#). This is updated at a fixed time interval.

- `LAST_CONFLICT_FREE_TRANSACTION`

The transaction identifier of the last conflict free transaction which was checked.

- `COUNT_TRANSACTIONS_REMOTE_IN_APPLIER_QUEUE`

The number of transactions that this member has received from the replication group which are waiting to be applied.

- `COUNT_TRANSACTIONS_REMOTE_APPLIED`

Number of transactions this member has received from the group and applied.

- `COUNT_TRANSACTIONS_LOCAL_PROPOSED`

Number of transactions which originated on this member and were sent to the group.

- `COUNT_TRANSACTIONS_LOCAL_ROLLBACK`

Number of transactions which originated on this member and were rolled back by the group.

The `replication_group_member_stats` table has no indexes.

`TRUNCATE TABLE` is not permitted for the `replication_group_member_stats` table.

### 29.12.11.16 The `replication_group_members` Table

This table shows network and status information for replication group members. The network addresses shown are the addresses used to connect clients to the group, and should not be confused with the member's internal group communication address specified by `group_replication_local_address`.

The `replication_group_members` table has these columns:

- `CHANNEL_NAME`

Name of the Group Replication channel.

- `MEMBER_ID`

The member server UUID. This has a different value for each member in the group. This also serves as a key because it is unique to each member.

- `MEMBER_HOST`

Network address of this member (host name or IP address). Retrieved from the member's `hostname` variable. This is the address which clients connect to, unlike the `group_replication_local_address` which is used for internal group communication.

- `MEMBER_PORT`

Port on which the server is listening. Retrieved from the member's `port` variable.

- [MEMBER\\_STATE](#)

Current state of this member; can be any one of the following:

- [ONLINE](#): The member is in a fully functioning state.
- [RECOVERING](#): The server has joined a group from which it is retrieving data.
- [OFFLINE](#): The group replication plugin is installed but has not been started.
- [ERROR](#): The member has encountered an error, either during applying transactions or during the recovery phase, and is not participating in the group's transactions.
- [UNREACHABLE](#): The failure detection process suspects that this member cannot be contacted, because the group messages have timed out.

See [Section 20.4.2, “Group Replication Server States”](#).

- [MEMBER\\_ROLE](#)

Role of the member in the group, either [PRIMARY](#) or [SECONDARY](#).

- [MEMBER\\_VERSION](#)

MySQL version of the member.

- [MEMBER\\_COMMUNICATION\\_STACK](#)

The communication stack used for the group, either the [XCOM](#) communication stack or the [MYSQL](#) communication stack.

The `replication_group_members` table has no indexes.

`TRUNCATE TABLE` is not permitted for the `replication_group_members` table.

## 29.12.12 Performance Schema NDB Cluster Tables

The following table shows all Performance Schema tables relating to the [NDBCLUSTER](#) storage engine.

**Table 29.3 Performance Schema NDB Tables**

Table Name	Description
<code>ndb_sync_excluded_objects</code>	NDB objects which cannot be synchronized
<code>ndb_sync_pending_objects</code>	NDB objects waiting for synchronization

Automatic synchronization in [NDB](#) attempts to detect and synchronize automatically all mismatches in metadata between the NDB Cluster's internal dictionary and the MySQL Server's datadictionary. This is done by default in the background at regular intervals as determined by the `ndb_metadata_check_interval` system variable, unless disabled using `ndb_metadata_check` or overridden by setting `ndb_metadata_sync`.

Information about the current state of automatic synchronization is exposed by a MySQL server acting as an SQL node in an NDB Cluster in these two Performance Schema tables:

- [ndb\\_sync\\_pending\\_objects](#): Displays information about [NDB](#) database objects for which mismatches have been detected between the [NDB](#) dictionary and the MySQL data dictionary. When attempting to synchronize such objects, [NDB](#) removes the object from the queue awaiting synchronization, and from this table, and tries to reconcile the mismatch. If synchronization of the object fails due to a temporary error, it is picked up and added back to the queue (and to this table)

the next time `NDB` performs mismatch detection; if the attempts fails due a permanent error, the object is added to the `ndb_sync_excluded_objects` table.

- `ndb_sync_excluded_objects`: Shows information about `NDB` database objects for which automatic synchronization has failed due to permanent errors resulting from mismatches which cannot be reconciled without manual intervention; these objects are blocklisted and not considered again for mismatch detection until this has been done.

The `ndb_sync_pending_objects` and `ndb_sync_excluded_objects` tables are present only if MySQL has support enabled for the `NDBCLUSTER` storage engine.

These tables are described in more detail in the following two sections.

### 29.12.12.1 The `ndb_sync_pending_objects` Table

This table provides information about `NDB` database objects for which mismatches have been detected and which are waiting to be synchronized between the `NDB` dictionary and the MySQL data dictionary.

Example information about `NDB` database objects awaiting synchronization:

```
mysql> SELECT * FROM performance_schema.ndb_sync_pending_objects;
+-----+-----+-----+
| SCHEMA_NAME | NAME | TYPE |
+-----+-----+-----+
| NULL | lg1 | LOGFILE GROUP |
| NULL | ts1 | TABLESPACE |
| db1 | NULL | SCHEMA |
| test | t1 | TABLE |
| test | t2 | TABLE |
| test | t3 | TABLE |
+-----+-----+-----+
```

The `ndb_sync_pending_objects` table has these columns:

- `SCHEMA_NAME`: The name of the schema (database) in which the object awaiting synchronization resides; this is `NULL` for tablespaces and log file groups
- `NAME`: The name of the object awaiting synchronization; this is `NULL` if the object is a schema
- `TYPE`: The type of the object awaiting synchronization; this is one of `LOGFILE GROUP`, `TABLESPACE`, `SCHEMA`, or `TABLE`

### 29.12.12.2 The `ndb_sync_excluded_objects` Table

This table provides information about `NDB` database objects which cannot be automatically synchronized between NDB Cluster's dictionary and the MySQL data dictionary.

Example information about `NDB` database objects which cannot be synchronized with the MySQL data dictionary:

```
mysql> SELECT * FROM performance_schema.ndb_sync_excluded_objects\G
***** 1. row *****
SCHEMA_NAME: NULL
 NAME: lg1
 TYPE: LOGFILE GROUP
 REASON: Injected failure
***** 2. row *****
SCHEMA_NAME: NULL
 NAME: ts1
 TYPE: TABLESPACE
 REASON: Injected failure
***** 3. row *****
SCHEMA_NAME: db1
 NAME: NULL
 TYPE: SCHEMA
 REASON: Injected failure
***** 4. row *****
```

```

SCHEMA_NAME: test
 NAME: t1
 TYPE: TABLE
 REASON: Injected failure
***** 5. row *****
SCHEMA_NAME: test
 NAME: t2
 TYPE: TABLE
 REASON: Injected failure
***** 6. row *****
SCHEMA_NAME: test
 NAME: t3
 TYPE: TABLE
 REASON: Injected failure

```

The `ndb_sync_excluded_objects` table has these columns:

- `SCHEMA_NAME`: The name of the schema (database) in which the object which has failed to synchronize resides; this is `NULL` for tablespaces and log file groups
- `NAME`: The name of the object which has failed to synchronize; this is `NULL` if the object is a schema
- `TYPE`: The type of the object has failed to synchronize; this is one of `LOGFILE GROUP`, `TABLESPACE`, `SCHEMA`, or `TABLE`
- `REASON`: The reason for exclusion (blocklisting) of the object; that is, the reason for the failure to synchronize this object

Possible reasons include the following:

- `Injected failure`
- `Failed to determine if object existed in NDB`
- `Failed to determine if object existed in DD`
- `Failed to drop object in DD`
- `Failed to get undofiles assigned to logfile group`
- `Failed to get object id and version`
- `Failed to install object in DD`
- `Failed to get datafiles assigned to tablespace`
- `Failed to create schema`
- `Failed to determine if object was a local table`
- `Failed to invalidate table references`
- `Failed to set database name of NDB object`
- `Failed to get extra metadata of table`
- `Failed to migrate table with extra metadata version 1`
- `Failed to get object from DD`
- `Definition of table has changed in NDB Dictionary`
- `Failed to setup binlogging for table`

This list is not necessarily exhaustive, and is subject to change in future `NDB` releases.

## 29.12.13 Performance Schema Lock Tables

The Performance Schema exposes lock information through these tables:

- `data_locks`: Data locks held and requested
- `data_lock_waits`: Relationships between data lock owners and data lock requestors blocked by those owners
- `metadata_locks`: Metadata locks held and requested
- `table_handles`: Table locks held and requested

The following sections describe these tables in more detail.

### 29.12.13.1 The `data_locks` Table

The `data_locks` table shows data locks held and requested. For information about which lock requests are blocked by which held locks, see [Section 29.12.13.2, “The `data\_lock\_waits` Table”](#).

Example data lock information:

```
mysql> SELECT * FROM performance_schema.data_locks\G
***** 1. row *****
 ENGINE: INNODB
 ENGINE_LOCK_ID: 139664434886512:1059:139664350547912
ENGINE_TRANSACTION_ID: 2569
 THREAD_ID: 46
 EVENT_ID: 12
 OBJECT_SCHEMA: test
 OBJECT_NAME: t1
 PARTITION_NAME: NULL
SUBPARTITION_NAME: NULL
 INDEX_NAME: NULL
OBJECT_INSTANCE_BEGIN: 139664350547912
 LOCK_TYPE: TABLE
 LOCK_MODE: IX
 LOCK_STATUS: GRANTED
 LOCK_DATA: NULL
***** 2. row *****
 ENGINE: INNODB
 ENGINE_LOCK_ID: 139664434886512:2:4:1:139664350544872
ENGINE_TRANSACTION_ID: 2569
 THREAD_ID: 46
 EVENT_ID: 12
 OBJECT_SCHEMA: test
 OBJECT_NAME: t1
 PARTITION_NAME: NULL
SUBPARTITION_NAME: NULL
 INDEX_NAME: GEN_CLUST_INDEX
OBJECT_INSTANCE_BEGIN: 139664350544872
 LOCK_TYPE: RECORD
 LOCK_MODE: X
 LOCK_STATUS: GRANTED
 LOCK_DATA: supremum pseudo-record
```

Unlike most Performance Schema data collection, there are no instruments for controlling whether data lock information is collected or system variables for controlling data lock table sizes. The Performance Schema collects information that is already available in the server, so there is no memory or CPU overhead to generate this information or need for parameters that control its collection.

Use the `data_locks` table to help diagnose performance problems that occur during times of heavy concurrent load. For `InnoDB`, see the discussion of this topic at [Section 17.15.2, “InnoDB INFORMATION\\_SCHEMA Transaction and Locking Information”](#).

The `data_locks` table has these columns:

- `ENGINE`

The storage engine that holds or requested the lock.

- [ENGINE\\_LOCK\\_ID](#)

The ID of the lock held or requested by the storage engine. Tuples of ([ENGINE\\_LOCK\\_ID](#), [ENGINE](#)) values are unique.

Lock ID formats are internal and subject to change at any time. Applications should not rely on lock IDs having a particular format.

- [ENGINE\\_TRANSACTION\\_ID](#)

The storage engine internal ID of the transaction that requested the lock. This can be considered the owner of the lock, although the lock might still be pending, not actually granted yet ([LOCK\\_STATUS='WAITING'](#)).

If the transaction has not yet performed any write operation (is still considered read only), the column contains internal data that users should not try to interpret. Otherwise, the column is the transaction ID.

For [InnoDB](#), to obtain details about the transaction, join this column with the [TRX\\_ID](#) column of the [INFORMATION\\_SCHEMA INNODB\\_TRX](#) table.

- [THREAD\\_ID](#)

The thread ID of the session that created the lock. To obtain details about the thread, join this column with the [THREAD\\_ID](#) column of the Performance Schema [threads](#) table.

[THREAD\\_ID](#) can be used together with [EVENT\\_ID](#) to determine the event during which the lock data structure was created in memory. (This event might have occurred before this particular lock request occurred, if the data structure is used to store multiple locks.)

- [EVENT\\_ID](#)

The Performance Schema event that caused the lock. Tuples of ([THREAD\\_ID](#), [EVENT\\_ID](#)) values implicitly identify a parent event in other Performance Schema tables:

- The parent wait event in the [events\\_waits\\_xxx](#) tables
- The parent stage event in the [events\\_stages\\_xxx](#) tables
- The parent statement event in the [events\\_statements\\_xxx](#) tables
- The parent transaction event in the [events\\_transactions\\_current](#) table

To obtain details about the parent event, join the [THREAD\\_ID](#) and [EVENT\\_ID](#) columns with the columns of like name in the appropriate parent event table. See [Section 29.19.2, “Obtaining Parent Event Information”](#).

- [OBJECT\\_SCHEMA](#)

The schema that contains the locked table.

- [OBJECT\\_NAME](#)

The name of the locked table.

- [PARTITION\\_NAME](#)

The name of the locked partition, if any; [NULL](#) otherwise.

- [SUBPARTITION\\_NAME](#)

The name of the locked subpartition, if any; `NULL` otherwise.

- `INDEX_NAME`

The name of the locked index, if any; `NULL` otherwise.

In practice, `InnoDB` always creates an index (`GEN_CLUST_INDEX`), so `INDEX_NAME` is non-`NULL` for `InnoDB` tables.

- `OBJECT_INSTANCE_BEGIN`

The address in memory of the lock.

- `LOCK_TYPE`

The type of lock.

The value is storage engine dependent. For `InnoDB`, permitted values are `RECORD` for a row-level lock, `TABLE` for a table-level lock.

- `LOCK_MODE`

How the lock is requested.

The value is storage engine dependent. For `InnoDB`, permitted values are `S[ ,GAP ]`, `X[ ,GAP ]`, `IS[ ,GAP ]`, `IX[ ,GAP ]`, `AUTO_INC`, and `UNKNOWN`. Lock modes other than `AUTO_INC` and `UNKNOWN` indicate gap locks, if present. For information about `S`, `X`, `IS`, `IX`, and gap locks, refer to Section 17.7.1, “`InnoDB` Locking”.

- `LOCK_STATUS`

The status of the lock request.

The value is storage engine dependent. For `InnoDB`, permitted values are `GRANTED` (lock is held) and `WAITING` (lock is being waited for).

- `LOCK_DATA`

The data associated with the lock, if any. The value is storage engine dependent. For `InnoDB`, a value is shown if the `LOCK_TYPE` is `RECORD`, otherwise the value is `NULL`. Primary key values of the locked record are shown for a lock placed on the primary key index. Secondary index values of the locked record are shown with primary key values appended for a lock placed on a secondary index. If there is no primary key, `LOCK_DATA` shows either the key values of a selected unique index or the unique `InnoDB` internal row ID number, according to the rules governing `InnoDB` clustered index use (see Section 17.6.2.1, “Clustered and Secondary Indexes”). `LOCK_DATA` reports “supremum pseudo-record” for a lock taken on a supremum pseudo-record. If the page containing the locked record is not in the buffer pool because it was written to disk while the lock was held, `InnoDB` does not fetch the page from disk. Instead, `LOCK_DATA` reports `NULL`.

The `data_locks` table has these indexes:

- Primary key on (`ENGINE_LOCK_ID`, `ENGINE`)
- Index on (`ENGINE_TRANSACTION_ID`, `ENGINE`)
- Index on (`THREAD_ID`, `EVENT_ID`)
- Index on (`OBJECT_SCHEMA`, `OBJECT_NAME`, `PARTITION_NAME`, `SUBPARTITION_NAME`)

`TRUNCATE TABLE` is not permitted for the `data_locks` table.

## 29.12.13.2 The `data_lock_waits` Table

The `data_lock_waits` table implements a many-to-many relationship showing which data lock requests in the `data_locks` table are blocked by which held data locks in the `data_locks` table. Held locks in `data_locks` appear in `data_lock_waits` only if they block some lock request.

This information enables you to understand data lock dependencies between sessions. The table exposes not only which lock a session or transaction is waiting for, but which session or transaction currently holds that lock.

Example data lock wait information:

```
mysql> SELECT * FROM performance_schema.data_lock_waits\G
***** 1. row ****
 ENGINE: INNODB
REQUESTING_ENGINE_LOCK_ID: 140211201964816:2:4:2:140211086465800
REQUESTING_ENGINE_TRANSACTION_ID: 1555
 REQUESTING_THREAD_ID: 47
 REQUESTING_EVENT_ID: 5
REQUESTING_OBJECT_INSTANCE_BEGIN: 140211086465800
 BLOCKING_ENGINE_LOCK_ID: 140211201963888:2:4:2:140211086459880
 BLOCKING_ENGINE_TRANSACTION_ID: 1554
 BLOCKING_THREAD_ID: 46
 BLOCKING_EVENT_ID: 12
BLOCKING_OBJECT_INSTANCE_BEGIN: 140211086459880
```

Unlike most Performance Schema data collection, there are no instruments for controlling whether data lock information is collected or system variables for controlling data lock table sizes. The Performance Schema collects information that is already available in the server, so there is no memory or CPU overhead to generate this information or need for parameters that control its collection.

Use the `data_lock_waits` table to help diagnose performance problems that occur during times of heavy concurrent load. For InnoDB, see the discussion of this topic at [Section 17.15.2, “InnoDB INFORMATION\\_SCHEMA Transaction and Locking Information”](#).

Because the columns in the `data_lock_waits` table are similar to those in the `data_locks` table, the column descriptions here are abbreviated. For more detailed column descriptions, see [Section 29.12.13.1, “The data\\_locks Table”](#).

The `data_lock_waits` table has these columns:

- `ENGINE`

The storage engine that requested the lock.

- `REQUESTING_ENGINE_LOCK_ID`

The ID of the lock requested by the storage engine. To obtain details about the lock, join this column with the `ENGINE_LOCK_ID` column of the `data_locks` table.

- `REQUESTING_ENGINE_TRANSACTION_ID`

The storage engine internal ID of the transaction that requested the lock.

- `REQUESTING_THREAD_ID`

The thread ID of the session that requested the lock.

- `REQUESTING_EVENT_ID`

The Performance Schema event that caused the lock request in the session that requested the lock.

- `REQUESTING_OBJECT_INSTANCE_BEGIN`

The address in memory of the requested lock.

- [BLOCKING\\_ENGINE\\_LOCK\\_ID](#)

The ID of the blocking lock. To obtain details about the lock, join this column with the [ENGINE\\_LOCK\\_ID](#) column of the [data\\_locks](#) table.

- [BLOCKING\\_ENGINE\\_TRANSACTION\\_ID](#)

The storage engine internal ID of the transaction that holds the blocking lock.

- [BLOCKING\\_THREAD\\_ID](#)

The thread ID of the session that holds the blocking lock.

- [BLOCKING\\_EVENT\\_ID](#)

The Performance Schema event that caused the blocking lock in the session that holds it.

- [BLOCKING\\_OBJECT\\_INSTANCE\\_BEGIN](#)

The address in memory of the blocking lock.

The [data\\_lock\\_waits](#) table has these indexes:

- Index on ([REQUESTING\\_ENGINE\\_LOCK\\_ID](#), [ENGINE](#))
- Index on ([BLOCKING\\_ENGINE\\_LOCK\\_ID](#), [ENGINE](#))
- Index on ([REQUESTING\\_ENGINE\\_TRANSACTION\\_ID](#), [ENGINE](#))
- Index on ([BLOCKING\\_ENGINE\\_TRANSACTION\\_ID](#), [ENGINE](#))
- Index on ([REQUESTING\\_THREAD\\_ID](#), [REQUESTING\\_EVENT\\_ID](#))
- Index on ([BLOCKING\\_THREAD\\_ID](#), [BLOCKING\\_EVENT\\_ID](#))

[TRUNCATE TABLE](#) is not permitted for the [data\\_lock\\_waits](#) table.

### 29.12.13.3 The [metadata\\_locks](#) Table

MySQL uses metadata locking to manage concurrent access to database objects and to ensure data consistency; see [Section 10.11.4, “Metadata Locking”](#). Metadata locking applies not just to tables, but also to schemas, stored programs (procedures, functions, triggers, scheduled events), tablespaces, user locks acquired with the [GET\\_LOCK\(\)](#) function (see [Section 14.14, “Locking Functions”](#)), and locks acquired with the locking service described in [Section 7.6.9.1, “The Locking Service”](#).

The Performance Schema exposes metadata lock information through the [metadata\\_locks](#) table:

- Locks that have been granted (shows which sessions own which current metadata locks).
- Locks that have been requested but not yet granted (shows which sessions are waiting for which metadata locks).
- Lock requests that have been killed by the deadlock detector.
- Lock requests that have timed out and are waiting for the requesting session's lock request to be discarded.

This information enables you to understand metadata lock dependencies between sessions. You can see not only which lock a session is waiting for, but which session currently holds that lock.

The [metadata\\_locks](#) table is read only and cannot be updated. It is autosized by default; to configure the table size, set the [performance\\_schema\\_max\\_metadata\\_locks](#) system variable at server startup.

Metadata lock instrumentation uses the `wait/lock/metadata/sql/mdl` instrument, which is enabled by default.

To control metadata lock instrumentation state at server startup, use lines like these in your `my.cnf` file:

- Enable:

```
[mysqld]
performance-schema-instrument='wait/lock/metadata/sql/mdl=ON'
```

- Disable:

```
[mysqld]
performance-schema-instrument='wait/lock/metadata/sql/mdl=OFF'
```

To control metadata lock instrumentation state at runtime, update the `setup_instruments` table:

- Enable:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'YES', TIMED = 'YES'
WHERE NAME = 'wait/lock/metadata/sql/mdl';
```

- Disable:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'NO', TIMED = 'NO'
WHERE NAME = 'wait/lock/metadata/sql/mdl';
```

The Performance Schema maintains `metadata_locks` table content as follows, using the `LOCK_STATUS` column to indicate the status of each lock:

- When a metadata lock is requested and obtained immediately, a row with a status of `GRANTED` is inserted.
- When a metadata lock is requested and not obtained immediately, a row with a status of `PENDING` is inserted.
- When a metadata lock previously requested is granted, its row status is updated to `GRANTED`.
- When a metadata lock is released, its row is deleted.
- When a pending lock request is canceled by the deadlock detector to break a deadlock (`ER_LOCK_DEADLOCK`), its row status is updated from `PENDING` to `VICTIM`.
- When a pending lock request times out (`ER_LOCK_WAIT_TIMEOUT`), its row status is updated from `PENDING` to `TIMEOUT`.
- When granted lock or pending lock request is killed, its row status is updated from `GRANTED` or `PENDING` to `KILLED`.
- The `VICTIM`, `TIMEOUT`, and `KILLED` status values are brief and signify that the lock row is about to be deleted.
- The `PRE_ACQUIRE_NOTIFY` and `POST_RELEASE_NOTIFY` status values are brief and signify that the metadata locking subsystem is notifying interested storage engines while entering lock acquisition operations or leaving lock release operations.

The `metadata_locks` table has these columns:

- `OBJECT_TYPE`

The type of lock used in the metadata lock subsystem. The value is one of `GLOBAL`, `SCHEMA`, `TABLE`, `FUNCTION`, `PROCEDURE`, `TRIGGER` (currently unused), `EVENT`, `COMMIT`, `USER LEVEL LOCK`, `TABLESPACE`, `BACKUP LOCK`, or `LOCKING SERVICE`.

A value of `USER_LEVEL_LOCK` indicates a lock acquired with `GET_LOCK()`. A value of `LOCKING_SERVICE` indicates a lock acquired with the locking service described in [Section 7.6.9.1, “The Locking Service”](#).

- `OBJECT_SCHEMA`

The schema that contains the object.

- `OBJECT_NAME`

The name of the instrumented object.

- `OBJECT_INSTANCE_BEGIN`

The address in memory of the instrumented object.

- `LOCK_TYPE`

The lock type from the metadata lock subsystem. The value is one of `INTENTION_EXCLUSIVE`, `SHARED`, `SHARED_HIGH_PRIO`, `SHARED_READ`, `SHARED_WRITE`, `SHARED_UPGRADABLE`, `SHARED_NO_WRITE`, `SHARED_NO_READ_WRITE`, or `EXCLUSIVE`.

- `LOCK_DURATION`

The lock duration from the metadata lock subsystem. The value is one of `STATEMENT`, `TRANSACTION`, or `EXPLICIT`. The `STATEMENT` and `TRANSACTION` values signify locks that are released implicitly at statement or transaction end, respectively. The `EXPLICIT` value signifies locks that survive statement or transaction end and are released by explicit action, such as global locks acquired with `FLUSH TABLES WITH READ LOCK`.

- `LOCK_STATUS`

The lock status from the metadata lock subsystem. The value is one of `PENDING`, `GRANTED`, `VICTIM`, `TIMEOUT`, `KILLED`, `PRE_ACQUIRE_NOTIFY`, or `POST_RELEASE_NOTIFY`. The Performance Schema assigns these values as described previously.

- `SOURCE`

The name of the source file containing the instrumented code that produced the event and the line number in the file at which the instrumentation occurs. This enables you to check the source to determine exactly what code is involved.

- `OWNER_THREAD_ID`

The thread requesting a metadata lock.

- `OWNER_EVENT_ID`

The event requesting a metadata lock.

The `metadata_locks` table has these indexes:

- Primary key on (`OBJECT_INSTANCE_BEGIN`)
- Index on (`OBJECT_TYPE`, `OBJECT_SCHEMA`, `OBJECT_NAME`)
- Index on (`OWNER_THREAD_ID`, `OWNER_EVENT_ID`)

`TRUNCATE TABLE` is not permitted for the `metadata_locks` table.

#### 29.12.13.4 The `table_handles` Table

The Performance Schema exposes table lock information through the `table_handles` table to show the table locks currently in effect for each opened table handle. `table_handles` reports what is recorded by the table lock instrumentation. This information shows which table handles the server has open, how they are locked, and by which sessions.

The `table_handles` table is read only and cannot be updated. It is autosized by default; to configure the table size, set the `performance_schema_max_table_handles` system variable at server startup.

Table lock instrumentation uses the `wait/lock/table/sql/handler` instrument, which is enabled by default.

To control table lock instrumentation state at server startup, use lines like these in your `my.cnf` file:

- Enable:

```
[mysqld]
performance-schema-instrument='wait/lock/table/sql/handler=ON'
```

- Disable:

```
[mysqld]
performance-schema-instrument='wait/lock/table/sql/handler=OFF'
```

To control table lock instrumentation state at runtime, update the `setup_instruments` table:

- Enable:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'YES', TIMED = 'YES'
WHERE NAME = 'wait/lock/table/sql/handler';
```

- Disable:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'NO', TIMED = 'NO'
WHERE NAME = 'wait/lock/table/sql/handler';
```

The `table_handles` table has these columns:

- `OBJECT_TYPE`

The table opened by a table handle.

- `OBJECT_SCHEMA`

The schema that contains the object.

- `OBJECT_NAME`

The name of the instrumented object.

- `OBJECT_INSTANCE_BEGIN`

The table handle address in memory.

- `OWNER_THREAD_ID`

The thread owning the table handle.

- `OWNER_EVENT_ID`

The event which caused the table handle to be opened.

- `INTERNAL_LOCK`

The table lock used at the SQL level. The value is one of `READ`, `READ WITH SHARED LOCKS`, `READ HIGH PRIORITY`, `READ NO INSERT`, `WRITE ALLOW WRITE`, `WRITE CONCURRENT INSERT`, `WRITE LOW PRIORITY`, or `WRITE`. For information about these lock types, see the `include/` `thr_lock.h` source file.

- `EXTERNAL_LOCK`

The table lock used at the storage engine level. The value is one of `READ EXTERNAL` or `WRITE EXTERNAL`.

The `table_handles` table has these indexes:

- Primary key on (`OBJECT_INSTANCE_BEGIN`)
- Index on (`OBJECT_TYPE`, `OBJECT_SCHEMA`, `OBJECT_NAME`)
- Index on (`OWNER_THREAD_ID`, `OWNER_EVENT_ID`)

`TRUNCATE TABLE` is not permitted for the `table_handles` table.

## 29.12.14 Performance Schema System Variable Tables

The MySQL server maintains many system variables that indicate how it is configured (see [Section 7.1.8, “Server System Variables”](#)). System variable information is available in these Performance Schema tables:

- `global_variables`: Global system variables. An application that wants only global values should use this table.
- `session_variables`: System variables for the current session. An application that wants all system variable values for its own session should use this table. It includes the session variables for its session, as well as the values of global variables that have no session counterpart.
- `variables_by_thread`: Session system variables for each active session. An application that wants to know the session variable values for specific sessions should use this table. It includes session variables only, identified by thread ID.
- `persisted_variables`: Provides a SQL interface to the `mysqld-auto.cnf` file that stores persisted global system variable settings. See [Section 29.12.14.1, “Performance Schema persisted\\_variables Table”](#).
- `variables_info`: Shows, for each system variable, the source from which it was most recently set, and its range of values. See [Section 29.12.14.2, “Performance Schema variables\\_info Table”](#).

The `SENSITIVE_VARIABLES_OBSERVER` privilege is required to view the values of sensitive system variables in these tables.

The session variable tables (`session_variables`, `variables_by_thread`) contain information only for active sessions, not terminated sessions.

The `global_variables` and `session_variables` tables have these columns:

- `VARIABLE_NAME`

The system variable name.

- `VARIABLE_VALUE`

The system variable value. For `global_variables`, this column contains the global value. For `session_variables`, this column contains the variable value in effect for the current session.

The `global_variables` and `session_variables` tables have these indexes:

- Primary key on `(VARIABLE_NAME)`

The `variables_by_thread` table has these columns:

- `THREAD_ID`

The thread identifier of the session in which the system variable is defined.

- `VARIABLE_NAME`

The system variable name.

- `VARIABLE_VALUE`

The session variable value for the session named by the `THREAD_ID` column.

The `variables_by_thread` table has these indexes:

- Primary key on `(THREAD_ID, VARIABLE_NAME)`

The `variables_by_thread` table contains system variable information only about foreground threads. If not all threads are instrumented by the Performance Schema, this table misses some rows. In this case, the `Performance_schema_thread_instances_lost` status variable is greater than zero.

`TRUNCATE TABLE` is not supported for Performance Schema system variable tables.

#### 29.12.14.1 Performance Schema `persisted_variables` Table

The `persisted_variables` table provides an SQL interface to the `mysqld-auto.cnf` file that stores persisted global system variable settings, enabling the file contents to be inspected at runtime using `SELECT` statements. Variables are persisted using `SET PERSIST` or `PERSIST_ONLY` statements; see [Section 15.7.6.1, “SET Syntax for Variable Assignment”](#). The table contains a row for each persisted system variable in the file. Variables not persisted do not appear in the table.

The `SENSITIVE_VARIABLES_OBSERVER` privilege is required to view the values of sensitive system variables in this table.

For information about persisted system variables, see [Section 7.1.9.3, “Persisted System Variables”](#).

Suppose that `mysqld-auto.cnf` looks like this (slightly reformatted):

```
{
 "Version": 1,
 "mysql_server": {
 "max_connections": {
 "Value": "1000",
 "Metadata": {
 "Timestamp": 1.519921706e+15,
 "User": "root",
 "Host": "localhost"
 }
 },
 "autocommit": {
 "Value": "ON",
 "Metadata": {
 "Timestamp": 1.519921707e+15,
 "User": "root",
 "Host": "localhost"
 }
 }
 }
}
```

Then `persisted_variables` has these contents:

```
mysql> SELECT * FROM performance_schema.persisted_variables;
+-----+-----+
| VARIABLE_NAME | VARIABLE_VALUE |
+-----+-----+
| autocommit | ON |
| max_connections | 1000 |
+-----+-----+
```

The `persisted_variables` table has these columns:

- `VARIABLE_NAME`

The variable name listed in `mysqld-auto.cnf`.

- `VARIABLE_VALUE`

The value listed for the variable in `mysqld-auto.cnf`.

`persisted_variables` has these indexes:

- Primary key on (`VARIABLE_NAME`)

`TRUNCATE TABLE` is not permitted for the `persisted_variables` table.

#### 29.12.14.2 Performance Schema variables\_info Table

The `variables_info` table shows, for each system variable, the source from which it was most recently set, and its range of values.

The `variables_info` table has these columns:

- `VARIABLE_NAME`

The variable name.

- `VARIABLE_SOURCE`

The source from which the variable was most recently set:

- `COMMAND_LINE`

The variable was set on the command line.

- `COMPILED`

The variable has its compiled-in default value. `COMPILED` is the value used for variables not set any other way.

- `DYNAMIC`

The variable was set at runtime. This includes variables set within files specified using the `init_file` system variable.

- `EXPLICIT`

The variable was set from an option file named with the `--defaults-file` option.

- `EXTRA`

The variable was set from an option file named with the `--defaults-extra-file` option.

- `GLOBAL`

The variable was set from a global option file. This includes option files not covered by `EXPLICIT`, `EXTRA`, `LOGIN`, `PERSISTED`, `SERVER`, or `USER`.

- `LOGIN`

The variable was set from a user-specific login path file (`~/ .mylogin.cnf`).

- `PERSISTED`

The variable was set from a server-specific `mysqld-auto.cnf` option file. No row has this value if the server was started with `persisted_globals_load` disabled.

- `SERVER`

The variable was set from a server-specific `$MYSQL_HOME/my.cnf` option file. For details about how `MYSQL_HOME` is set, see [Section 6.2.2.2, “Using Option Files”](#).

- `USER`

The variable was set from a user-specific `~/ .my.cnf` option file.

- `VARIABLE_PATH`

If the variable was set from an option file, `VARIABLE_PATH` is the path name of that file. Otherwise, the value is the empty string.

- `MIN_VALUE`

The minimum permitted value for the variable. For a variable whose type is not numeric, this is always 0.

- `MAX_VALUE`

The maximum permitted value for the variable. For a variable whose type is not numeric, this is always 0.

- `SET_TIME`

The time at which the variable was most recently set. The default is the time at which the server initialized global system variables during startup.

- `SET_USER`, `SET_HOST`

The user name and host name of the client user that most recently set the variable.

If a client connects as `user17` from host `host34.example.com` using the account `'user17'@'% .example.com`, `SET_USER` and `SET_HOST` are `user17` and `host34.example.com`, respectively. For proxy user connections, these values correspond to the external (proxy) user, not the proxied user against which privilege checking is performed. The default for each column is the empty string, indicating that the variable has not been set since server startup.

The `variables_info` table has no indexes.

`TRUNCATE TABLE` is not permitted for the `variables_info` table.

If a variable with a `VARIABLE_SOURCE` value other than `DYNAMIC` is set at runtime, `VARIABLE_SOURCE` becomes `DYNAMIC` and `VARIABLE_PATH` becomes the empty string.

A system variable that has only a session value (such as `debug_sync`) cannot be set at startup or persisted. For session-only system variables, `VARIABLE_SOURCE` can be only `COMPILED` or `DYNAMIC`.

If a system variable has an unexpected `VARIABLE_SOURCE` value, consider your server startup method. For example, `mysqld_safe` reads option files and passes certain options it finds there as part

of the command line that it uses to start `mysqld`. Consequently, some system variables that you set in option files might display in `variables_info` as `COMMAND_LINE`, rather than as `GLOBAL` or `SERVER` as you might otherwise expect.

Some sample queries that use the `variables_info` table, with representative output:

- Display variables set on the command line:

```
mysql> SELECT VARIABLE_NAME
 FROM performance_schema.variables_info
 WHERE VARIABLE_SOURCE = 'COMMAND_LINE'
 ORDER BY VARIABLE_NAME;
+-----+
| VARIABLE_NAME |
+-----+
| basedir |
| datadir |
| log_error |
| pid_file |
| plugin_dir |
| port |
+-----+
```

- Display variables set from persistent storage:

```
mysql> SELECT VARIABLE_NAME
 FROM performance_schema.variables_info
 WHERE VARIABLE_SOURCE = 'PERSISTED'
 ORDER BY VARIABLE_NAME;
+-----+
| VARIABLE_NAME |
+-----+
| event_scheduler |
| max_connections |
| validate_password.policy |
+-----+
```

- Join `variables_info` with the `global_variables` table to display the current values of persisted variables, together with their range of values:

```
mysql> SELECT
 VI.VARIABLE_NAME, GV.VARIABLE_VALUE,
 VI.MIN_VALUE, VI.MAX_VALUE
 FROM performance_schema.variables_info AS VI
 INNER JOIN performance_schema.global_variables AS GV
 USING(VARIABLE_NAME)
 WHERE VI.VARIABLE_SOURCE = 'PERSISTED'
 ORDER BY VARIABLE_NAME;
+-----+-----+-----+-----+
| VARIABLE_NAME | VARIABLE_VALUE | MIN_VALUE | MAX_VALUE |
+-----+-----+-----+-----+
| event_scheduler | ON | 0 | 0 |
| max_connections | 200 | 1 | 100000 |
| validate_password.policy | STRONG | 0 | 0 |
+-----+-----+-----+-----+
```

## 29.12.15 Performance Schema Status Variable Tables

The MySQL server maintains many status variables that provide information about its operation (see [Section 7.1.10, “Server Status Variables”](#)). Status variable information is available in these Performance Schema tables:

- `global_status`: Global status variables. An application that wants only global values should use this table.
- `session_status`: Status variables for the current session. An application that wants all status variable values for its own session should use this table. It includes the session variables for its session, as well as the values of global variables that have no session counterpart.

- `status_by_thread`: Session status variables for each active session. An application that wants to know the session variable values for specific sessions should use this table. It includes session variables only, identified by thread ID.

There are also summary tables that provide status variable information aggregated by account, host name, and user name. See [Section 29.12.20.12, “Status Variable Summary Tables”](#).

The session variable tables (`session_status`, `status_by_thread`) contain information only for active sessions, not terminated sessions.

The Performance Schema collects statistics for global status variables only for threads for which the `INSTRUMENTED` value is `YES` in the `threads` table. Statistics for session status variables are always collected, regardless of the `INSTRUMENTED` value.

The Performance Schema does not collect statistics for `Com_xxx` status variables in the status variable tables. To obtain global and per-session statement execution counts, use the `events_statements_summary_global_by_event_name` and `events_statements_summary_by_thread_by_event_name` tables, respectively. For example:

```
SELECT EVENT_NAME, COUNT_STAR
FROM performance_schema.events_statements_summary_global_by_event_name
WHERE EVENT_NAME LIKE 'statement/sql%';
```

The `global_status` and `session_status` tables have these columns:

- `VARIABLE_NAME`

The status variable name.

- `VARIABLE_VALUE`

The status variable value. For `global_status`, this column contains the global value. For `session_status`, this column contains the variable value for the current session.

The `global_status` and `session_status` tables have these indexes:

- Primary key on (`VARIABLE_NAME`)

The `status_by_thread` table contains the status of each active thread. It has these columns:

- `THREAD_ID`

The thread identifier of the session in which the status variable is defined.

- `VARIABLE_NAME`

The status variable name.

- `VARIABLE_VALUE`

The session variable value for the session named by the `THREAD_ID` column.

The `status_by_thread` table has these indexes:

- Primary key on (`THREAD_ID`, `VARIABLE_NAME`)

The `status_by_thread` table contains status variable information only about foreground threads. If the `performance_schema_max_thread_instances` system variable is not autoscaled (signified by a value of `-1`) and the maximum permitted number of instrumented thread objects is not greater than the number of background threads, the table is empty.

The Performance Schema supports `TRUNCATE TABLE` for status variable tables as follows:

- `global_status`: Resets thread, account, host, and user status. Resets global status variables except those that the server never resets.
- `session_status`: Not supported.
- `status_by_thread`: Aggregates status for all threads to the global status and account status, then resets thread status. If account statistics are not collected, the session status is added to host and user status, if host and user status are collected.

Account, host, and user statistics are not collected if the `performance_schema_accounts_size`, `performance_schema_hosts_size`, and `performance_schema_users_size` system variables, respectively, are set to 0.

`FLUSH STATUS` adds the session status from all active sessions to the global status variables, resets the status of all active sessions, and resets account, host, and user status values aggregated from disconnected sessions.

## 29.12.16 Performance Schema Thread Pool Tables

The following sections describe the Performance Schema tables associated with the thread pool plugin (see [Section 7.6.3, “MySQL Enterprise Thread Pool”](#)). They provide information about thread pool operation:

- `tp_connections`: Information about thread pool connections.
- `tp_thread_group_state`: Information about thread pool thread group states.
- `tp_thread_group_stats`: Thread group statistics.
- `tp_thread_state`: Information about thread pool thread states.

Rows in these tables represent snapshots in time. In the case of `tp_thread_state`, all rows for a thread group comprise a snapshot in time. Thus, the MySQL server holds the mutex of the thread group while producing the snapshot. But it does not hold mutexes on all thread groups at the same time, to prevent a statement against `tp_thread_state` from blocking the entire MySQL server.

The Performance Schema thread pool tables are implemented by the thread pool plugin and are loaded and unloaded when that plugin is loaded and unloaded (see [Section 7.6.3.2, “Thread Pool Installation”](#)). No special configuration step for the tables is needed. However, the tables depend on the thread pool plugin being enabled. If the thread pool plugin is loaded but disabled, the tables are not created.

### 29.12.16.1 The `tp_connections` Table

The `tp_connections` table contains one row per connection managed by the Thread Pool plugin. Each row provides information about the current state of a thread pool connection.

The `tp_connections` table contains the following rows:

- `CONNECTION_ID`

The connection ID as reported by `SELECT CONNECTION_ID()`.

- `TP_GROUP_ID`

The index of the thread group in the global array. This column and `TP_PROCESSING_THREAD_NUMBER` serve as a foreign key into the `tp_thread_state` table.

- `TP_PROCESSING_THREAD_NUMBER`

This may be NULL if no thread is currently attached to the connection.

- **THREAD\_ID**

The Performance Schema thread ID.

- **STATE**

The connection state; this is one of `Established`, `Armed`, `Queued`, `Waiting for Credit`, `Attached`, `Expired`, or `Killed`.

- **ACTIVE\_FLAG**

When this is `0`, the connection is not attached to any worker thread.

- **KILLED\_STATE**

Reports the current stage in the process of killing the connection.

- **CLEANUP\_STATE**

Reports the current stage in the cleanup process when closing the connection.

- **TIME\_OF\_LAST\_EVENT\_COMPLETION**

Timestamp showing when the connection last processed a request.

- **TIME\_OF\_EXPIRY**

Timestamp showing when an idle connection will expire if no new request arrives before then; this is `NULL` when the thread is currently processing a request.

- **TIME\_OF\_ADD**

Timestamp showing when the connection was added to the thread pool's connection request queue.

- **TIME\_OF\_POP**

Timestamp showing when the connection was dequeued (popped) from the queue by a connection handler thread.

- **TIME\_OF\_ARM**

Timestamp showing when the connection file descriptor was last added to the set monitored by `poll()` or `epoll()`.

- **CONNECT\_HANDLER\_INDEX**

The index of the connection handler thread in the group which processed the connection request; a higher number means the connection load has triggered the creation of additional connection handler threads.

- **TYPE**

The connection type; this is one of `User`, `Admin_interface` or `Admin_privilege`; `Admin_privilege` means that this connection had been using the normal interface, but was placed in the `admin` group due to the user having the `TP_CONNECTION_ADMIN` privilege.

- **DIRECT\_QUERY\_EVENTS**

The number of queries executed directly by this connection.

- **QUEUED\_QUERY\_EVENTS**

The number of queued queries executed by this connection.

- `TIME_OF_EVENT_ARRIVAL`

A timestamp showing when `poll_wait()` returns with an event for the connection; this value is needed to calculate `MANAGEMENT_TIME`.

- `MANAGEMENT_TIME`

The accumulated time between the return from waiting on file descriptors; this includes the time spent queued for queries which are not executed directly.

### 29.12.16.2 The `tp_thread_group_state` Table

The `tp_thread_group_state` table has one row per thread group in the thread pool. Each row provides information about the current state of a group.

The `tp_thread_group_state` table has these columns:

- `TP_GROUP_ID`

The thread group ID. This is a unique key within the table.

- `CONSUMER_THREADS`

The number of consumer threads. There is at most one thread ready to start executing if the active threads become stalled or blocked.

- `RESERVE_THREADS`

The number of threads in the reserved state. This means that they are not started until there is a need to wake a new thread and there is no consumer thread. This is where most threads end up when the thread group has created more threads than needed for normal operation. Often a thread group needs additional threads for a short while and then does not need them again for a while. In this case, they go into the reserved state and remain until needed again. They take up some extra memory resources, but no extra computing resources.

- `CONNECT_THREAD_COUNT`

The number of threads that are processing or waiting to process connection initialization and authentication. There can be a maximum of four connection threads per thread group; these threads expire after a period of inactivity.

- `CONNECTION_COUNT`

The number of connections using this thread group.

- `QUEUED_QUERIES`

The number of statements waiting in the high-priority queue.

- `QUEUED_TRANSACTIONS`

The number of statements waiting in the low-priority queue. These are the initial statements for transactions that have not started, so they also represent queued transactions.

- `STALL_LIMIT`

The value of the `thread_pool_stall_limit` system variable for the thread group. This is the same value for all thread groups.

- `PRIORITIES_KICKUP_TIMER`

The value of the `thread_pool_prio_kickup_timer` system variable for the thread group. This is the same value for all thread groups.

- [ALGORITHM](#)

The value of the `thread_pool_algorithm` system variable for the thread group. This is the same value for all thread groups.

- [THREAD\\_COUNT](#)

The number of threads started in the thread pool as part of this thread group.

- [ACTIVE\\_THREAD\\_COUNT](#)

The number of threads active in executing statements.

- [STALLED\\_THREAD\\_COUNT](#)

The number of stalled statements in the thread group. A stalled statement could be executing, but from a thread pool perspective it is stalled and making no progress. A long-running statement quickly ends up in this category.

- [WAITING\\_THREAD\\_NUMBER](#)

If there is a thread handling the polling of statements in the thread group, this specifies the thread number within this thread group. It is possible that this thread could be executing a statement.

- [OLDEST\\_QUEUED](#)

How long in milliseconds the oldest queued statement has been waiting for execution.

- [MAX\\_THREAD\\_IDS\\_IN\\_GROUP](#)

The maximum thread ID of the threads in the group. This is the same as `MAX(TP_THREAD_NUMBER)` for the threads when selected from the `tp_thread_state` table. That is, these two queries are equivalent:

```
SELECT TP_GROUP_ID, MAX_THREAD_IDS_IN_GROUP
FROM tp_thread_group_state;
```

```
SELECT TP_GROUP_ID, MAX(TP_THREAD_NUMBER)
FROM tp_thread_state GROUP BY TP_GROUP_ID;
```

- [EFFECTIVE\\_MAX\\_TRANSACTIONS\\_LIMIT](#)

The effective `max_transactions_limit_per_tg` value for the group.

- [NUM\\_QUERY\\_THREADS](#)

The number of worker threads in the group.

- [TIME\\_OF\\_LAST\\_THREAD\\_CREATION](#)

The point in time when the thread was last created.

- [NUM\\_CONNECT\\_HANDLER\\_THREAD\\_IN\\_SLEEP](#)

The number of inactive connection handler threads.

- [THREADS\\_BOUND\\_TO\\_TRANSACTION](#)

The number of threads in an active transaction, which must be less than `thread_pool_max_transactions_limit`; this is set only when `thread_pool_max_transactions_limit` is not 0.

- [QUERY\\_THREADS\\_COUNT](#)

same as num\_query\_threads, but used for different purposes?

- `TIME_OF_EARLIEST_CON_EXPIRE`

A timestamp showing the earliest point in time when a connection is expected to expire.

The `tp_thread_group_state` table has one index; this is a unique index on the `TP_GROUP_ID` column.

`TRUNCATE TABLE` is not permitted for the `tp_thread_group_state` table.

### 29.12.16.3 The `tp_thread_group_stats` Table

The `tp_thread_group_stats` table reports statistics per thread group. There is one row per group.

The `tp_thread_group_stats` table has these columns:

- `TP_GROUP_ID`

The thread group ID. This is a unique key within the table.

- `CONNECTIONS_STARTED`

The number of connections started.

- `CONNECTIONS_CLOSED`

The number of connections closed.

- `QUERIES_EXECUTED`

The number of statements executed. This number is incremented when a statement starts executing, not when it finishes.

- `QUERIES_QUEUED`

The number of statements received that were queued for execution. This does not count statements that the thread group was able to begin executing immediately without queuing, which can happen under the conditions described in [Section 7.6.3.3, “Thread Pool Operation”](#).

- `THREADS_STARTED`

The number of threads started.

- `PRIORITIES_KICKUPS`

The number of statements that have been moved from low-priority queue to high-priority queue based on the value of the `thread_pool_prio_kickup_timer` system variable. If this number increases quickly, consider increasing the value of that variable. A quickly increasing counter means that the priority system is not keeping transactions from starting too early. For InnoDB, this most likely means deteriorating performance due to too many concurrent transactions..

- `STALLED_QUERIES_EXECUTED`

The number of statements that have become defined as stalled due to executing for longer than the value of the `thread_pool_stall_limit` system variable.

- `BECOME_CONSUMER_THREAD`

The number of times threads have been assigned the consumer thread role.

- `BECOME_RESERVE_THREAD`

The number of times threads have been assigned the reserve thread role.

- [BECOME\\_WAITING\\_THREAD](#)

The number of times threads have been assigned the waiter thread role. When statements are queued, this happens very often, even in normal operation, so rapid increases in this value are normal in the case of a highly loaded system where statements are queued up.

- [WAKE\\_THREAD\\_STALL\\_CHECKER](#)

The number of times the stall check thread decided to wake or create a thread to possibly handle some statements or take care of the waiter thread role.

- [SLEEP\\_WAITS](#)

The number of `THD_WAIT_SLEEP` waits. These occur when threads go to sleep (for example, by calling the `SLEEP()` function).

- [DISK\\_IO\\_WAITS](#)

The number of `THD_WAIT_DISKIO` waits. These occur when threads perform disk I/O that is likely to not hit the file system cache. Such waits occur when the buffer pool reads and writes data to disk, not for normal reads from and writes to files.

- [ROW\\_LOCK\\_WAITS](#)

The number of `THD_WAIT_ROW_LOCK` waits for release of a row lock by another transaction.

- [GLOBAL\\_LOCK\\_WAITS](#)

The number of `THD_WAIT_GLOBAL_LOCK` waits for a global lock to be released.

- [META\\_DATA\\_LOCK\\_WAITS](#)

The number of `THD_WAIT_META_DATA_LOCK` waits for a metadata lock to be released.

- [TABLE\\_LOCK\\_WAITS](#)

The number of `THD_WAIT_TABLE_LOCK` waits for a table to be unlocked that the statement needs to access.

- [USER\\_LOCK\\_WAITS](#)

The number of `THD_WAIT_USER_LOCK` waits for a special lock constructed by the user thread.

- [BINLOG\\_WAITS](#)

The number of `THD_WAIT_BINLOG_WAITS` waits for the binary log to become free.

- [GROUP\\_COMMIT\\_WAITS](#)

The number of `THD_WAIT_GROUP_COMMIT` waits. These occur when a group commit must wait for the other parties to complete their part of a transaction.

- [FSYNC\\_WAITS](#)

The number of `THD_WAIT_SYNC` waits for a file sync operation.

The `tp_thread_group_stats` table has these indexes:

- Unique index on (`TP_GROUP_ID`)

`TRUNCATE TABLE` is not permitted for the `tp_thread_group_stats` table.

#### 29.12.16.4 The `tp_thread_state` Table

The `tp_thread_state` table has one row per thread created by the thread pool to handle connections.

The `tp_thread_state` table has these columns:

- `TP_GROUP_ID`  
The thread group ID.
- `TP_THREAD_NUMBER`

The ID of the thread within its thread group. `TP_GROUP_ID` and `TP_THREAD_NUMBER` together provide a unique key within the table.

- `PROCESS_COUNT`

The 10ms interval in which the statement that uses this thread is currently executing. 0 means no statement is executing, 1 means it is in the first 10ms, and so forth.

- `WAIT_TYPE`

The type of wait for the thread. `NULL` means the thread is not blocked. Otherwise, the thread is blocked by a call to `thd_wait_begin()` and the value specifies the type of wait. The `xxx_WAIT` columns of the `tp_thread_group_stats` table accumulate counts for each wait type.

The `WAIT_TYPE` value is a string that describes the type of wait, as shown in the following table.

**Table 29.4 tp\_thread\_state Table WAIT\_TYPE Values**

Wait Type	Meaning
<code>THD_WAIT_SLEEP</code>	Waiting for sleep
<code>THD_WAIT_DISKIO</code>	Waiting for Disk IO
<code>THD_WAIT_ROW_LOCK</code>	Waiting for row lock
<code>THD_WAIT_GLOBAL_LOCK</code>	Waiting for global lock
<code>THD_WAIT_META_DATA_LOCK</code>	Waiting for metadata lock
<code>THD_WAIT_TABLE_LOCK</code>	Waiting for table lock
<code>THD_WAIT_USER_LOCK</code>	Waiting for user lock
<code>THD_WAIT_BINLOG</code>	Waiting for binlog
<code>THD_WAIT_GROUP_COMMIT</code>	Waiting for group commit
<code>THD_WAIT_SYNC</code>	Waiting for fsync

- `TP_THREAD_TYPE`

The type of thread. The value shown in this column is one of `CONNECTION_HANDLER_WORKER_THREAD`, `LISTENER_WORKER_THREAD`, `QUERY_WORKER_THREAD`, or `TIMER_WORKER_THREAD`.

- `THREAD_ID`

This thread's unique identifier. The value is the same as that used in the `THREAD_ID` column of the Performance Schema `threads` table.

- `TIME_OF_ATTACH`:

Timestamp showing when the thread was attached, if attached to a connection; otherwise `NULL`.

- `MARKED_STALLED`:

This is `True` if this thread has been marked as stalled by the stall checker thread.

- `STATE`:

Possible values depend on the type of thread, as shown by the `TP_THREAD_TYPE` column:

- For worker threads (`QUERY_WORKER_THREAD`), this is one of `Managing`, `Polling`, `Processing Direct`, `Processing Queued`, `Sleeping Consumer`, or `Sleeping Reserve`.
- For connection handler threads (`CONNECTION_HANDLER_WORKER_THREAD`), this is one of `CH Processing`, `CH Sleeping Timed`, or `CH Sleeping Indefinite`.
- For the stall checker thread (`TIMER_WORKER_THREAD`), this is one of `SC Checking`, `SC Sleeping Short`, or `SC Sleeping Long`.

- `EVENT_COUNT`:

The accumulated number of events processed by this thread.

- `ACCUMULATED_EVENT_TIME`:

The wall clock time spent processing events.

- `EXEC_COUNT`:

The accumulated number of queries (statements) passed to the server for execution.

- `ACCUMULATED_EXEC_TIME`:

The wall clock time spent processing queries by the server.

The `tp_thread_state` table has one index; this is a unique index on the `TP_GROUP_ID` and `TP_THREAD_NUMBER` columns.

`TRUNCATE TABLE` is not permitted for the `tp_thread_state` table.

## 29.12.17 Performance Schema Firewall Tables

The following sections describe the Performance Schema tables associated with MySQL Enterprise Firewall (see [Section 8.4.7, “MySQL Enterprise Firewall”](#)). They provide information about firewall operation:

- `firewall_groups`: Information about firewall group profiles.
- `firewall_group_allowlist`: Allowlist rules of registered firewall group profiles.
- `firewall_membership`: Members (accounts) of registered firewall group profiles.

### 29.12.17.1 The `firewall_groups` Table

The `firewall_groups` table provides a view into the in-memory data cache for MySQL Enterprise Firewall. It lists names and operational modes of registered firewall group profiles. It is used in conjunction with the `mysql.firewall_groups` system table that provides persistent storage of firewall data; see [MySQL Enterprise Firewall Tables](#).

The `firewall_groups` table has these columns:

- `NAME`

The group profile name.

- `MODE`

The current operational mode for the profile. Permitted mode values are `OFF`, `DETECTING`, `PROTECTING`, and `RECORDING`. For details about their meanings, see [Firewall Concepts](#).

- `USERHOST`

The training account for the group profile, to be used when the profile is in `RECORDING` mode. The value is `NULL`, or a non-`NULL` account that has the format `user_name@host_name`:

- If the value is `NULL`, the firewall records allowlist rules for statements received from any account that is a member of the group.
- If the value is non-`NULL`, the firewall records allowlist rules only for statements received from the named account (which should be a member of the group).

The `firewall_groups` table has no indexes.

`TRUNCATE TABLE` is not permitted for the `firewall_groups` table.

### 29.12.17.2 The `firewall_group_allowlist` Table

The `firewall_group_allowlist` table provides a view into the in-memory data cache for MySQL Enterprise Firewall. It lists allowlist rules of registered firewall group profiles. It is used in conjunction with the `mysql.firewall_group_allowlist` system table that provides persistent storage of firewall data; see [MySQL Enterprise Firewall Tables](#).

The `firewall_group_allowlist` table has these columns:

- `NAME`

The group profile name.

- `RULE`

A normalized statement indicating an acceptable statement pattern for the profile. A profile allowlist is the union of its rules.

The `firewall_group_allowlist` table has no indexes.

`TRUNCATE TABLE` is not permitted for the `firewall_group_allowlist` table.

### 29.12.17.3 The `firewall_membership` Table

The `firewall_membership` table provides a view into the in-memory data cache for MySQL Enterprise Firewall. It lists the members (accounts) of registered firewall group profiles. It is used in conjunction with the `mysql.firewall_membership` system table that provides persistent storage of firewall data; see [MySQL Enterprise Firewall Tables](#).

The `firewall_membership` table has these columns:

- `GROUP_ID`

The group profile name.

- `MEMBER_ID`

The name of an account that is a member of the profile.

The `firewall_membership` table has no indexes.

`TRUNCATE TABLE` is not permitted for the `firewall_membership` table.

## 29.12.18 Performance Schema Keyring Tables

---

The following sections describe the Performance Schema tables associated with the MySQL keyring (see [Section 8.4.4, “The MySQL Keyring”](#)). They provide information about keyring operation:

- `keyring_component_status`: Information about the keyring component in use.
- `keyring_keys`: Metadata for keys in the MySQL keyring.

### 29.12.18.1 The `keyring_component_status` Table

The `keyring_component_status` table provides status information about the properties of the keyring component in use, if one is installed. The table is empty if no keyring component is installed (for example, if the keyring is not being used, or is configured to manage the keystore using a keyring plugin rather than a keyring component).

There is no fixed set of properties. Each keyring component is free to define its own set.

Example `keyring_component_status` contents:

mysql> SELECT * FROM performance_schema.keyring_component_status;	
STATUS_KEY	STATUS_VALUE
Component_name	component_keyring_file
Author	Oracle Corporation
License	GPL
Implementation_name	component_keyring_file
Version	1.0
Component_status	Active
Data_file	/usr/local/mysql/keyring/component_keyring_file
Read_only	No

The `keyring_component_status` table has these columns:

- `STATUS_KEY`

The status item name.

- `STATUS_VALUE`

The status item value.

The `keyring_component_status` table has no indexes.

`TRUNCATE TABLE` is not permitted for the `keyring_component_status` table.

### 29.12.18.2 The `keyring_keys` table

MySQL Server supports a keyring that enables internal server components and plugins to securely store sensitive information for later retrieval. See [Section 8.4.4, “The MySQL Keyring”](#).

The `keyring_keys` table exposes metadata for keys in the keyring. Key metadata includes key IDs, key owners, and backend key IDs. The `keyring_keys` table does *not* expose any sensitive keyring data such as key contents.

The `keyring_keys` table has these columns:

- `KEY_ID`

The key identifier.

- `KEY_OWNER`

The owner of the key.

- `BACKEND_KEY_ID`

The ID used for the key by the keyring backend.

The `keyring_keys` table has no indexes.

`TRUNCATE TABLE` is not permitted for the `keyring_keys` table.

## 29.12.19 Performance Schema Clone Tables

The following sections describe the Performance Schema tables associated with the clone plugin (see [Section 7.6.7, “The Clone Plugin”](#)). The tables provide information about cloning operations.

- `clone_status`: status information about the current or last executed cloning operation.
- `clone_progress`: progress information about the current or last executed cloning operation.

The Performance Schema clone tables are implemented by the clone plugin and are loaded and unloaded when that plugin is loaded and unloaded (see [Section 7.6.7.1, “Installing the Clone Plugin”](#)). No special configuration step for the tables is needed. However, the tables depend on the clone plugin being enabled. If the clone plugin is loaded but disabled, the tables are not created.

The Performance Schema clone plugin tables are used only on the recipient MySQL server instance. The data is persisted across server shutdown and restart.

### 29.12.19.1 The `clone_status` Table

The `clone_status` table shows the status of the current or last executed cloning operation only. The table only ever contains one row of data, or is empty.

The `clone_status` table has these columns:

- `ID`

A unique cloning operation identifier in the current MySQL server instance.

- `PID`

Process list ID of the session executing the cloning operation.

- `STATE`

Current state of the cloning operation. Values include `Not Started`, `In Progress`, `Completed`, and `Failed`.

- `BEGIN_TIME`

A timestamp in '`YYYY-MM-DD hh:mm:ss[ .fraction ]`' format that shows when the cloning operation started.

- `END_TIME`

A timestamp in '`YYYY-MM-DD hh:mm:ss[ .fraction ]`' format that shows when the cloning operation finished. Reports NULL if the operation has not ended.

- `SOURCE`

The donor MySQL server address in '`HOST:PORT`' format. The column displays '`LOCAL INSTANCE`' for a local cloning operation.

- `DESTINATION`

The directory being cloned to.

- [ERROR\\_NO](#)

The error number reported for a failed cloning operation.

- [ERROR\\_MESSAGE](#)

The error message string for a failed cloning operation.

- [BINLOG\\_FILE](#)

The name of the binary log file up to which data is cloned.

- [BINLOG\\_POSITION](#)

The binary log file offset up to which data is cloned.

- [GTID\\_EXECUTED](#)

The GTID value for the last cloned transaction.

The `clone_status` table is read-only. DDL, including `TRUNCATE TABLE`, is not permitted.

## 29.12.19.2 The `clone_progress` Table

The `clone_progress` table shows progress information for the current or last executed cloning operation only.

The stages of a cloning operation include `DROP DATA`, `FILE COPY`, `PAGE_COPY`, `REDO_COPY`, `FILE_SYNC`, `RESTART`, and `RECOVERY`. A cloning operation produces a record for each stage. The table therefore only ever contains seven rows of data, or is empty.

The `clone_progress` table has these columns:

- [ID](#)

A unique cloning operation identifier in the current MySQL server instance.

- [STAGE](#)

The name of the current cloning stage. Stages include `DROP DATA`, `FILE COPY`, `PAGE_COPY`, `REDO_COPY`, `FILE_SYNC`, `RESTART`, and `RECOVERY`.

- [STATE](#)

The current state of the cloning stage. States include `Not Started`, `In Progress`, and `Completed`.

- [BEGIN\\_TIME](#)

A timestamp in '`YYYY-MM-DD hh:mm:ss[ .fraction ]`' format that shows when the cloning stage started. Reports NULL if the stage has not started.

- [END\\_TIME](#)

A timestamp in '`YYYY-MM-DD hh:mm:ss[ .fraction ]`' format that shows when the cloning stage finished. Reports NULL if the stage has not ended.

- [THREADS](#)

The number of concurrent threads used in the stage.

- [ESTIMATE](#)

The estimated amount of data for the current stage, in bytes.

- **DATA**

The amount of data transferred in current state, in bytes.

- **NETWORK**

The amount of network data transferred in the current state, in bytes.

- **DATA\_SPEED**

The current actual speed of data transfer, in bytes per second. This value may differ from the requested maximum data transfer rate defined by `clone_max_data_bandwidth`.

- **NETWORK\_SPEED**

The current speed of network transfer in bytes per second.

The `clone_progress` table is read-only. DDL, including `TRUNCATE TABLE`, is not permitted.

## 29.12.20 Performance Schema Summary Tables

Summary tables provide aggregated information for terminated events over time. The tables in this group summarize event data in different ways.

Each summary table has grouping columns that determine how to group the data to be aggregated, and summary columns that contain the aggregated values. Tables that summarize events in similar ways often have similar sets of summary columns and differ only in the grouping columns used to determine how events are aggregated.

Summary tables can be truncated with `TRUNCATE TABLE`. Generally, the effect is to reset the summary columns to 0 or `NULL`, not to remove rows. This enables you to clear collected values and restart aggregation. That might be useful, for example, after you have made a runtime configuration change. Exceptions to this truncation behavior are noted in individual summary table sections.

### Wait Event Summaries

**Table 29.5 Performance Schema Wait Event Summary Tables**

Table Name	Description
<code>events_waits_summary_by_account_by_event_name</code>	Wait events per account and event name
<code>events_waits_summary_by_host_by_event_name</code>	Wait events per host name and event name
<code>events_waits_summary_by_instance</code>	Wait events per instance
<code>events_waits_summary_by_thread_by_event_name</code>	Wait events per thread and event name
<code>events_waits_summary_by_user_by_event_name</code>	Wait events per user name and event name
<code>events_waits_summary_global_by_event_name</code>	Wait events per event name

### Stage Summaries

**Table 29.6 Performance Schema Stage Event Summary Tables**

Table Name	Description
<code>events_stages_summary_by_account_by_event_name</code>	Stage events per account and event name
<code>events_stages_summary_by_host_by_event_name</code>	Stage events per host name and event name
<code>events_stages_summary_by_thread_by_event_name</code>	Stage waits per thread and event name
<code>events_stages_summary_by_user_by_event_name</code>	Stage events per user name and event name
<code>events_stages_summary_global_by_event_name</code>	Stage waits per event name

## Statement Summaries

**Table 29.7 Performance Schema Statement Event Summary Tables**

Table Name	Description
<code>events_statements_histogram_by_digest</code>	Statement histograms per schema and digest value
<code>events_statements_histogram_global</code>	Statement histogram summarized globally
<code>events_statements_summary_by_account_by_event_name</code>	Statement events per account and event name
<code>events_statements_summary_by_digest</code>	Statement events per schema and digest value
<code>events_statements_summary_by_host_by_event_name</code>	Statement events per host name and event name
<code>events_statements_summary_by_program</code>	Statement events per stored program
<code>events_statements_summary_by_thread_by_event_name</code>	Statement events per thread and event name
<code>events_statements_summary_by_user_by_event_name</code>	Statement events per user name and event name
<code>events_statements_summary_global_by_event_name</code>	Statement events per event name
<code>prepared_statements_instances</code>	Prepared statement instances and statistics

## Transaction Summaries

**Table 29.8 Performance Schema Transaction Event Summary Tables**

Table Name	Description
<code>events_transactions_summary_by_account</code>	Transaction events per account and event name
<code>events_transactions_summary_by_host_by_event_name</code>	Transaction events per host name and event name
<code>events_transactions_summary_by_thread_by_event_name</code>	Transaction events per thread and event name
<code>events_transactions_summary_by_user_by_event_name</code>	Transaction events per user name and event name
<code>events_transactions_summary_global_by_event_name</code>	Transaction events per event name

## Object Wait Summaries

**Table 29.9 Performance Schema Object Event Summary Tables**

Table Name	Description
<code>objects_summary_global_by_type</code>	Object summaries

## File I/O Summaries

**Table 29.10 Performance Schema File I/O Event Summary Tables**

Table Name	Description
<code>file_summary_by_event_name</code>	File events per event name
<code>file_summary_by_instance</code>	File events per file instance

## Table I/O and Lock Wait Summaries

**Table 29.11 Performance Schema Table I/O and Lock Wait Event Summary Tables**

Table Name	Description
<code>table_io_waits_summary_by_index_usage</code>	Table I/O waits per index
<code>table_io_waits_summary_by_table</code>	Table I/O waits per table
<code>table_lock_waits_summary_by_table</code>	Table lock waits per table

## Socket Summaries

**Table 29.12 Performance Schema Socket Event Summary Tables**

Table Name	Description
socket_summary_by_event_name	Socket waits and I/O per event name
socket_summary_by_instance	Socket waits and I/O per instance

## Memory Summaries

**Table 29.13 Performance Schema Memory Operation Summary Tables**

Table Name	Description
memory_summary_by_account_by_event_name	Memory operations per account and event name
memory_summary_by_host_by_event_name	Memory operations per host and event name
memory_summary_by_thread_by_event_name	Memory operations per thread and event name
memory_summary_by_user_by_event_name	Memory operations per user and event name
memory_summary_global_by_event_name	Memory operations globally per event name

## Error Summaries

**Table 29.14 Performance Schema Error Summary Tables**

Table Name	Description
events_errors_summary_by_account_by_error	Errors per account and error code
events_errors_summary_by_host_by_error	Errors per host and error code
events_errors_summary_by_thread_by_error	Errors per thread and error code
events_errors_summary_by_user_by_error	Errors per user and error code
events_errors_summary_global_by_error	Errors per error code

## Status Variable Summaries

**Table 29.15 Performance Schema Error Status Variable Summary Tables**

Table Name	Description
status_by_account	Session status variables per account
status_by_host	Session status variables per host name
status_by_user	Session status variables per user name

### 29.12.20.1 Wait Event Summary Tables

The Performance Schema maintains tables for collecting current and recent wait events, and aggregates that information in summary tables. [Section 29.12.4, “Performance Schema Wait Event Tables”](#) describes the events on which wait summaries are based. See that discussion for information about the content of wait events, the current and recent wait event tables, and how to control wait event collection, which is disabled by default.

Example wait event summary information:

```
mysql> SELECT *
 FROM performance_schema.events_waits_summary_global_by_event_name\G
...
***** 6. row *****
EVENT_NAME: wait/synch/mutex/sql/BINARY_LOG::LOCK_index
COUNT_STAR: 8
SUM_TIMER_WAIT: 2119302
```

```

MIN_TIMER_WAIT: 196092
AVG_TIMER_WAIT: 264912
MAX_TIMER_WAIT: 569421
...
***** 9. row *****
EVENT_NAME: wait/synch/mutex/sql/hash_file::lock
COUNT_STAR: 69
SUM_TIMER_WAIT: 16848828
MIN_TIMER_WAIT: 0
AVG_TIMER_WAIT: 244185
MAX_TIMER_WAIT: 735345
...

```

Each wait event summary table has one or more grouping columns to indicate how the table aggregates events. Event names refer to names of event instruments in the `setup_instruments` table:

- `events_waits_summary_by_account_by_event_name` has `EVENT_NAME`, `USER`, and `HOST` columns. Each row summarizes events for a given account (user and host combination) and event name.
- `events_waits_summary_by_host_by_event_name` has `EVENT_NAME` and `HOST` columns. Each row summarizes events for a given host and event name.
- `events_waits_summary_by_instance` has `EVENT_NAME` and `OBJECT_INSTANCE_BEGIN` columns. Each row summarizes events for a given event name and object. If an instrument is used to create multiple instances, each instance has a unique `OBJECT_INSTANCE_BEGIN` value and is summarized separately in this table.
- `events_waits_summary_by_thread_by_event_name` has `THREAD_ID` and `EVENT_NAME` columns. Each row summarizes events for a given thread and event name.
- `events_waits_summary_by_user_by_event_name` has `EVENT_NAME` and `USER` columns. Each row summarizes events for a given user and event name.
- `events_waits_summary_global_by_event_name` has an `EVENT_NAME` column. Each row summarizes events for a given event name. An instrument might be used to create multiple instances of the instrumented object. For example, if there is an instrument for a mutex that is created for each connection, there are as many instances as there are connections. The summary row for the instrument summarizes over all these instances.

Each wait event summary table has these summary columns containing aggregated values:

- `COUNT_STAR`  
The number of summarized events. This value includes all events, whether timed or nontimed.
- `SUM_TIMER_WAIT`  
The total wait time of the summarized timed events. This value is calculated only for timed events because nontimed events have a wait time of `NULL`. The same is true for the other `xxx_TIMER_WAIT` values.
- `MIN_TIMER_WAIT`  
The minimum wait time of the summarized timed events.
- `AVG_TIMER_WAIT`  
The average wait time of the summarized timed events.
- `MAX_TIMER_WAIT`  
The maximum wait time of the summarized timed events.

The wait event summary tables have these indexes:

- `events_waits_summary_by_account_by_event_name`:
  - Primary key on (`USER`, `HOST`, `EVENT_NAME`)
- `events_waits_summary_by_host_by_event_name`:
  - Primary key on (`HOST`, `EVENT_NAME`)
- `events_waits_summary_by_instance`:
  - Primary key on (`OBJECT_INSTANCE_BEGIN`)
  - Index on (`EVENT_NAME`)
- `events_waits_summary_by_thread_by_event_name`:
  - Primary key on (`THREAD_ID`, `EVENT_NAME`)
- `events_waits_summary_by_user_by_event_name`:
  - Primary key on (`USER`, `EVENT_NAME`)
- `events_waits_summary_global_by_event_name`:
  - Primary key on (`EVENT_NAME`)

`TRUNCATE TABLE` is permitted for wait summary tables. It has these effects:

- For summary tables not aggregated by account, host, or user, truncation resets the summary columns to zero rather than removing rows.
- For summary tables aggregated by account, host, or user, truncation removes rows for accounts, hosts, or users with no connections, and resets the summary columns to zero for the remaining rows.

In addition, each wait summary table that is aggregated by account, host, user, or thread is implicitly truncated by truncation of the connection table on which it depends, or truncation of `events_waits_summary_global_by_event_name`. For details, see [Section 29.12.8, “Performance Schema Connection Tables”](#).

### 29.12.20.2 Stage Summary Tables

The Performance Schema maintains tables for collecting current and recent stage events, and aggregates that information in summary tables. [Section 29.12.5, “Performance Schema Stage Event Tables”](#) describes the events on which stage summaries are based. See that discussion for information about the content of stage events, the current and historical stage event tables, and how to control stage event collection, which is disabled by default.

Example stage event summary information:

```
mysql> SELECT *
 FROM performance_schema.events_stages_summary_global_by_event_name\G
...
***** 5. row *****
 EVENT_NAME: stage/sql/checking permissions
 COUNT_STAR: 57
SUM_TIMER_WAIT: 26501888880
MIN_TIMER_WAIT: 7317456
AVG_TIMER_WAIT: 464945295
MAX_TIMER_WAIT: 12858936792
...
***** 9. row *****
 EVENT_NAME: stage/sql/closing tables
 COUNT_STAR: 37
```

```
SUM_TIMER_WAIT: 662606568
MIN_TIMER_WAIT: 1593864
AVG_TIMER_WAIT: 17907891
MAX_TIMER_WAIT: 437977248
...
```

Each stage summary table has one or more grouping columns to indicate how the table aggregates events. Event names refer to names of event instruments in the `setup_instruments` table:

- `events_stages_summary_by_account_by_event_name` has `EVENT_NAME`, `USER`, and `HOST` columns. Each row summarizes events for a given account (user and host combination) and event name.
- `events_stages_summary_by_host_by_event_name` has `EVENT_NAME` and `HOST` columns. Each row summarizes events for a given host and event name.
- `events_stages_summary_by_thread_by_event_name` has `THREAD_ID` and `EVENT_NAME` columns. Each row summarizes events for a given thread and event name.
- `events_stages_summary_by_user_by_event_name` has `EVENT_NAME` and `USER` columns. Each row summarizes events for a given user and event name.
- `events_stages_summary_global_by_event_name` has an `EVENT_NAME` column. Each row summarizes events for a given event name.

Each stage summary table has these summary columns containing aggregated values: `COUNT_STAR`, `SUM_TIMER_WAIT`, `MIN_TIMER_WAIT`, `AVG_TIMER_WAIT`, and `MAX_TIMER_WAIT`. These columns are analogous to the columns of the same names in the wait event summary tables (see [Section 29.12.20.1, “Wait Event Summary Tables”](#)), except that the stage summary tables aggregate events from `events_stages_current` rather than `events_waits_current`.

The stage summary tables have these indexes:

- `events_stages_summary_by_account_by_event_name`:
  - Primary key on (`USER`, `HOST`, `EVENT_NAME`)
- `events_stages_summary_by_host_by_event_name`:
  - Primary key on (`HOST`, `EVENT_NAME`)
- `events_stages_summary_by_thread_by_event_name`:
  - Primary key on (`THREAD_ID`, `EVENT_NAME`)
- `events_stages_summary_by_user_by_event_name`:
  - Primary key on (`USER`, `EVENT_NAME`)
- `events_stages_summary_global_by_event_name`:
  - Primary key on (`EVENT_NAME`)

`TRUNCATE TABLE` is permitted for stage summary tables. It has these effects:

- For summary tables not aggregated by account, host, or user, truncation resets the summary columns to zero rather than removing rows.
- For summary tables aggregated by account, host, or user, truncation removes rows for accounts, hosts, or users with no connections, and resets the summary columns to zero for the remaining rows.

In addition, each stage summary table that is aggregated by account, host, user, or thread is implicitly truncated by truncation of the connection table on which it depends, or truncation of

`events_stages_summary_global_by_event_name`. For details, see [Section 29.12.8, “Performance Schema Connection Tables”](#).

### 29.12.20.3 Statement Summary Tables

The Performance Schema maintains tables for collecting current and recent statement events, and aggregates that information in summary tables. [Section 29.12.6, “Performance Schema Statement Event Tables”](#) describes the events on which statement summaries are based. See that discussion for information about the content of statement events, the current and historical statement event tables, and how to control statement event collection, which is partially disabled by default.

Example statement event summary information:

```
mysql> SELECT *
 FROM performance_schema.events_statements_summary_global_by_event_name\G

 1. row ****
EVENT_NAME: statement/sql/select
COUNT_STAR: 54
SUM_TIMER_WAIT: 38860400000
MIN_TIMER_WAIT: 52400000
AVG_TIMER_WAIT: 719600000
MAX_TIMER_WAIT: 12631800000
SUM_LOCK_TIME: 88000000
SUM_ERRORS: 0
SUM_WARNINGS: 0
SUM_ROWS_AFFECTED: 0
SUM_ROWS_SENT: 60
SUM_ROWS_EXAMINED: 120
SUM_CREATED_TMP_DISK_TABLES: 0
SUM_CREATED_TMP_TABLES: 21
SUM_SELECT_FULL_JOIN: 16
SUM_SELECT_FULL_RANGE_JOIN: 0
SUM_SELECT_RANGE: 0
SUM_SELECT_RANGE_CHECK: 0
SUM_SELECT_SCAN: 41
SUM_SORT_MERGE_PASSES: 0
SUM_SORT_RANGE: 0
SUM_SORT_ROWS: 0
SUM_SORT_SCAN: 0

```

Each statement summary table has one or more grouping columns to indicate how the table aggregates events. Event names refer to names of event instruments in the `setup_instruments` table:

- `events_statements_summary_by_account_by_event_name` has `EVENT_NAME`, `USER`, and `HOST` columns. Each row summarizes events for a given account (user and host combination) and event name.
- `events_statements_summary_by_digest` has `SCHEMA_NAME` and `DIGEST` columns. Each row summarizes events per schema and digest value. (The `DIGEST_TEXT` column contains the corresponding normalized statement digest text, but is neither a grouping nor a summary column. The `QUERY_SAMPLE_TEXT`, `QUERY_SAMPLE_SEEN`, and `QUERY_SAMPLE_TIMER_WAIT` columns also are neither grouping nor summary columns; they support statement sampling.)

The maximum number of rows in the table is autosized at server startup. To set this maximum explicitly, set the `performance_schema_digests_size` system variable at server startup.

- `events_statements_summary_by_host_by_event_name` has `EVENT_NAME` and `HOST` columns. Each row summarizes events for a given host and event name.

- `events_statements_summary_by_program` has `OBJECT_TYPE`, `OBJECT_SCHEMA`, and `OBJECT_NAME` columns. Each row summarizes events for a given stored program (stored procedure or function, trigger, or event).
- `events_statements_summary_by_thread_by_event_name` has `THREAD_ID` and `EVENT_NAME` columns. Each row summarizes events for a given thread and event name.
- `events_statements_summary_by_user_by_event_name` has `EVENT_NAME` and `USER` columns. Each row summarizes events for a given user and event name.
- `events_statements_summary_global_by_event_name` has an `EVENT_NAME` column. Each row summarizes events for a given event name.
- `prepared_statements_instances` has an `OBJECT_INSTANCE_BEGIN` column. Each row summarizes events for a given prepared statement.

Each statement summary table has these summary columns containing aggregated values (with exceptions as noted):

- `COUNT_STAR`, `SUM_TIMER_WAIT`, `MIN_TIMER_WAIT`, `AVG_TIMER_WAIT`, `MAX_TIMER_WAIT`

These columns are analogous to the columns of the same names in the wait event summary tables (see [Section 29.12.20.1, “Wait Event Summary Tables”](#)), except that the statement summary tables aggregate events from `events_statements_current` rather than `events_waits_current`.

The `prepared_statements_instances` table does not have these columns.

- `SUM_xxx`

The aggregate of the corresponding `xxx` column in the `events_statements_current` table. For example, the `SUM_LOCK_TIME` and `SUM_ERRORS` columns in statement summary tables are the aggregates of the `LOCK_TIME` and `ERRORS` columns in `events_statements_current` table.

- `MAX_CONTROLLED_MEMORY`

Reports the maximum amount of controlled memory used by a statement during execution.

- `MAX_TOTAL_MEMORY`

Reports the maximum amount of memory used by a statement during execution.

- `COUNT_SECONDARY`

The number of times a query was processed on the `SECONDARY` engine. For use with MySQL HeatWave Service and MySQL HeatWave, where the `PRIMARY` engine is InnoDB and the `SECONDARY` engine is MySQL HeatWave ([RAPID](#)). For MySQL Community Edition Server, MySQL Enterprise Edition Server (on-premise), and MySQL HeatWave Service without MySQL HeatWave, queries are always processed on the `PRIMARY` engine, which means the value is always 0 on these MySQL Servers.

The `events_statements_summary_by_digest` table has these additional summary columns:

- `FIRST_SEEN`, `LAST_SEEN`

Timestamps indicating when statements with the given digest value were first seen and most recently seen.

- `QUANTILE_95`: The 95th percentile of the statement latency, in picoseconds. This percentile is a high estimate, computed from the histogram data collected. In other words, for a given digest, 95% of the statements measured have a latency lower than `QUANTILE_95`.

For access to the histogram data, use the tables described in [Section 29.12.20.4, “Statement Histogram Summary Tables”](#).

- `QUANTILE_99`: Similar to `QUANTILE_95`, but for the 99th percentile.
- `QUANTILE_999`: Similar to `QUANTILE_95`, but for the 99.9th percentile.

The `events_statements_summary_by_digest` table contains the following columns. These are neither grouping nor summary columns; they support statement sampling:

- `QUERY_SAMPLE_TEXT`

A sample SQL statement that produces the digest value in the row. This column enables applications to access, for a given digest value, a statement actually seen by the server that produces that digest. One use for this might be to run `EXPLAIN` on the statement to examine the execution plan for a representative statement associated with a frequently occurring digest.

When the `QUERY_SAMPLE_TEXT` column is assigned a value, the `QUERY_SAMPLE_SEEN` and `QUERY_SAMPLE_TIMER_WAIT` columns are assigned values as well.

The maximum space available for statement display is 1024 bytes by default. To change this value, set the `performance_schema_max_sql_text_length` system variable at server startup. (Changing this value affects columns in other Performance Schema tables as well. See [Section 29.10, “Performance Schema Statement Digests and Sampling”](#).)

For information about statement sampling, see [Section 29.10, “Performance Schema Statement Digests and Sampling”](#).

- `QUERY_SAMPLE_SEEN`

A timestamp indicating when the statement in the `QUERY_SAMPLE_TEXT` column was seen.

- `QUERY_SAMPLE_TIMER_WAIT`

The wait time for the sample statement in the `QUERY_SAMPLE_TEXT` column.

The `events_statements_summary_by_program` table has these additional summary columns:

- `COUNT_STATEMENTS`, `SUM_STATEMENTS_WAIT`, `MIN_STATEMENTS_WAIT`, `AVG_STATEMENTS_WAIT`, `MAX_STATEMENTS_WAIT`

Statistics about nested statements invoked during stored program execution.

The `prepared_statements_instances` table has these additional summary columns:

- `COUNT_EXECUTE`, `SUM_TIMER_EXECUTE`, `MIN_TIMER_EXECUTE`, `AVG_TIMER_EXECUTE`, `MAX_TIMER_EXECUTE`

Aggregated statistics for executions of the prepared statement.

The statement summary tables have these indexes:

- `events_transactions_summary_by_account_by_event_name`:
  - Primary key on (`USER`, `HOST`, `EVENT_NAME`)
- `events_statements_summary_by_digest`:
  - Primary key on (`SCHEMA_NAME`, `DIGEST`)
- `events_transactions_summary_by_host_by_event_name`:
  - Primary key on (`HOST`, `EVENT_NAME`)
- `events_statements_summary_by_program`:

- Primary key on (`OBJECT_TYPE`, `OBJECT_SCHEMA`, `OBJECT_NAME`)
- `events_statements_summary_by_thread_by_event_name`:
  - Primary key on (`THREAD_ID`, `EVENT_NAME`)
- `events_transactions_summary_by_user_by_event_name`:
  - Primary key on (`USER`, `EVENT_NAME`)
- `events_statements_summary_global_by_event_name`:
  - Primary key on (`EVENT_NAME`)

`TRUNCATE TABLE` is permitted for statement summary tables. It has these effects:

- For `events_statements_summary_by_digest`, it removes the rows.
- For other summary tables not aggregated by account, host, or user, truncation resets the summary columns to zero rather than removing rows.
- For other summary tables aggregated by account, host, or user, truncation removes rows for accounts, hosts, or users with no connections, and resets the summary columns to zero for the remaining rows.

In addition, each statement summary table that is aggregated by account, host, user, or thread is implicitly truncated by truncation of the connection table on which it depends, or truncation of `events_statements_summary_global_by_event_name`. For details, see [Section 29.12.8, “Performance Schema Connection Tables”](#).

In addition, truncating `events_statements_summary_by_digest` implicitly truncates `events_statements_histogram_by_digest`, and truncating `events_statements_summary_global_by_event_name` implicitly truncates `events_statements_histogram_global`.

## Statement Digest Aggregation Rules

If the `statements_digest` consumer is enabled, aggregation into `events_statements_summary_by_digest` occurs as follows when a statement completes. Aggregation is based on the `DIGEST` value computed for the statement.

- If a `events_statements_summary_by_digest` row already exists with the digest value for the statement that just completed, statistics for the statement are aggregated to that row. The `LAST_SEEN` column is updated to the current time.
- If no row has the digest value for the statement that just completed, and the table is not full, a new row is created for the statement. The `FIRST_SEEN` and `LAST_SEEN` columns are initialized with the current time.
- If no row has the statement digest value for the statement that just completed, and the table is full, the statistics for the statement that just completed are added to a special “catch-all” row with `DIGEST = NULL`, which is created if necessary. If the row is created, the `FIRST_SEEN` and `LAST_SEEN` columns are initialized with the current time. Otherwise, the `LAST_SEEN` column is updated with the current time.

The row with `DIGEST = NULL` is maintained because Performance Schema tables have a maximum size due to memory constraints. The `DIGEST = NULL` row permits digests that do not match other rows to be counted even if the summary table is full, using a common “other” bucket. This row helps you estimate whether the digest summary is representative:

- A `DIGEST = NULL` row that has a `COUNT_STAR` value that represents 5% of all digests shows that the digest summary table is very representative; the other rows cover 95% of the statements seen.

- A `DIGEST = NULL` row that has a `COUNT_STAR` value that represents 50% of all digests shows that the digest summary table is not very representative; the other rows cover only half the statements seen. Most likely the DBA should increase the maximum table size so that more of the rows counted in the `DIGEST = NULL` row would be counted using more specific rows instead. By default, the table is autosized, but if this size is too small, set the `performance_schema_digests_size` system variable to a larger value at server startup.

## Stored Program Instrumentation Behavior

For stored program types for which instrumentation is enabled in the `setup_objects` table, `events_statements_summary_by_program` maintains statistics for stored programs as follows:

- A row is added for an object when it is first used in the server.
- The row for an object is removed when the object is dropped.
- Statistics are aggregated in the row for an object as it executes.

See also [Section 29.4.3, “Event Pre-Filtering”](#).

### 29.12.20.4 Statement Histogram Summary Tables

The Performance Schema maintains statement event summary tables that contain information about minimum, maximum, and average statement latency (see [Section 29.12.20.3, “Statement Summary Tables”](#)). Those tables permit high-level assessment of system performance. To permit assessment at a more fine-grained level, the Performance Schema also collects histogram data for statement latencies. These histograms provide additional insight into latency distributions.

[Section 29.12.6, “Performance Schema Statement Event Tables”](#) describes the events on which statement summaries are based. See that discussion for information about the content of statement events, the current and historical statement event tables, and how to control statement event collection, which is partially disabled by default.

Example statement histogram information:

```
mysql> SELECT *
 FROM performance_schema.events_statements_histogram_by_digest
 WHERE SCHEMA_NAME = 'mydb' AND DIGEST = 'bb3f69453119b2d7b3ae40673a9d4c7c'
 AND COUNT_BUCKET > 0 ORDER BY BUCKET_NUMBER\G

1. row ****
 SCHEMA_NAME: mydb
 DIGEST: bb3f69453119b2d7b3ae40673a9d4c7c
 BUCKET_NUMBER: 42
 BUCKET_TIMER_LOW: 66069344
 BUCKET_TIMER_HIGH: 69183097
 COUNT_BUCKET: 1
COUNT_BUCKET_AND_LOWER: 1
 BUCKET_QUANTILE: 0.058824

2. row ****
 SCHEMA_NAME: mydb
 DIGEST: bb3f69453119b2d7b3ae40673a9d4c7c
 BUCKET_NUMBER: 43
 BUCKET_TIMER_LOW: 69183097
 BUCKET_TIMER_HIGH: 72443596
 COUNT_BUCKET: 1
COUNT_BUCKET_AND_LOWER: 2
 BUCKET_QUANTILE: 0.117647

3. row ****
 SCHEMA_NAME: mydb
 DIGEST: bb3f69453119b2d7b3ae40673a9d4c7c
 BUCKET_NUMBER: 44
 BUCKET_TIMER_LOW: 72443596
 BUCKET_TIMER_HIGH: 75857757
 COUNT_BUCKET: 2
COUNT_BUCKET_AND_LOWER: 4
 BUCKET_QUANTILE: 0.235294

4. row ****
```

```

SCHEMA_NAME: mydb
DIGEST: bb3f69453119b2d7b3ae40673a9d4c7c
BUCKET_NUMBER: 45
BUCKET_TIMER_LOW: 75857757
BUCKET_TIMER_HIGH: 79432823
COUNT_BUCKET: 6
COUNT_BUCKET_AND_LOWER: 10
BUCKET_QUANTILE: 0.625000
...

```

For example, in row 3, these values indicate that 23.52% of queries run in under 75.86 microseconds:

```

BUCKET_TIMER_HIGH: 75857757
BUCKET_QUANTILE: 0.235294

```

In row 4, these values indicate that 62.50% of queries run in under 79.44 microseconds:

```

BUCKET_TIMER_HIGH: 79432823
BUCKET_QUANTILE: 0.625000

```

Each statement histogram summary table has one or more grouping columns to indicate how the table aggregates events:

- `events_statements_histogram_by_digest` has `SCHEMA_NAME`, `DIGEST`, and `BUCKET_NUMBER` columns:
  - The `SCHEMA_NAME` and `DIGEST` columns identify a statement digest row in the `events_statements_summary_by_digest` table.
  - The `events_statements_histogram_by_digest` rows with the same `SCHEMA_NAME` and `DIGEST` values comprise the histogram for that schema/digest combination.
  - Within a given histogram, the `BUCKET_NUMBER` column indicates the bucket number.
- `events_statements_histogram_global` has a `BUCKET_NUMBER` column. This table summarizes latencies globally across schema name and digest values, using a single histogram. The `BUCKET_NUMBER` column indicates the bucket number within this global histogram.

A histogram consists of  $N$  buckets, where each row represents one bucket, with the bucket number indicated by the `BUCKET_NUMBER` column. Bucket numbers begin with 0.

Each statement histogram summary table has these summary columns containing aggregated values:

- `BUCKET_TIMER_LOW`, `BUCKET_TIMER_HIGH`

A bucket counts statements that have a latency, in picoseconds, measured between `BUCKET_TIMER_LOW` and `BUCKET_TIMER_HIGH`:

- The value of `BUCKET_TIMER_LOW` for the first bucket (`BUCKET_NUMBER = 0`) is 0.
- The value of `BUCKET_TIMER_LOW` for a bucket (`BUCKET_NUMBER = k`) is the same as `BUCKET_TIMER_HIGH` for the previous bucket (`BUCKET_NUMBER = k-1`)
- The last bucket is a catchall for statements that have a latency exceeding previous buckets in the histogram.

- `COUNT_BUCKET`

The number of statements measured with a latency in the interval from `BUCKET_TIMER_LOW` up to but not including `BUCKET_TIMER_HIGH`.

- `COUNT_BUCKET_AND_LOWER`

The number of statements measured with a latency in the interval from 0 up to but not including `BUCKET_TIMER_HIGH`.

- `BUCKET_QUANTILE`

The proportion of statements that fall into this or a lower bucket. This proportion corresponds by definition to `COUNT_BUCKET_AND_LOWER / SUM(COUNT_BUCKET)` and is displayed as a convenience column.

The statement histogram summary tables have these indexes:

- `events_statements_histogram_by_digest`:
  - Unique index on (`SCHEMA_NAME`, `DIGEST`, `BUCKET_NUMBER`)
- `events_statements_histogram_global`:
  - Primary key on (`BUCKET_NUMBER`)

`TRUNCATE TABLE` is permitted for statement histogram summary tables. Truncation sets the `COUNT_BUCKET` and `COUNT_BUCKET_AND_LOWER` columns to 0.

In addition, truncating `events_statements_summary_by_digest` implicitly truncates `events_statements_histogram_by_digest`, and truncating `events_statements_summary_global_by_event_name` implicitly truncates `events_statements_histogram_global`.

## 29.12.20.5 Transaction Summary Tables

The Performance Schema maintains tables for collecting current and recent transaction events, and aggregates that information in summary tables. [Section 29.12.7, “Performance Schema Transaction Tables”](#) describes the events on which transaction summaries are based. See that discussion for information about the content of transaction events, the current and historical transaction event tables, and how to control transaction event collection, which is disabled by default.

Example transaction event summary information:

```
mysql> SELECT *
 FROM performance_schema.events_transactions_summary_global_by_event_name
 LIMIT 1\G

 1. row *****
EVENT_NAME: transaction
COUNT_STAR: 5
SUM_TIMER_WAIT: 19550092000
MIN_TIMER_WAIT: 2954148000
AVG_TIMER_WAIT: 3910018000
MAX_TIMER_WAIT: 5486275000
COUNT_READ_WRITE: 5
SUM_TIMER_READ_WRITE: 19550092000
MIN_TIMER_READ_WRITE: 2954148000
AVG_TIMER_READ_WRITE: 3910018000
MAX_TIMER_READ_WRITE: 5486275000
COUNT_READ_ONLY: 0
SUM_TIMER_READ_ONLY: 0
MIN_TIMER_READ_ONLY: 0
AVG_TIMER_READ_ONLY: 0
MAX_TIMER_READ_ONLY: 0
```

Each transaction summary table has one or more grouping columns to indicate how the table aggregates events. Event names refer to names of event instruments in the `setup_instruments` table:

- `events_transactions_summary_by_account_by_event_name` has `USER`, `HOST`, and `EVENT_NAME` columns. Each row summarizes events for a given account (user and host combination) and event name.
- `events_transactions_summary_by_host_by_event_name` has `HOST` and `EVENT_NAME` columns. Each row summarizes events for a given host and event name.

- `events_transactions_summary_by_thread_by_event_name` has `THREAD_ID` and `EVENT_NAME` columns. Each row summarizes events for a given thread and event name.
- `events_transactions_summary_by_user_by_event_name` has `USER` and `EVENT_NAME` columns. Each row summarizes events for a given user and event name.
- `events_transactions_summary_global_by_event_name` has an `EVENT_NAME` column. Each row summarizes events for a given event name.

Each transaction summary table has these summary columns containing aggregated values:

- `COUNT_STAR`, `SUM_TIMER_WAIT`, `MIN_TIMER_WAIT`, `AVG_TIMER_WAIT`, `MAX_TIMER_WAIT`

These columns are analogous to the columns of the same names in the wait event summary tables (see [Section 29.12.20.1, “Wait Event Summary Tables”](#)), except that the transaction summary tables aggregate events from `events_transactions_current` rather than `events_waits_current`. These columns summarize read-write and read-only transactions.

- `COUNT_READ_WRITE`, `SUM_TIMER_READ_WRITE`, `MIN_TIMER_READ_WRITE`,  
`AVG_TIMER_READ_WRITE`, `MAX_TIMER_READ_WRITE`

These are similar to the `COUNT_STAR` and `xxx_TIMER_WAIT` columns, but summarize read-write transactions only. The transaction access mode specifies whether transactions operate in read/write or read-only mode.

- `COUNT_READ_ONLY`, `SUM_TIMER_READ_ONLY`, `MIN_TIMER_READ_ONLY`,  
`AVG_TIMER_READ_ONLY`, `MAX_TIMER_READ_ONLY`

These are similar to the `COUNT_STAR` and `xxx_TIMER_WAIT` columns, but summarize read-only transactions only. The transaction access mode specifies whether transactions operate in read/write or read-only mode.

The transaction summary tables have these indexes:

- `events_transactions_summary_by_account_by_event_name`:
  - Primary key on (`USER`, `HOST`, `EVENT_NAME`)
- `events_transactions_summary_by_host_by_event_name`:
  - Primary key on (`HOST`, `EVENT_NAME`)
- `events_transactions_summary_by_thread_by_event_name`:
  - Primary key on (`THREAD_ID`, `EVENT_NAME`)
- `events_transactions_summary_by_user_by_event_name`:
  - Primary key on (`USER`, `EVENT_NAME`)
- `events_transactions_summary_global_by_event_name`:
  - Primary key on (`EVENT_NAME`)

`TRUNCATE TABLE` is permitted for transaction summary tables. It has these effects:

- For summary tables not aggregated by account, host, or user, truncation resets the summary columns to zero rather than removing rows.
- For summary tables aggregated by account, host, or user, truncation removes rows for accounts, hosts, or users with no connections, and resets the summary columns to zero for the remaining rows.

In addition, each transaction summary table that is aggregated by account, host, user, or thread is implicitly truncated by truncation of the connection table on which it depends, or truncation of

`events_transactions_summary_global_by_event_name`. For details, see [Section 29.12.8, “Performance Schema Connection Tables”](#).

## Transaction Aggregation Rules

Transaction event collection occurs without regard to isolation level, access mode, or autocommit mode.

Transaction event collection occurs for all non-aborted transactions initiated by the server, including empty transactions.

Read-write transactions are generally more resource intensive than read-only transactions, therefore transaction summary tables include separate aggregate columns for read-write and read-only transactions.

Resource requirements may also vary with transaction isolation level. However, presuming that only one isolation level would be used per server, aggregation by isolation level is not provided.

## 29.12.20.6 Object Wait Summary Table

The Performance Schema maintains the `objects_summary_global_by_type` table for aggregating object wait events.

Example object wait event summary information:

```
mysql> SELECT * FROM performance_schema.objects_summary_global_by_type\G
...
***** 3. row *****
 OBJECT_TYPE: TABLE
 OBJECT_SCHEMA: test
 OBJECT_NAME: t
 COUNT_STAR: 3
SUM_TIMER_WAIT: 263126976
MIN_TIMER_WAIT: 1522272
AVG_TIMER_WAIT: 87708678
MAX_TIMER_WAIT: 258428280
...
***** 10. row *****
 OBJECT_TYPE: TABLE
 OBJECT_SCHEMA: mysql
 OBJECT_NAME: user
 COUNT_STAR: 14
SUM_TIMER_WAIT: 365567592
MIN_TIMER_WAIT: 1141704
AVG_TIMER_WAIT: 26111769
MAX_TIMER_WAIT: 334783032
...
```

The `objects_summary_global_by_type` table has these grouping columns to indicate how the table aggregates events: `OBJECT_TYPE`, `OBJECT_SCHEMA`, and `OBJECT_NAME`. Each row summarizes events for the given object.

`objects_summary_global_by_type` has the same summary columns as the `events_waits_summary_by_xxx` tables. See [Section 29.12.20.1, “Wait Event Summary Tables”](#).

The `objects_summary_global_by_type` table has these indexes:

- Primary key on (`OBJECT_TYPE`, `OBJECT_SCHEMA`, `OBJECT_NAME`)

`TRUNCATE TABLE` is permitted for the object summary table. It resets the summary columns to zero rather than removing rows.

## 29.12.20.7 File I/O Summary Tables

The Performance Schema maintains file I/O summary tables that aggregate information about I/O operations.

Example file I/O event summary information:

```
mysql> SELECT * FROM performance_schema.file_summary_by_event_name\G
...
***** 2. row ****
EVENT_NAME: wait/io/file/sql/binlog
COUNT_STAR: 31
SUM_TIMER_WAIT: 8243784888
MIN_TIMER_WAIT: 0
AVG_TIMER_WAIT: 265928484
MAX_TIMER_WAIT: 6490658832
...
mysql> SELECT * FROM performance_schema.file_summary_by_instance\G
...
***** 2. row ****
FILE_NAME: /var/mysql/share/english/errmsg.sys
EVENT_NAME: wait/io/file/sql/ERRMSG
EVENT_NAME: wait/io/file/sql/ERRMSG
OBJECT_INSTANCE_BEGIN: 4686193384
COUNT_STAR: 5
SUM_TIMER_WAIT: 13990154448
MIN_TIMER_WAIT: 26349624
AVG_TIMER_WAIT: 2798030607
MAX_TIMER_WAIT: 8150662536
...
```

Each file I/O summary table has one or more grouping columns to indicate how the table aggregates events. Event names refer to names of event instruments in the `setup_instruments` table:

- `file_summary_by_event_name` has an `EVENT_NAME` column. Each row summarizes events for a given event name.
- `file_summary_by_instance` has `FILE_NAME`, `EVENT_NAME`, and `OBJECT_INSTANCE_BEGIN` columns. Each row summarizes events for a given file and event name.

Each file I/O summary table has the following summary columns containing aggregated values. Some columns are more general and have values that are the same as the sum of the values of more fine-grained columns. In this way, aggregations at higher levels are available directly without the need for user-defined views that sum lower-level columns.

- `COUNT_STAR`, `SUM_TIMER_WAIT`, `MIN_TIMER_WAIT`, `AVG_TIMER_WAIT`, `MAX_TIMER_WAIT`

These columns aggregate all I/O operations.

- `COUNT_READ`, `SUM_TIMER_READ`, `MIN_TIMER_READ`, `AVG_TIMER_READ`, `MAX_TIMER_READ`, `SUM_NUMBER_OF_BYTES_READ`

These columns aggregate all read operations, including `FGETS`, `FGETC`, `FREAD`, and `READ`.

- `COUNT_WRITE`, `SUM_TIMER_WRITE`, `MIN_TIMER_WRITE`, `AVG_TIMER_WRITE`, `MAX_TIMER_WRITE`, `SUM_NUMBER_OF_BYTES_WRITE`

These columns aggregate all write operations, including `FPUTS`, `FPUTC`, `FPRINTF`, `VPRINTF`, `FWRITE`, and `PWRITE`.

- `COUNT_MISC`, `SUM_TIMER_MISC`, `MIN_TIMER_MISC`, `AVG_TIMER_MISC`, `MAX_TIMER_MISC`

These columns aggregate all other I/O operations, including `CREATE`, `DELETE`, `OPEN`, `CLOSE`, `STREAM_OPEN`, `STREAM_CLOSE`, `SEEK`, `TELL`, `FLUSH`, `STAT`, `FSTAT`, `CHSIZE`, `RENAME`, and `SYNC`. There are no byte counts for these operations.

The file I/O summary tables have these indexes:

- `file_summary_by_event_name`:
  - Primary key on (`EVENT_NAME`)

- `file_summary_by_instance`:
  - Primary key on (`OBJECT_INSTANCE_BEGIN`)
  - Index on (`FILE_NAME`)
  - Index on (`EVENT_NAME`)

`TRUNCATE TABLE` is permitted for file I/O summary tables. It resets the summary columns to zero rather than removing rows.

The MySQL server uses several techniques to avoid I/O operations by caching information read from files, so it is possible that statements you might expect to result in I/O events do not do so. You may be able to ensure that I/O does occur by flushing caches or restarting the server to reset its state.

### 29.12.20.8 Table I/O and Lock Wait Summary Tables

The following sections describe the table I/O and lock wait summary tables:

- `table_io_waits_summary_by_index_usage`: Table I/O waits per index
- `table_io_waits_summary_by_table`: Table I/O waits per table
- `table_lock_waits_summary_by_table`: Table lock waits per table

#### The `table_io_waits_summary_by_table` Table

The `table_io_waits_summary_by_table` table aggregates all table I/O wait events, as generated by the `wait/io/table/sql/handler` instrument. The grouping is by table.

The `table_io_waits_summary_by_table` table has these grouping columns to indicate how the table aggregates events: `OBJECT_TYPE`, `OBJECT_SCHEMA`, and `OBJECT_NAME`. These columns have the same meaning as in the `events_waits_current` table. They identify the table to which the row applies.

`table_io_waits_summary_by_table` has the following summary columns containing aggregated values. As indicated in the column descriptions, some columns are more general and have values that are the same as the sum of the values of more fine-grained columns. For example, columns that aggregate all writes hold the sum of the corresponding columns that aggregate inserts, updates, and deletes. In this way, aggregations at higher levels are available directly without the need for user-defined views that sum lower-level columns.

- `COUNT_STAR`, `SUM_TIMER_WAIT`, `MIN_TIMER_WAIT`, `AVG_TIMER_WAIT`, `MAX_TIMER_WAIT`

These columns aggregate all I/O operations. They are the same as the sum of the corresponding `xxx_READ` and `xxx_WRITE` columns.

- `COUNT_READ`, `SUM_TIMER_READ`, `MIN_TIMER_READ`, `AVG_TIMER_READ`, `MAX_TIMER_READ`

These columns aggregate all read operations. They are the same as the sum of the corresponding `xxx_FETCH` columns.

- `COUNT_WRITE`, `SUM_TIMER_WRITE`, `MIN_TIMER_WRITE`, `AVG_TIMER_WRITE`, `MAX_TIMER_WRITE`

These columns aggregate all write operations. They are the same as the sum of the corresponding `xxx_INSERT`, `xxx_UPDATE`, and `xxx_DELETE` columns.

- `COUNT_FETCH`, `SUM_TIMER_FETCH`, `MIN_TIMER_FETCH`, `AVG_TIMER_FETCH`, `MAX_TIMER_FETCH`

These columns aggregate all fetch operations.

- COUNT\_INSERT, SUM\_TIMER\_INSERT, MIN\_TIMER\_INSERT, AVG\_TIMER\_INSERT, MAX\_TIMER\_INSERT

These columns aggregate all insert operations.

- COUNT\_UPDATE, SUM\_TIMER\_UPDATE, MIN\_TIMER\_UPDATE, AVG\_TIMER\_UPDATE, MAX\_TIMER\_UPDATE

These columns aggregate all update operations.

- COUNT\_DELETE, SUM\_TIMER\_DELETE, MIN\_TIMER\_DELETE, AVG\_TIMER\_DELETE, MAX\_TIMER\_DELETE

These columns aggregate all delete operations.

The `table_io_waits_summary_by_table` table has these indexes:

- Unique index on (`OBJECT_TYPE`, `OBJECT_SCHEMA`, `OBJECT_NAME`)

`TRUNCATE TABLE` is permitted for table I/O summary tables. It resets the summary columns to zero rather than removing rows. Truncating this table also truncates the `table_io_waits_summary_by_index_usage` table.

## The `table_io_waits_summary_by_index_usage` Table

The `table_io_waits_summary_by_index_usage` table aggregates all table index I/O wait events, as generated by the `wait/io/table/sql/handler` instrument. The grouping is by table index.

The columns of `table_io_waits_summary_by_index_usage` are nearly identical to `table_io_waits_summary_by_table`. The only difference is the additional group column, `INDEX_NAME`, which corresponds to the name of the index that was used when the table I/O wait event was recorded:

- A value of `PRIMARY` indicates that table I/O used the primary index.
- A value of `NULL` means that table I/O used no index.
- Inserts are counted against `INDEX_NAME = NULL`.

The `table_io_waits_summary_by_index_usage` table has these indexes:

- Unique index on (`OBJECT_TYPE`, `OBJECT_SCHEMA`, `OBJECT_NAME`, `INDEX_NAME`)

`TRUNCATE TABLE` is permitted for table I/O summary tables. It resets the summary columns to zero rather than removing rows. This table is also truncated by truncation of the `table_io_waits_summary_by_table` table. A DDL operation that changes the index structure of a table may cause the per-index statistics to be reset.

## The `table_lock_waits_summary_by_table` Table

The `table_lock_waits_summary_by_table` table aggregates all table lock wait events, as generated by the `wait/lock/table/sql/handler` instrument. The grouping is by table.

This table contains information about internal and external locks:

- An internal lock corresponds to a lock in the SQL layer. This is currently implemented by a call to `thr_lock()`. In event rows, these locks are distinguished by the `OPERATION` column, which has one of these values:

```
read normal
read with shared locks
read high priority
```

```
read no insert
write allow write
write concurrent insert
write delayed
write low priority
write normal
```

- An external lock corresponds to a lock in the storage engine layer. This is currently implemented by a call to `handler::external_lock()`. In event rows, these locks are distinguished by the `OPERATION` column, which has one of these values:

```
read external
write external
```

The `table_lock_waits_summary_by_table` table has these grouping columns to indicate how the table aggregates events: `OBJECT_TYPE`, `OBJECT_SCHEMA`, and `OBJECT_NAME`. These columns have the same meaning as in the `events_waits_current` table. They identify the table to which the row applies.

`table_lock_waits_summary_by_table` has the following summary columns containing aggregated values. As indicated in the column descriptions, some columns are more general and have values that are the same as the sum of the values of more fine-grained columns. For example, columns that aggregate all locks hold the sum of the corresponding columns that aggregate read and write locks. In this way, aggregations at higher levels are available directly without the need for user-defined views that sum lower-level columns.

- `COUNT_STAR`, `SUM_TIMER_WAIT`, `MIN_TIMER_WAIT`, `AVG_TIMER_WAIT`, `MAX_TIMER_WAIT`

These columns aggregate all lock operations. They are the same as the sum of the corresponding `xxx_READ` and `xxx_WRITE` columns.

- `COUNT_READ`, `SUM_TIMER_READ`, `MIN_TIMER_READ`, `AVG_TIMER_READ`, `MAX_TIMER_READ`

These columns aggregate all read-lock operations. They are the same as the sum of the corresponding `xxx_READ_NORMAL`, `xxx_READ_WITH_SHARED_LOCKS`, `xxx_READ_HIGH_PRIORITY`, and `xxx_READ_NO_INSERT` columns.

- `COUNT_WRITE`, `SUM_TIMER_WRITE`, `MIN_TIMER_WRITE`, `AVG_TIMER_WRITE`, `MAX_TIMER_WRITE`

These columns aggregate all write-lock operations. They are the same as the sum of the corresponding `xxx_WRITE_ALLOW_WRITE`, `xxx_WRITE_CONCURRENT_INSERT`, `xxx_WRITE_LOW_PRIORITY`, and `xxx_WRITE_NORMAL` columns.

- `COUNT_READ_NORMAL`, `SUM_TIMER_READ_NORMAL`, `MIN_TIMER_READ_NORMAL`, `AVG_TIMER_READ_NORMAL`, `MAX_TIMER_READ_NORMAL`

These columns aggregate internal read locks.

- `COUNT_READ_WITH_SHARED_LOCKS`, `SUM_TIMER_READ_WITH_SHARED_LOCKS`, `MIN_TIMER_READ_WITH_SHARED_LOCKS`, `AVG_TIMER_READ_WITH_SHARED_LOCKS`, `MAX_TIMER_READ_WITH_SHARED_LOCKS`

These columns aggregate internal read locks.

- `COUNT_READ_HIGH_PRIORITY`, `SUM_TIMER_READ_HIGH_PRIORITY`, `MIN_TIMER_READ_HIGH_PRIORITY`, `AVG_TIMER_READ_HIGH_PRIORITY`, `MAX_TIMER_READ_HIGH_PRIORITY`

These columns aggregate internal read locks.

- `COUNT_READ_NO_INSERT`, `SUM_TIMER_READ_NO_INSERT`, `MIN_TIMER_READ_NO_INSERT`, `AVG_TIMER_READ_NO_INSERT`, `MAX_TIMER_READ_NO_INSERT`

These columns aggregate internal read locks.

- COUNT\_READ\_EXTERNAL, SUM\_TIMER\_READ\_EXTERNAL, MIN\_TIMER\_READ\_EXTERNAL, AVG\_TIMER\_READ\_EXTERNAL, MAX\_TIMER\_READ\_EXTERNAL

These columns aggregate external read locks.

- COUNT\_WRITE\_ALLOW\_WRITE, SUM\_TIMER\_WRITE\_ALLOW\_WRITE, MIN\_TIMER\_WRITE\_ALLOW\_WRITE, AVG\_TIMER\_WRITE\_ALLOW\_WRITE, MAX\_TIMER\_WRITE\_ALLOW\_WRITE

These columns aggregate internal write locks.

- COUNT\_WRITE\_CONCURRENT\_INSERT, SUM\_TIMER\_WRITE\_CONCURRENT\_INSERT, MIN\_TIMER\_WRITE\_CONCURRENT\_INSERT, AVG\_TIMER\_WRITE\_CONCURRENT\_INSERT, MAX\_TIMER\_WRITE\_CONCURRENT\_INSERT

These columns aggregate internal write locks.

- COUNT\_WRITE\_LOW\_PRIORITY, SUM\_TIMER\_WRITE\_LOW\_PRIORITY, MIN\_TIMER\_WRITE\_LOW\_PRIORITY, AVG\_TIMER\_WRITE\_LOW\_PRIORITY, MAX\_TIMER\_WRITE\_LOW\_PRIORITY

These columns aggregate internal write locks.

- COUNT\_WRITE\_NORMAL, SUM\_TIMER\_WRITE\_NORMAL, MIN\_TIMER\_WRITE\_NORMAL, AVG\_TIMER\_WRITE\_NORMAL, MAX\_TIMER\_WRITE\_NORMAL

These columns aggregate internal write locks.

- COUNT\_WRITE\_EXTERNAL, SUM\_TIMER\_WRITE\_EXTERNAL, MIN\_TIMER\_WRITE\_EXTERNAL, AVG\_TIMER\_WRITE\_EXTERNAL, MAX\_TIMER\_WRITE\_EXTERNAL

These columns aggregate external write locks.

The `table_lock_waits_summary_by_table` table has these indexes:

- Unique index on (`OBJECT_TYPE`, `OBJECT_SCHEMA`, `OBJECT_NAME`)

`TRUNCATE TABLE` is permitted for table lock summary tables. It resets the summary columns to zero rather than removing rows.

## 29.12.20.9 Socket Summary Tables

These socket summary tables aggregate timer and byte count information for socket operations:

- `socket_summary_by_event_name`: Aggregate timer and byte count statistics generated by the `wait/io/socket/*` instruments for all socket I/O operations, per socket instrument.
- `socket_summary_by_instance`: Aggregate timer and byte count statistics generated by the `wait/io/socket/*` instruments for all socket I/O operations, per socket instance. When a connection terminates, the row in `socket_summary_by_instance` corresponding to it is deleted.

The socket summary tables do not aggregate waits generated by `idle` events while sockets are waiting for the next request from the client. For `idle` event aggregations, use the wait-event summary tables; see [Section 29.12.20.1, “Wait Event Summary Tables”](#).

Each socket summary table has one or more grouping columns to indicate how the table aggregates events. Event names refer to names of event instruments in the `setup_instruments` table:

- `socket_summary_by_event_name` has an `EVENT_NAME` column. Each row summarizes events for a given event name.

- `socket_summary_by_instance` has an `OBJECT_INSTANCE_BEGIN` column. Each row summarizes events for a given object.

Each socket summary table has these summary columns containing aggregated values:

- `COUNT_STAR, SUM_TIMER_WAIT, MIN_TIMER_WAIT, AVG_TIMER_WAIT, MAX_TIMER_WAIT`

These columns aggregate all operations.

- `COUNT_READ, SUM_TIMER_READ, MIN_TIMER_READ, AVG_TIMER_READ, MAX_TIMER_READ, SUM_NUMBER_OF_BYTES_READ`

These columns aggregate all receive operations (`RECV`, `RECVFROM`, and `RECVMSG`).

- `COUNT_WRITE, SUM_TIMER_WRITE, MIN_TIMER_WRITE, AVG_TIMER_WRITE, MAX_TIMER_WRITE, SUM_NUMBER_OF_BYTES_WRITE`

These columns aggregate all send operations (`SEND`, `SENDTO`, and `SENDMSG`).

- `COUNT_MISC, SUM_TIMER_MISC, MIN_TIMER_MISC, AVG_TIMER_MISC, MAX_TIMER_MISC`

These columns aggregate all other socket operations, such as `CONNECT`, `LISTEN`, `ACCEPT`, `CLOSE`, and `SHUTDOWN`. There are no byte counts for these operations.

The `socket_summary_by_instance` table also has an `EVENT_NAME` column that indicates the class of the socket: `client_connection`, `server_tcpip_socket`, `server_unix_socket`. This column can be grouped on to isolate, for example, client activity from that of the server listening sockets.

The socket summary tables have these indexes:

- `socket_summary_by_event_name`:

- Primary key on (`EVENT_NAME`)

- `socket_summary_by_instance`:

- Primary key on (`OBJECT_INSTANCE_BEGIN`)

- Index on (`EVENT_NAME`)

`TRUNCATE TABLE` is permitted for socket summary tables. Except for `events_statements_summary_by_digest`, it resets the summary columns to zero rather than removing rows.

## 29.12.20.10 Memory Summary Tables

The Performance Schema instruments memory usage and aggregates memory usage statistics, detailed by these factors:

- Type of memory used (various caches, internal buffers, and so forth)
- Thread, account, user, host indirectly performing the memory operation

The Performance Schema instruments the following aspects of memory use

- Memory sizes used
- Operation counts
- Low and high water marks

Memory sizes help to understand or tune the memory consumption of the server.

Operation counts help to understand or tune the overall pressure the server is putting on the memory allocator, which has an impact on performance. Allocating a single byte one million times is not the same as allocating one million bytes a single time; tracking both sizes and counts can expose the difference.

Low and high water marks are critical to detect workload spikes, overall workload stability, and possible memory leaks.

Memory summary tables do not contain timing information because memory events are not timed.

For information about collecting memory usage data, see [Memory Instrumentation Behavior](#).

Example memory event summary information:

```
mysql> SELECT *
 FROM performance_schema.memory_summary_global_by_event_name
 WHERE EVENT_NAME = 'memory/sql/TABLE'\G

 1. row ****
 EVENT_NAME: memory/sql/TABLE
 COUNT_ALLOC: 1381
 COUNT_FREE: 924
 SUM_NUMBER_OF_BYTES_ALLOC: 2059873
 SUM_NUMBER_OF_BYTES_FREE: 1407432
 LOW_COUNT_USED: 0
 CURRENT_COUNT_USED: 457
 HIGH_COUNT_USED: 461
 LOW_NUMBER_OF_BYTES_USED: 0
CURRENT_NUMBER_OF_BYTES_USED: 652441
 HIGH_NUMBER_OF_BYTES_USED: 669269
```

Each memory summary table has one or more grouping columns to indicate how the table aggregates events. Event names refer to names of event instruments in the `setup_instruments` table:

- `memory_summary_by_account_by_event_name` has `USER`, `HOST`, and `EVENT_NAME` columns. Each row summarizes events for a given account (user and host combination) and event name.
- `memory_summary_by_host_by_event_name` has `HOST` and `EVENT_NAME` columns. Each row summarizes events for a given host and event name.
- `memory_summary_by_thread_by_event_name` has `THREAD_ID` and `EVENT_NAME` columns. Each row summarizes events for a given thread and event name.
- `memory_summary_by_user_by_event_name` has `USER` and `EVENT_NAME` columns. Each row summarizes events for a given user and event name.
- `memory_summary_global_by_event_name` has an `EVENT_NAME` column. Each row summarizes events for a given event name.

Each memory summary table has these summary columns containing aggregated values:

- `COUNT_ALLOC`, `COUNT_FREE`

The aggregated numbers of calls to memory-allocation and memory-free functions.

- `SUM_NUMBER_OF_BYTES_ALLOC`, `SUM_NUMBER_OF_BYTES_FREE`

The aggregated sizes of allocated and freed memory blocks.

- `CURRENT_COUNT_USED`

The aggregated number of currently allocated blocks that have not been freed yet. This is a convenience column, equal to `COUNT_ALLOC - COUNT_FREE`.

- `CURRENT_NUMBER_OF_BYTES_USED`

The aggregated size of currently allocated memory blocks that have not been freed yet. This is a convenience column, equal to `SUM_NUMBER_OF_BYTES_ALLOC` – `SUM_NUMBER_OF_BYTES_FREE`.

- `LOW_COUNT_USED`, `HIGH_COUNT_USED`

The low and high water marks corresponding to the `CURRENT_COUNT_USED` column.

- `LOW_NUMBER_OF_BYTES_USED`, `HIGH_NUMBER_OF_BYTES_USED`

The low and high water marks corresponding to the `CURRENT_NUMBER_OF_BYTES_USED` column.

The memory summary tables have these indexes:

- `memory_summary_by_account_by_event_name`:
  - Primary key on (`USER`, `HOST`, `EVENT_NAME`)
- `memory_summary_by_host_by_event_name`:
  - Primary key on (`HOST`, `EVENT_NAME`)
- `memory_summary_by_thread_by_event_name`:
  - Primary key on (`THREAD_ID`, `EVENT_NAME`)
- `memory_summary_by_user_by_event_name`:
  - Primary key on (`USER`, `EVENT_NAME`)
- `memory_summary_global_by_event_name`:
  - Primary key on (`EVENT_NAME`)

`TRUNCATE TABLE` is permitted for memory summary tables. It has these effects:

- In general, truncation resets the baseline for statistics, but does not change the server state. That is, truncating a memory table does not free memory.
- `COUNT_ALLOC` and `COUNT_FREE` are reset to a new baseline, by reducing each counter by the same value.
- Likewise, `SUM_NUMBER_OF_BYTES_ALLOC` and `SUM_NUMBER_OF_BYTES_FREE` are reset to a new baseline.
- `LOW_COUNT_USED` and `HIGH_COUNT_USED` are reset to `CURRENT_COUNT_USED`.
- `LOW_NUMBER_OF_BYTES_USED` and `HIGH_NUMBER_OF_BYTES_USED` are reset to `CURRENT_NUMBER_OF_BYTES_USED`.

In addition, each memory summary table that is aggregated by account, host, user, or thread is implicitly truncated by truncation of the connection table on which it depends, or truncation of `memory_summary_global_by_event_name`. For details, see [Section 29.12.8, “Performance Schema Connection Tables”](#).

## Memory Instrumentation Behavior

Memory instruments are listed in the `setup_instruments` table and have names of the form `memory/code_area/instrument_name`. Memory instrumentation is enabled by default.

Instruments named with the prefix `memory/performance_schema/` expose how much memory is allocated for internal buffers in the Performance Schema itself. The `memory/performance_schema/`

instruments are built in, always enabled, and cannot be disabled at startup or runtime. Built-in memory instruments are displayed only in the `memory_summary_global_by_event_name` table.

To control memory instrumentation state at server startup, use lines like these in your `my.cnf` file:

- Enable:

```
[mysqld]
performance-schema-instrument='memory/%=ON'
```

- Disable:

```
[mysqld]
performance-schema-instrument='memory/%=OFF'
```

To control memory instrumentation state at runtime, update the `ENABLED` column of the relevant instruments in the `setup_instruments` table:

- Enable:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'YES'
WHERE NAME LIKE 'memory/%';
```

- Disable:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'NO'
WHERE NAME LIKE 'memory/%';
```

For memory instruments, the `TIMED` column in `setup_instruments` is ignored because memory operations are not timed.

When a thread in the server executes a memory allocation that has been instrumented, these rules apply:

- If the thread is not instrumented or the memory instrument is not enabled, the memory block allocated is not instrumented.
- Otherwise (that is, both the thread and the instrument are enabled), the memory block allocated is instrumented.

For deallocation, these rules apply:

- If a memory allocation operation was instrumented, the corresponding free operation is instrumented, regardless of the current instrument or thread enabled status.
- If a memory allocation operation was not instrumented, the corresponding free operation is not instrumented, regardless of the current instrument or thread enabled status.

For the per-thread statistics, the following rules apply.

When an instrumented memory block of size `N` is allocated, the Performance Schema makes these updates to memory summary table columns:

- `COUNT_ALLOC`: Increased by 1
- `CURRENT_COUNT_USED`: Increased by 1
- `HIGH_COUNT_USED`: Increased if `CURRENT_COUNT_USED` is a new maximum
- `SUM_NUMBER_OF_BYTES_ALLOC`: Increased by `N`
- `CURRENT_NUMBER_OF_BYTES_USED`: Increased by `N`

- `HIGH_NUMBER_OF_BYTES_USED`: Increased if `CURRENT_NUMBER_OF_BYTES_USED` is a new maximum

When an instrumented memory block is deallocated, the Performance Schema makes these updates to memory summary table columns:

- `COUNT_FREE`: Increased by 1
- `CURRENT_COUNT_USED`: Decreased by 1
- `LOW_COUNT_USED`: Decreased if `CURRENT_COUNT_USED` is a new minimum
- `SUM_NUMBER_OF_BYTES_FREE`: Increased by  $N$
- `CURRENT_NUMBER_OF_BYTES_USED`: Decreased by  $N$
- `LOW_NUMBER_OF_BYTES_USED`: Decreased if `CURRENT_NUMBER_OF_BYTES_USED` is a new minimum

For higher-level aggregates (global, by account, by user, by host), the same rules apply as expected for low and high water marks.

- `LOW_COUNT_USED` and `LOW_NUMBER_OF_BYTES_USED` are lower estimates. The value reported by the Performance Schema is guaranteed to be less than or equal to the lowest count or size of memory effectively used at runtime.
- `HIGH_COUNT_USED` and `HIGH_NUMBER_OF_BYTES_USED` are higher estimates. The value reported by the Performance Schema is guaranteed to be greater than or equal to the highest count or size of memory effectively used at runtime.

For lower estimates in summary tables other than `memory_summary_global_by_event_name`, it is possible for values to go negative if memory ownership is transferred between threads.

Here is an example of estimate computation; but note that estimate implementation is subject to change:

Thread 1 uses memory in the range from 1MB to 2MB during execution, as reported by the `LOW_NUMBER_OF_BYTES_USED` and `HIGH_NUMBER_OF_BYTES_USED` columns of the `memory_summary_by_thread_by_event_name` table.

Thread 2 uses memory in the range from 10MB to 12MB during execution, as reported likewise.

When these two threads belong to the same user account, the per-account summary estimates that this account used memory in the range from 11MB to 14MB. That is, the `LOW_NUMBER_OF_BYTES_USED` for the higher level aggregate is the sum of each `LOW_NUMBER_OF_BYTES_USED` (assuming the worst case). Likewise, the `HIGH_NUMBER_OF_BYTES_USED` for the higher level aggregate is the sum of each `HIGH_NUMBER_OF_BYTES_USED` (assuming the worst case).

11MB is a lower estimate that can occur only if both threads hit the low usage mark at the same time.

14MB is a higher estimate that can occur only if both threads hit the high usage mark at the same time.

The real memory usage for this account could have been in the range from 11.5MB to 13.5MB.

For capacity planning, reporting the worst case is actually the desired behavior, as it shows what can potentially happen when sessions are uncorrelated, which is typically the case.

## 29.12.20.11 Error Summary Tables

The Performance Schema maintains summary tables for aggregating statistical information about server errors (and warnings). For a list of server errors, see [Server Error Message Reference](#).

Collection of error information is controlled by the `error` instrument, which is enabled by default. Timing information is not collected.

Each error summary table has three columns that identify the error:

- `ERROR_NUMBER` is the numeric error value. The value is unique.
- `ERROR_NAME` is the symbolic error name corresponding to the `ERROR_NUMBER` value. The value is unique.
- `SQLSTATE` is the SQLSTATE value corresponding to the `ERROR_NUMBER` value. The value is not necessarily unique.

For example, if `ERROR_NUMBER` is 1050, `ERROR_NAME` is `ER_TABLE_EXISTS_ERROR` and `SQLSTATE` is `42S01`.

Example error event summary information:

```
mysql> SELECT *
 FROM performance_schema.events_errors_summary_global_by_error
 WHERE SUM_ERROR_RAISED <> 0\G

*** 1. row ****
 ERROR_NUMBER: 1064
 ERROR_NAME: ER_PARSE_ERROR
 SQL_STATE: 42000
 SUM_ERROR_RAISED: 1
 SUM_ERROR_HANDLED: 0
 FIRST_SEEN: 2016-06-28 07:34:02
 LAST_SEEN: 2016-06-28 07:34:02

*** 2. row ****
 ERROR_NUMBER: 1146
 ERROR_NAME: ER_NO_SUCH_TABLE
 SQL_STATE: 42S02
 SUM_ERROR_RAISED: 2
 SUM_ERROR_HANDLED: 0
 FIRST_SEEN: 2016-06-28 07:34:05
 LAST_SEEN: 2016-06-28 07:36:18

*** 3. row ****
 ERROR_NUMBER: 1317
 ERROR_NAME: ER_QUERY_INTERRUPTED
 SQL_STATE: 70100
 SUM_ERROR_RAISED: 1
 SUM_ERROR_HANDLED: 0
 FIRST_SEEN: 2016-06-28 11:01:49
 LAST_SEEN: 2016-06-28 11:01:49
```

Each error summary table has one or more grouping columns to indicate how the table aggregates errors:

- `events_errors_summary_by_account_by_error` has `USER`, `HOST`, and `ERROR_NUMBER` columns. Each row summarizes events for a given account (user and host combination) and error.
- `events_errors_summary_by_host_by_error` has `HOST` and `ERROR_NUMBER` columns. Each row summarizes events for a given host and error.
- `events_errors_summary_by_thread_by_error` has `THREAD_ID` and `ERROR_NUMBER` columns. Each row summarizes events for a given thread and error.
- `events_errors_summary_by_user_by_error` has `USER` and `ERROR_NUMBER` columns. Each row summarizes events for a given user and error.
- `events_errors_summary_global_by_error` has an `ERROR_NUMBER` column. Each row summarizes events for a given error.

Each error summary table has these summary columns containing aggregated values:

- `SUM_ERROR_RAISED`

This column aggregates the number of times the error occurred.

- `SUM_ERROR_HANDLED`

This column aggregates the number of times the error was handled by an SQL exception handler.

- `FIRST_SEEN`, `LAST_SEEN`

Timestamp indicating when the error was first seen and most recently seen.

A `NULL` row in each error summary table is used to aggregate statistics for all errors that lie out of range of the instrumented errors. For example, if MySQL Server errors lie in the range from `M` to `N` and an error is raised with number `Q` not in that range, the error is aggregated in the `NULL` row. The `NULL` row is the row with `ERROR_NUMBER=0`, `ERROR_NAME=NULL`, and `SQLSTATE=NULL`.

The error summary tables have these indexes:

- `events_errors_summary_by_account_by_error`:
  - Primary key on (`USER`, `HOST`, `ERROR_NUMBER`)
- `events_errors_summary_by_host_by_error`:
  - Primary key on (`HOST`, `ERROR_NUMBER`)
- `events_errors_summary_by_thread_by_error`:
  - Primary key on (`THREAD_ID`, `ERROR_NUMBER`)
- `events_errors_summary_by_user_by_error`:
  - Primary key on (`USER`, `ERROR_NUMBER`)
- `events_errors_summary_global_by_error`:
  - Primary key on (`ERROR_NUMBER`)

`TRUNCATE TABLE` is permitted for error summary tables. It has these effects:

- For summary tables not aggregated by account, host, or user, truncation resets the summary columns to zero or `NULL` rather than removing rows.
- For summary tables aggregated by account, host, or user, truncation removes rows for accounts, hosts, or users with no connections, and resets the summary columns to zero or `NULL` for the remaining rows.

In addition, each error summary table that is aggregated by account, host, user, or thread is implicitly truncated by truncation of the connection table on which it depends, or truncation of `events_errors_summary_global_by_error`. For details, see [Section 29.12.8, “Performance Schema Connection Tables”](#).

## 29.12.20.12 Status Variable Summary Tables

The Performance Schema makes status variable information available in the tables described in [Section 29.12.15, “Performance Schema Status Variable Tables”](#). It also makes aggregated status variable information available in summary tables, described here. Each status variable summary table has one or more grouping columns to indicate how the table aggregates status values:

- `status_by_account` has `USER`, `HOST`, and `VARIABLE_NAME` columns to summarize status variables by account.
- `status_by_host` has `HOST` and `VARIABLE_NAME` columns to summarize status variables by the host from which clients connected.

- `status_by_user` has `USER` and `VARIABLE_NAME` columns to summarize status variables by client user name.

Each status variable summary table has this summary column containing aggregated values:

- `VARIABLE_VALUE`

The aggregated status variable value for active and terminated sessions.

The status variable summary tables have these indexes:

- `status_by_account`:
  - Primary key on (`USER`, `HOST`, `VARIABLE_NAME`)
- `status_by_host`:
  - Primary key on (`HOST`, `VARIABLE_NAME`)
- `status_by_user`:
  - Primary key on (`USER`, `VARIABLE_NAME`)

The meaning of “account” in these tables is similar to its meaning in the MySQL grant tables in the `mysql` system database, in the sense that the term refers to a combination of user and host values. They differ in that, for grant tables, the host part of an account can be a pattern, whereas for Performance Schema tables, the host value is always a specific nonpattern host name.

Account status is collected when sessions terminate. The session status counters are added to the global status counters and the corresponding account status counters. If account statistics are not collected, the session status is added to host and user status, if host and user status are collected.

Account, host, and user statistics are not collected if the `performance_schema_accounts_size`, `performance_schema_hosts_size`, and `performance_schema_users_size` system variables, respectively, are set to 0.

The Performance Schema supports `TRUNCATE TABLE` for status variable summary tables as follows; in all cases, status for active sessions is unaffected:

- `status_by_account`: Aggregates account status from terminated sessions to user and host status, then resets account status.
- `status_by_host`: Resets aggregated host status from terminated sessions.
- `status_by_user`: Resets aggregated user status from terminated sessions.

`FLUSH STATUS` adds the session status from all active sessions to the global status variables, resets the status of all active sessions, and resets account, host, and user status values aggregated from disconnected sessions.

## 29.12.21 Performance Schema Telemetry Tables

The following sections describe tables associated with the Telemetry services:

### 29.12.21.1 The `setup_meters` Table

The `setup_meters` table lists the registered meters:

```
mysql> select * from performance_schema.setup_meters;
+-----+-----+-----+
| NAME | FREQUENCY | ENABLED | DESCRIPTION |
+-----+-----+-----+
```

mysql.inno	10	YES	MySQL InnoDB metrics	
mysql.inno.buffer_pool	10	YES	MySQL InnoDB buffer pool metrics	
mysql.inno.data	10	YES	MySQL InnoDB data metrics	
mysql.x	10	YES	MySQL X plugin metrics	
mysql.x.stmt	10	YES	MySQL X plugin statement statistics	
mysql.stats	10	YES	MySQL core metrics	
mysql.stats.com	10	YES	MySQL command stats	
mysql.stats.connection	10	YES	MySQL connection stats	
mysql.stats.handler	10	YES	MySQL handler stats	
mysql.stats.ssl	10	YES	MySQL TLS related stats	
mysql.myisam	10	YES	MySQL MYISAM storage engine stats	
mysql.perf_schema	10	YES	MySQL performance_schema lost instruments	

- **NAME:** Name of the meter.
- **FREQUENCY:** Frequency in seconds of metric export. Default is every 10 seconds. This value can be edited for registered meters.
- **ENABLED:** Whether the meter is enabled. The value is YES or NO. A disabled meter exports no metrics. This column can be modified
- **DESCRIPTION:** A string describing the meter.

**FREQUENCY** and **ENABLED** can be edited.

### 29.12.21.2 The setup\_metrics Table

The `setup_metrics` table lists the available metrics:

```
mysql> select * from performance_schema.setup_metrics\G
***** 34. row *****
 NAME: undo tablespaces_active
 METER: mysql.inno
METRIC_TYPE: ASYNC GAUGE COUNTER
 NUM_TYPE: INTEGER
 UNIT:
DESCRIPTION: Number of active undo tablespaces, including implicit and explicit tablespaces (innodb_und
.

.
***** 48. row *****
 NAME: wait_free
 METER: mysql.inno.buffer_pool
METRIC_TYPE: ASYNC COUNTER
 NUM_TYPE: INTEGER
 UNIT:
DESCRIPTION: Number of times waited for free buffer (innodb_buffer_pool_wait_free)

.
***** 55. row *****
 NAME: reads
 METER: mysql.inno.data
METRIC_TYPE: ASYNC COUNTER
 NUM_TYPE: INTEGER
 UNIT:
DESCRIPTION: Number of reads initiated (innodb_data_reads)

.
***** 101. row *****
 NAME: ssl_finished_accepts
 METER: mysql.x
METRIC_TYPE: ASYNC COUNTER
 NUM_TYPE: INTEGER
 UNIT:

```

The `setup_metrics` table has the following columns:

- **NAME:** Name of the metric.

- **METER**: Name of the meter group of the metric.
- **METRIC\_TYPE**: The OpenTelemetry metric type.
- **NUM\_TYPE**: The numeric type. **INTEGER** or **DOUBLE**.
- **DESCRIPTION**: A string describing the metric's purpose.

## 29.12.22 Performance Schema Miscellaneous Tables

The following sections describe tables that do not fall into the table categories discussed in the preceding sections:

- **component\_scheduler\_tasks**: The current status of each scheduled task.
- **error\_log**: The most recent events written to the error log.
- **host\_cache**: Information from the internal host cache.
- **innodb\_redo\_log\_files**: Information about InnoDB redo log files.
- **log\_status**: Information about server logs for backup purposes.
- **performance\_timers**: Which event timers are available.
- **processlist**: Information about server processes.
- **threads**: Information about server threads.
- **tls\_channel\_status**: TLS context properties for connection interfaces.
- **user\_defined\_functions**: Loadable functions registered by a component, plugin, or **CREATE FUNCTION** statement.

### 29.12.22.1 The component\_scheduler\_tasks Table

The **component\_scheduler\_tasks** table contains a row for each scheduled task. Each row contains information about the ongoing progress of a task that applications, components, and plugins can implement, optionally, using the **scheduler** component (see [Section 7.5.5, “Scheduler Component”](#)). For example, the **audit\_log** server plugin utilizes the **scheduler** component to run a regular, recurring flush of its memory cache:

```
mysql> select * from performance_schema.component_scheduler_tasks\G
***** 1. row *****
 NAME: plugin_audit_log_flush_scheduler
 STATUS: WAITING
 COMMENT: Registered by the audit log plugin. Does a periodic refresh of the audit log
 in-memory rules cache by calling audit_log_flush
INTERVAL_SECONDS: 100
 TIMES_RUN: 5
 TIMES_FAILED: 0
1 row in set (0.02 sec)
```

The **component\_scheduler\_tasks** table has the following columns:

- **NAME**  
The name supplied during the registration.
- **STATUS**  
The values are:
  - **RUNNING** if the task is active and being executed.

- **WAITING** if the task is idle and waiting for the background thread to pick it up or waiting for the next time it needs to be run to arrive.

- **COMMENT**

A compile-time comment provided by an application, component, or plugin. In the previous example, MySQL Enterprise Audit provides the comment using a server plugin named `audit_log`.

- **INTERVAL\_SECONDS**

The time in seconds to run a task, which an application, component, or plugin provides. MySQL Enterprise Audit enables you to specify this value using the `audit_log_flush_interval_seconds` system variable.

- **TIMES\_RUN**

A counter that increments by one every time the task runs successfully. It wraps around.

- **TIMES\_FAILED**

A counter that increments by one every time the execution of the task fails. It wraps around.

## 29.12.22.2 The `error_log` Table

Of the logs the MySQL server maintains, one is the error log to which it writes diagnostic messages (see [Section 7.4.2, “The Error Log”](#)). Typically, the server writes diagnostics to a file on the server host or to a system log service. Depending on error log configuration, the server can also write the most recent error events to the Performance Schema `error_log` table. Granting the `SELECT` privilege for the `error_log` table thus gives clients and applications access to error log contents using SQL queries, enabling DBAs to provide access to the log without the need to permit direct file system access on the server host.

The `error_log` table supports focused queries based on its more structured columns. It also includes the full text of error messages to support more free-form analysis.

The table implementation uses a fixed-size, in-memory ring buffer, with old events automatically discarded as necessary to make room for new ones.

Example `error_log` contents:

```
mysql> SELECT * FROM performance_schema.error_log\G
***** 1. row *****
 LOGGED: 2020-08-06 09:25:00.338624
 THREAD_ID: 0
 PRIO: System
ERROR_CODE: MY-010116
SUBSYSTEM: Server
 DATA: mysqld (mysqld 8.4.6) starting as process 96344
***** 2. row *****
 LOGGED: 2020-08-06 09:25:00.363521
 THREAD_ID: 1
 PRIO: System
ERROR_CODE: MY-013576
SUBSYSTEM: InnoDB
 DATA: InnoDB initialization has started.
...
***** 65. row *****
 LOGGED: 2020-08-06 09:25:02.936146
 THREAD_ID: 0
 PRIO: Warning
ERROR_CODE: MY-010068
SUBSYSTEM: Server
 DATA: CA certificate /var/mysql/sslinfo/cacert.pem is self signed.
...
***** 89. row *****
 LOGGED: 2020-08-06 09:25:03.112801
```

```
THREAD_ID: 0
PRIO: System
ERROR_CODE: MY-013292
SUBSYSTEM: Server
DATA: Admin interface ready for connections, address: '127.0.0.1' port: 33062
```

The `error_log` table has the following columns. As indicated in the descriptions, all but the `DATA` column correspond to fields of the underlying error event structure, which is described in [Section 7.4.2.3, “Error Event Fields”](#).

- [LOGGED](#)

The event timestamp, with microsecond precision. `LOGGED` corresponds to the `time` field of error events, although with certain potential differences:

- `time` values in the error log are displayed according to the `log_timestamps` system variable setting; see [Early-Startup Logging Output Format](#).
- The `LOGGED` column stores values using the `TIMESTAMP` data type, for which values are stored in UTC but displayed when retrieved in the current session time zone; see [Section 13.2.2, “The DATE, DATETIME, and TIMESTAMP Types”](#).

To display `LOGGED` values in the same time zone as displayed in the error log file, first set the session time zone as follows:

```
SET @@session.time_zone = @@global.log_timestamps;
```

If the `log_timestamps` value is `UTC` and your system does not have named time zone support installed (see [Section 7.1.15, “MySQL Server Time Zone Support”](#)), set the time zone like this:

```
SET @@session.time_zone = '+00:00';
```

- [THREAD\\_ID](#)

The MySQL thread ID. `THREAD_ID` corresponds to the `thread` field of error events.

Within the Performance Schema, the `THREAD_ID` column in the `error_log` table is most similar to the `PROCESSLIST_ID` column of the `threads` table:

- For foreground threads, `THREAD_ID` and `PROCESSLIST_ID` represent a connection identifier. This is the same value displayed in the `ID` column of the `INFORMATION_SCHEMA PROCESSLIST` table, displayed in the `Id` column of `SHOW PROCESSLIST` output, and returned by the `CONNECTION_ID()` function within the thread.
- For background threads, `THREAD_ID` is 0 and `PROCESSLIST_ID` is `NULL`.

Many Performance Schema tables other than `error_log` has a column named `THREAD_ID`, but in those tables, the `THREAD_ID` column is a value assigned internally by the Performance Schema.

- [PRIO](#)

The event priority. Permitted values are `System`, `Error`, `Warning`, `Note`. The `PRIO` column is based on the `label` field of error events, which itself is based on the underlying numeric `prio` field value.

- [ERROR\\_CODE](#)

The numeric event error code. `ERROR_CODE` corresponds to the `error_code` field of error events.

- [SUBSYSTEM](#)

The subsystem in which the event occurred. `SUBSYSTEM` corresponds to the `subsystem` field of error events.

- **DATA**

The text representation of the error event. The format of this value depends on the format produced by the log sink component that generates the `error_log` row. For example, if the log sink is `log_sink_internal` or `log_sink_json`, `DATA` values represent error events in traditional or JSON format, respectively. (See [Section 7.4.2.9, “Error Log Output Format”](#).)

Because the error log can be reconfigured to change the log sink component that supplies rows to the `error_log` table, and because different sinks produce different output formats, it is possible for rows written to the `error_log` table at different times to have different `DATA` formats.

The `error_log` table has these indexes:

- Primary key on (`LOGGED`)
- Index on (`THREAD_ID`)
- Index on (`PRIOR`)
- Index on (`ERROR_CODE`)
- Index on (`SUBSYSTEM`)

`TRUNCATE TABLE` is not permitted for the `error_log` table.

## Implementation and Configuration of the `error_log` Table

The Performance Schema `error_log` table is populated by error log sink components that write to the table in addition to writing formatted error events to the error log. Performance Schema support by log sinks has two parts:

- A log sink can write new error events to the `error_log` table as they occur.
- A log sink can provide a parser for extraction of previously written error messages. This enables a server instance to read messages written to an error log file by the previous instance and store them in the `error_log` table. Messages written during shutdown by the previous instance may be useful for diagnosing why shutdown occurred.

Currently, the traditional-format `log_sink_internal` and JSON-format `log_sink_json` sinks support writing new events to the `error_log` table and provide a parser for reading previously written error log files.

The `log_error_services` system variable controls which log components to enable for error logging. Its value is a pipeline of log filter and log sink components to be executed in left-to-right order when error events occur. The `log_error_services` value pertains to populating the `error_log` table as follows:

- At startup, the server examines the `log_error_services` value and chooses from it the leftmost log sink that satisfies these conditions:
  - A sink that supports the `error_log` table and provides a parser.
  - If none, a sink that supports the `error_log` table but provides no parser.

If no log sink satisfies those conditions, the `error_log` table remains empty. Otherwise, if the sink provides a parser and log configuration enables a previously written error log file to be found, the server uses the sink parser to read the last part of the file and writes the old events it contains to the table. The sink then writes new error events to the table as they occur.

- At runtime, if the value of `log_error_services` changes, the server again examines it, this time looking for the leftmost enabled log sink that supports the `error_log` table, regardless of whether it provides a parser.

If no such log sink exists, no additional error events are written to the `error_log` table. Otherwise, the newly configured sink writes new error events to the table as they occur.

Any configuration that affects output written to the error log affects `error_log` table contents. This includes settings such as those for verbosity, message suppression, and message filtering. It also applies to information read at startup from a previous log file. For example, messages not written during a previous server instance configured with low verbosity do not become available if the file is read by a current instance configured with higher verbosity.

The `error_log` table is a view on a fixed-size, in-memory ring buffer, with old events automatically discarded as necessary to make room for new ones. As shown in the following table, several status variables provide information about ongoing `error_log` operation.

Status Variable	Meaning
<code>Error_log_buffered_bytes</code>	Bytes used in table
<code>Error_log_buffered_events</code>	Events present in table
<code>Error_log_expired_events</code>	Events discarded from table
<code>Error_log_latest_write</code>	Time of last write to table

### 29.12.22.3 The `host_cache` Table

The MySQL server maintains an in-memory host cache that contains client host name and IP address information and is used to avoid Domain Name System (DNS) lookups. The `host_cache` table exposes the contents of this cache. The `host_cache_size` system variable controls the size of the host cache, as well as the size of the `host_cache` table. For operational and configuration information about the host cache, see [Section 7.1.12.3, “DNS Lookups and the Host Cache”](#).

Because the `host_cache` table exposes the contents of the host cache, it can be examined using `SELECT` statements. This may help you diagnose the causes of connection problems.

The `host_cache` table has these columns:

- `IP`

The IP address of the client that connected to the server, expressed as a string.

- `HOST`

The resolved DNS host name for that client IP, or `NULL` if the name is unknown.

- `HOST_VALIDATED`

Whether the IP-to-host name-to-IP DNS resolution was performed successfully for the client IP. If `HOST_VALIDATED` is `YES`, the `HOST` column is used as the host name corresponding to the IP so that additional calls to DNS can be avoided. While `HOST_VALIDATED` is `NO`, DNS resolution is attempted for each connection attempt, until it eventually completes with either a valid result or a permanent error. This information enables the server to avoid caching bad or missing host names during temporary DNS failures, which would negatively affect clients forever.

- `SUM_CONNECT_ERRORS`

The number of connection errors that are deemed “blocking” (assessed against the `max_connect_errors` system variable). Only protocol handshake errors are counted, and only for hosts that passed validation (`HOST_VALIDATED = YES`).

Once `SUM_CONNECT_ERRORS` for a given host reaches the value of `max_connect_errors`, new connections from that host are blocked. The `SUM_CONNECT_ERRORS` value can exceed the `max_connect_errors` value because multiple connection attempts from a host can occur

simultaneously while the host is not blocked. Any or all of them can fail, independently incrementing `SUM_CONNECT_ERRORS`, possibly beyond the value of `max_connect_errors`.

Suppose that `max_connect_errors` is 200 and `SUM_CONNECT_ERRORS` for a given host is 199. If 10 clients attempt to connect from that host simultaneously, none of them are blocked because `SUM_CONNECT_ERRORS` has not reached 200. If blocking errors occur for five of the clients, `SUM_CONNECT_ERRORS` is increased by one for each client, for a resulting `SUM_CONNECT_ERRORS` value of 204. The other five clients succeed and are not blocked because the value of `SUM_CONNECT_ERRORS` when their connection attempts began had not reached 200. New connections from the host that begin after `SUM_CONNECT_ERRORS` reaches 200 are blocked.

- `COUNT_HOST_BLOCKED_ERRORS`

The number of connections that were blocked because `SUM_CONNECT_ERRORS` exceeded the value of the `max_connect_errors` system variable.

- `COUNT_NAMEINFO_TRANSIENT_ERRORS`

The number of transient errors during IP-to-host name DNS resolution.

- `COUNT_NAMEINFO_PERMANENT_ERRORS`

The number of permanent errors during IP-to-host name DNS resolution.

- `COUNT_FORMAT_ERRORS`

The number of host name format errors. MySQL does not perform matching of `Host` column values in the `mysql.user` system table against host names for which one or more of the initial components of the name are entirely numeric, such as `1.2.example.com`. The client IP address is used instead. For the rationale why this type of matching does not occur, see [Section 8.2.4, “Specifying Account Names”](#).

- `COUNT_ADDRINFO_TRANSIENT_ERRORS`

The number of transient errors during host name-to-IP reverse DNS resolution.

- `COUNT_ADDRINFO_PERMANENT_ERRORS`

The number of permanent errors during host name-to-IP reverse DNS resolution.

- `COUNT_FCRDNS_ERRORS`

The number of forward-confirmed reverse DNS errors. These errors occur when IP-to-host name-to-IP DNS resolution produces an IP address that does not match the client originating IP address.

- `COUNT_HOST_ACL_ERRORS`

The number of errors that occur because no users are permitted to connect from the client host. In such cases, the server returns `ER_HOST_NOT_PRIVILEGED` and does not even ask for a user name or password.

- `COUNT_NO_AUTH_PLUGIN_ERRORS`

The number of errors due to requests for an unavailable authentication plugin. A plugin can be unavailable if, for example, it was never loaded or a load attempt failed.

- `COUNT_AUTH_PLUGIN_ERRORS`

The number of errors reported by authentication plugins.

An authentication plugin can report different error codes to indicate the root cause of a failure. Depending on the type of error, one of these columns is

incremented: `COUNT_AUTHENTICATION_ERRORS`, `COUNT_AUTH_PLUGIN_ERRORS`, `COUNT_HANDSHAKE_ERRORS`. New return codes are an optional extension to the existing plugin API. Unknown or unexpected plugin errors are counted in the `COUNT_AUTH_PLUGIN_ERRORS` column.

- `COUNT_HANDSHAKE_ERRORS`

The number of errors detected at the wire protocol level.

- `COUNT_PROXY_USER_ERRORS`

The number of errors detected when proxy user A is proxied to another user B who does not exist.

- `COUNT_PROXY_USER_ACL_ERRORS`

The number of errors detected when proxy user A is proxied to another user B who does exist but for whom A does not have the `PROXY` privilege.

- `COUNT_AUTHENTICATION_ERRORS`

The number of errors caused by failed authentication.

- `COUNT_SSL_ERRORS`

The number of errors due to SSL problems.

- `COUNT_MAX_USER_CONNECTIONS_ERRORS`

The number of errors caused by exceeding per-user connection quotas. See [Section 8.2.21, “Setting Account Resource Limits”](#).

- `COUNT_MAX_USER_CONNECTIONS_PER_HOUR_ERRORS`

The number of errors caused by exceeding per-user connections-per-hour quotas. See [Section 8.2.21, “Setting Account Resource Limits”](#).

- `COUNT_DEFAULT_DATABASE_ERRORS`

The number of errors related to the default database. For example, the database does not exist or the user has no privileges to access it.

- `COUNT_INIT_CONNECT_ERRORS`

The number of errors caused by execution failures of statements in the `init_connect` system variable value.

- `COUNT_LOCAL_ERRORS`

The number of errors local to the server implementation and not related to the network, authentication, or authorization. For example, out-of-memory conditions fall into this category.

- `COUNT_UNKNOWN_ERRORS`

The number of other, unknown errors not accounted for by other columns in this table. This column is reserved for future use, in case new error conditions must be reported, and if preserving the backward compatibility and structure of the `host_cache` table is required.

- `FIRST_SEEN`

The timestamp of the first connection attempt seen from the client in the `IP` column.

- `LAST_SEEN`

The timestamp of the most recent connection attempt seen from the client in the `IP` column.

- **FIRST\_ERROR\_SEEN**

The timestamp of the first error seen from the client in the `IP` column.

- **LAST\_ERROR\_SEEN**

The timestamp of the most recent error seen from the client in the `IP` column.

The `host_cache` table has these indexes:

- Primary key on (`IP`)
- Index on (`HOST`)

`TRUNCATE TABLE` is permitted for the `host_cache` table. It requires the `DROP` privilege for the table. Truncating the table flushes the host cache, which has the effects described in [Flushing the Host Cache](#).

#### 29.12.22.4 The `innodb_redo_log_files` Table

The `innodb_redo_log_files` table contains a row for each active `InnoDB` redo log file.

The `innodb_redo_log_files` table has the following columns:

- **FILE\_ID**

The ID of the redo log file. The value corresponds to the redo log file number.

- **FILE\_NAME**

The path and file name of the redo log file.

- **START\_LSN**

The log sequence number of the first block in the redo log file.

- **END\_LSN**

The log sequence number after the last block in the redo log file.

- **SIZE\_IN\_BYTES**

The size of the redo log data in the file, in bytes. Data size is measured from the `END_LSN` to the start >`START_LSN`. The redo log file size on disk is slightly larger due to the file header (2048 bytes), which is not included in the value reported by this column.

- **IS\_FULL**

Whether the redo log file is full. A value of 0 indicates that free space in the file. A value of 1 indicates that the file is full.

- **CONSUMER\_LEVEL**

Reserved for future use.

#### 29.12.22.5 The `log_status` Table

The `log_status` table provides information that enables an online backup tool to copy the required log files without locking those resources for the duration of the copy process.

When the `log_status` table is queried, the server blocks logging and related administrative changes for just long enough to populate the table, then releases the resources. The `log_status` table informs

the online backup which point it should copy up to in the source's binary log and `gtid_executed` record, and the relay log for each replication channel. It also provides relevant information for individual storage engines, such as the last log sequence number (LSN) and the LSN of the last checkpoint taken for the `InnoDB` storage engine.

The `log_status` table has these columns:

- `SERVER_UUID`

The server UUID for this server instance. This is the generated unique value of the read-only system variable `server_uuid`.

- `LOCAL`

The log position state information from the source, provided as a single JSON object with the following keys:

`binary_log_file`

The name of the current binary log file.

`binary_log_position`

The current binary log position at the time the `log_status` table was accessed.

`gtid_executed`

The current value of the global server variable `gtid_executed` at the time the `log_status` table was accessed. This information is consistent with the `binary_log_file` and `binary_log_position` keys.

- `REPLICATION`

A JSON array of channels, each with the following information:

`channel_name`

The name of the replication channel. The default replication channel's name is the empty string ("").

`relay_log_file`

The name of the current relay log file for the replication channel.

`relay_log_pos`

The current relay log position at the time the `log_status` table was accessed.

- `STORAGE_ENGINES`

Relevant information from individual storage engines, provided as a JSON object with one key for each applicable storage engine.

The `log_status` table has no indexes.

The `BACKUP_ADMIN` privilege, as well as the `SELECT` privilege, is required for access to the `log_status` table.

`TRUNCATE TABLE` is not permitted for the `log_status` table.

## 29.12.22.6 The `performance_timers` Table

The `performance_timers` table shows which event timers are available:

TIMER_NAME	TIMER_FREQUENCY	TIMER_RESOLUTION	TIMER_OVERHEAD
CYCLE	2389029850	1	72
NANOSECOND	1000000000	1	112
MICROSECOND	1000000	1	136
MILLISECOND	1036	1	168

THREAD_CPU	339101694	1	798
------------	-----------	---	-----

If the values associated with a given timer name are `NULL`, that timer is not supported on your platform. For an explanation of how event timing occurs, see [Section 29.4.1, “Performance Schema Event Timing”](#).

The `performance_timers` table has these columns:

- `TIMER_NAME`

The timer name.

- `TIMER_FREQUENCY`

The number of timer units per second. For a cycle timer, the frequency is generally related to the CPU speed. For example, on a system with a 2.4GHz processor, the `CYCLE` may be close to 2400000000.

- `TIMER_RESOLUTION`

Indicates the number of timer units by which timer values increase. If a timer has a resolution of 10, its value increases by 10 each time.

- `TIMER_OVERHEAD`

The minimal number of cycles of overhead to obtain one timing with the given timer. The Performance Schema determines this value by invoking the timer 20 times during initialization and picking the smallest value. The total overhead really is twice this amount because the instrumentation invokes the timer at the start and end of each event. The timer code is called only for timed events, so this overhead does not apply for nontimed events.

The `performance_timers` table has no indexes.

`TRUNCATE TABLE` is not permitted for the `performance_timers` table.

### 29.12.22.7 The processlist Table

The MySQL process list indicates the operations currently being performed by the set of threads executing within the server. The `processlist` table is one source of process information. For a comparison of this table with other sources, see [Sources of Process Information](#).

The `processlist` table can be queried directly. If you have the `PROCESS` privilege, you can see all threads, even those belonging to other users. Otherwise (without the `PROCESS` privilege), nonanonymous users have access to information about their own threads but not threads for other users, and anonymous users have no access to thread information.

#### Note

If the `performance_schema_show_processlist` system variable is enabled, the `processlist` table also serves as the basis for an alternative implementation underlying the `SHOW PROCESSLIST` statement. For details, see later in this section.

The `processlist` table contains a row for each server process:

```
mysql> SELECT * FROM performance_schema.processlist\G
***** 1. row *****
 ID: 5
 USER: event_scheduler
 HOST: localhost
 DB: NULL
 COMMAND: Daemon
```

```

TIME: 137
STATE: Waiting on empty queue
INFO: NULL
***** 2. row *****
ID: 9
USER: me
HOST: localhost:58812
DB: NULL
COMMAND: Sleep
TIME: 95
STATE:
INFO: NULL
***** 3. row *****
ID: 10
USER: me
HOST: localhost:58834
DB: test
COMMAND: Query
TIME: 0
STATE: executing
INFO: SELECT * FROM performance_schema.processlist
...

```

The `processlist` table has these columns:

- **ID**

The connection identifier. This is the same value displayed in the `Id` column of the `SHOW PROCESSLIST` statement, displayed in the `PROCESSLIST_ID` column of the Performance Schema `threads` table, and returned by the `CONNECTION_ID()` function within the thread.

- **USER**

The MySQL user who issued the statement. A value of `system user` refers to a nonclient thread spawned by the server to handle tasks internally, for example, a delayed-row handler thread or an I/O or SQL thread used on replica hosts. For `system user`, there is no host specified in the `Host` column. `unauthenticated user` refers to a thread that has become associated with a client connection but for which authentication of the client user has not yet occurred. `event_scheduler` refers to the thread that monitors scheduled events (see [Section 27.4, “Using the Event Scheduler”](#)).

**Note**

A `USER` value of `system user` is distinct from the `SYSTEM_USER` privilege. The former designates internal threads. The latter distinguishes the system user and regular user account categories (see [Section 8.2.11, “Account Categories”](#)).

- **HOST**

The host name of the client issuing the statement (except for `system user`, for which there is no host). The host name for TCP/IP connections is reported in `host_name:client_port` format to make it easier to determine which client is doing what.

- **DB**

The default database for the thread, or `NULL` if none has been selected.

- **COMMAND**

The type of command the thread is executing on behalf of the client, or `Sleep` if the session is idle. For descriptions of thread commands, see [Section 10.14, “Examining Server Thread \(Process\) Information”](#). The value of this column corresponds to the `COM_xxx` commands of the client/server protocol and `Com_xxx` status variables. See [Section 7.1.10, “Server Status Variables”](#)

- **TIME**

The time in seconds that the thread has been in its current state. For a replica SQL thread, the value is the number of seconds between the timestamp of the last replicated event and the real time of the replica host. See [Section 19.2.3, “Replication Threads”](#).

- [STATE](#)

An action, event, or state that indicates what the thread is doing. For descriptions of [STATE](#) values, see [Section 10.14, “Examining Server Thread \(Process\) Information”](#).

Most states correspond to very quick operations. If a thread stays in a given state for many seconds, there might be a problem that needs to be investigated.

- [INFO](#)

The statement the thread is executing, or [NULL](#) if it is executing no statement. The statement might be the one sent to the server, or an innermost statement if the statement executes other statements. For example, if a [CALL](#) statement executes a stored procedure that is executing a [SELECT](#) statement, the [INFO](#) value shows the [SELECT](#) statement.

- [EXECUTION\\_ENGINE](#)

The query execution engine. The value is either [PRIMARY](#) or [SECONDARY](#). For use with MySQL HeatWave Service and MySQL HeatWave, where the [PRIMARY](#) engine is [InnoDB](#) and the [SECONDARY](#) engine is MySQL HeatWave ([RAPID](#)). For MySQL Community Edition Server, MySQL Enterprise Edition Server (on-premise), and MySQL HeatWave Service without MySQL HeatWave, the value is always [PRIMARY](#).

The [processlist](#) table has these indexes:

- Primary key on ([ID](#))

[TRUNCATE TABLE](#) is not permitted for the [processlist](#) table.

As mentioned previously, if the [performance\\_schema\\_show\\_processlist](#) system variable is enabled, the [processlist](#) table serves as the basis for an alternative implementation of other process information sources:

- The [SHOW PROCESSLIST](#) statement.
- The [mysqladmin processlist](#) command (which uses [SHOW PROCESSLIST](#) statement).

The default [SHOW PROCESSLIST](#) implementation iterates across active threads from within the thread manager while holding a global mutex. This has negative performance consequences, particularly on busy systems. The alternative [SHOW PROCESSLIST](#) implementation is based on the Performance Schema [processlist](#) table. This implementation queries active thread data from the Performance Schema rather than the thread manager and does not require a mutex.

MySQL configuration affects [processlist](#) table contents as follows:

- Minimum required configuration:
  - The MySQL server must be configured and built with thread instrumentation enabled. This is true by default; it is controlled using the [DISABLE\\_PSI\\_THREAD](#) CMake option.
  - The Performance Schema must be enabled at server startup. This is true by default; it is controlled using the [performance\\_schema](#) system variable.

With that configuration satisfied, [performance\\_schema\\_show\\_processlist](#) enables or disables the alternative [SHOW PROCESSLIST](#) implementation. If the minimum configuration is not satisfied, the [processlist](#) table (and thus [SHOW PROCESSLIST](#)) may not return all data.

- Recommended configuration:
  - To avoid having some threads ignored:
    - Leave the `performance_schema_max_thread_instances` system variable set to its default or set it at least as great as the `max_connections` system variable.
    - Leave the `performance_schema_max_thread_classes` system variable set to its default.
  - To avoid having some `STATE` column values be empty, leave the `performance_schema_max_stage_classes` system variable set to its default.

The default for those configuration parameters is `-1`, which causes the Performance Schema to autosize them at server startup. With the parameters set as indicated, the `processlist` table (and thus `SHOW PROCESSLIST`) produce complete process information.

The preceding configuration parameters affect the contents of the `processlist` table. For a given configuration, however, the `processlist` contents are unaffected by the `performance_schema_show_processlist` setting.

The alternative process list implementation does not apply to the `INFORMATION_SCHEMA PROCESSLIST` table or the `COM_PROCESS_INFO` command of the MySQL client/server protocol.

#### 29.12.22.8 The threads Table

The `threads` table contains a row for each server thread. Each row contains information about a thread and indicates whether monitoring and historical event logging are enabled for it:

```
mysql> SELECT * FROM performance_schema.threads\G
***** 1. row *****
 THREAD_ID: 1
 NAME: thread/sql/main
 TYPE: BACKGROUND
 PROCESSLIST_ID: NULL
PROCESSLIST_USER: NULL
PROCESSLIST_HOST: NULL
 PROCESSLIST_DB: mysql
PROCESSLIST_COMMAND: NULL
 PROCESSLIST_TIME: 418094
PROCESSLIST_STATE: NULL
 PROCESSLIST_INFO: NULL
 PARENT_THREAD_ID: NULL
 ROLE: NULL
 INSTRUMENTED: YES
 HISTORY: YES
 CONNECTION_TYPE: NULL
 THREAD_OS_ID: 5856
 RESOURCE_GROUP: SYS_default
EXECUTION_ENGINE: PRIMARY
CONTROLLED_MEMORY: 1456
MAX_CONTROLLED_MEMORY: 67480
 TOTAL_MEMORY: 1270430
MAX_TOTAL_MEMORY: 1307317
TELEMETRY_ACTIVE: NO
...
```

When the Performance Schema initializes, it populates the `threads` table based on the threads in existence then. Thereafter, a new row is added each time the server creates a thread.

The `INSTRUMENTED` and `HISTORY` column values for new threads are determined by the contents of the `setup_actors` table. For information about how to use the `setup_actors` table to control these columns, see [Section 29.4.6, “Pre-Filtering by Thread”](#).

Removal of rows from the `threads` table occurs when threads end. For a thread associated with a client session, removal occurs when the session ends. If a client has auto-reconnect enabled and

the session reconnects after a disconnect, the session becomes associated with a new row in the `threads` table that has a different `PROCESSLIST_ID` value. The initial `INSTRUMENTED` and `HISTORY` values for the new thread may be different from those of the original thread: The `setup_actors` table may have changed in the meantime, and if the `INSTRUMENTED` or `HISTORY` value for the original thread was changed after the row was initialized, the change does not carry over to the new thread.

You can enable or disable thread monitoring (that is, whether events executed by the thread are instrumented) and historical event logging. To control the initial `INSTRUMENTED` and `HISTORY` values for new foreground threads, use the `setup_actors` table. To control these aspects of existing threads, set the `INSTRUMENTED` and `HISTORY` columns of `threads` table rows. (For more information about the conditions under which thread monitoring and historical event logging occur, see the descriptions of the `INSTRUMENTED` and `HISTORY` columns.)

For a comparison of the `threads` table columns with names having a prefix of `PROCESSLIST_` to other process information sources, see [Sources of Process Information](#).

### Important

For thread information sources other than the `threads` table, information about threads for other users is shown only if the current user has the `PROCESS` privilege. That is not true of the `threads` table; all rows are shown to any user who has the `SELECT` privilege for the table. Users who should not be able to see threads for other users by accessing the `threads` table should not be given the `SELECT` privilege for it.

The `threads` table has these columns:

- `THREAD_ID`

A unique thread identifier.

- `NAME`

The name associated with the thread instrumentation code in the server. For example, `thread/sql/one_connection` corresponds to the thread function in the code responsible for handling a user connection, and `thread/sql/main` stands for the `main()` function of the server.

- `TYPE`

The thread type, either `FOREGROUND` or `BACKGROUND`. User connection threads are foreground threads. Threads associated with internal server activity are background threads. Examples are internal InnoDB threads, “binlog dump” threads sending information to replicas, and replication I/O and SQL threads.

- `PROCESSLIST_ID`

For a foreground thread (associated with a user connection), this is the connection identifier. This is the same value displayed in the `ID` column of the `INFORMATION_SCHEMA PROCESSLIST` table, displayed in the `Id` column of `SHOW PROCESSLIST` output, and returned by the `CONNECTION_ID()` function within the thread.

For a background thread (not associated with a user connection), `PROCESSLIST_ID` is `NULL`, so the values are not unique.

- `PROCESSLIST_USER`

The user associated with a foreground thread, `NULL` for a background thread.

- `PROCESSLIST_HOST`

The host name of the client associated with a foreground thread, `NULL` for a background thread.

Unlike the `HOST` column of the `INFORMATION_SCHEMA PROCESSLIST` table or the `Host` column of `SHOW PROCESSLIST` output, the `PROCESSLIST_HOST` column does not include the port number for TCP/IP connections. To obtain this information from the Performance Schema, enable the socket instrumentation (which is not enabled by default) and examine the `socket_instances` table:

```
mysql> SELECT NAME, ENABLED, TIMED
 FROM performance_schema.setup_instruments
 WHERE NAME LIKE 'wait/io/socket%';
+-----+-----+-----+
| NAME | ENABLED | TIMED |
+-----+-----+-----+
| wait/io/socket/sql/server_tcpip_socket | NO | NO |
| wait/io/socket/sql/server_unix_socket | NO | NO |
| wait/io/socket/sql/client_connection | NO | NO |
+-----+-----+-----+
3 rows in set (0.01 sec)

mysql> UPDATE performance_schema.setup_instruments
 SET ENABLED='YES'
 WHERE NAME LIKE 'wait/io/socket%';
Query OK, 3 rows affected (0.00 sec)
Rows matched: 3 Changed: 3 Warnings: 0

mysql> SELECT * FROM performance_schema.socket_instances\G
***** 1. row *****
EVENT_NAME: wait/io/socket/sql/client_connection
OBJECT_INSTANCE_BEGIN: 140612577298432
THREAD_ID: 31
SOCKET_ID: 53
IP: ::ffff:127.0.0.1
PORT: 55642
STATE: ACTIVE
...
```

- `PROCESSLIST_DB`

The default database for the thread, or `NULL` if none has been selected.

- `PROCESSLIST_COMMAND`

For foreground threads, the type of command the thread is executing on behalf of the client, or `Sleep` if the session is idle. For descriptions of thread commands, see [Section 10.14, “Examining Server Thread \(Process\) Information”](#). The value of this column corresponds to the `COM_XXX` commands of the client/server protocol and `Com_XXX` status variables. See [Section 7.1.10, “Server Status Variables”](#)

Background threads do not execute commands on behalf of clients, so this column may be `NULL`.

- `PROCESSLIST_TIME`

The time in seconds that the thread has been in its current state. For a replica SQL thread, the value is the number of seconds between the timestamp of the last replicated event and the real time of the replica host. See [Section 19.2.3, “Replication Threads”](#).

- `PROCESSLIST_STATE`

An action, event, or state that indicates what the thread is doing. For descriptions of `PROCESSLIST_STATE` values, see [Section 10.14, “Examining Server Thread \(Process\) Information”](#). If the value is `NULL`, the thread may correspond to an idle client session or the work it is doing is not instrumented with stages.

Most states correspond to very quick operations. If a thread stays in a given state for many seconds, there might be a problem that bears investigation.

- `PROCESSLIST_INFO`

The statement the thread is executing, or `NULL` if it is executing no statement. The statement might be the one sent to the server, or an innermost statement if the statement executes other statements. For example, if a `CALL` statement executes a stored procedure that is executing a `SELECT` statement, the `PROCESSLIST_INFO` value shows the `SELECT` statement.

- `PARENT_THREAD_ID`

If this thread is a subthread (spawned by another thread), this is the `THREAD_ID` value of the spawning thread.

- `ROLE`

Unused.

- `INSTRUMENTED`

Whether events executed by the thread are instrumented. The value is `YES` or `NO`.

- For foreground threads, the initial `INSTRUMENTED` value is determined by whether the user account associated with the thread matches any row in the `setup_actors` table. Matching is based on the values of the `PROCESSLIST_USER` and `PROCESSLIST_HOST` columns.

If the thread spawns a subthread, matching occurs again for the `threads` table row created for the subthread.

- For background threads, `INSTRUMENTED` is `YES` by default. `setup_actors` is not consulted because there is no associated user for background threads.
- For any thread, its `INSTRUMENTED` value can be changed during the lifetime of the thread.

For monitoring of events executed by the thread to occur, these things must be true:

- The `thread_instrumentation` consumer in the `setup_consumers` table must be `YES`.
- The `threads.INSTRUMENTED` column must be `YES`.
- Monitoring occurs only for those thread events produced from instruments that have the `ENABLED` column set to `YES` in the `setup_instruments` table.

- `HISTORY`

Whether to log historical events for the thread. The value is `YES` or `NO`.

- For foreground threads, the initial `HISTORY` value is determined by whether the user account associated with the thread matches any row in the `setup_actors` table. Matching is based on the values of the `PROCESSLIST_USER` and `PROCESSLIST_HOST` columns.

If the thread spawns a subthread, matching occurs again for the `threads` table row created for the subthread.

- For background threads, `HISTORY` is `YES` by default. `setup_actors` is not consulted because there is no associated user for background threads.
- For any thread, its `HISTORY` value can be changed during the lifetime of the thread.

For historical event logging for the thread to occur, these things must be true:

- The appropriate history-related consumers in the `setup_consumers` table must be enabled. For example, wait event logging in the `events_waits_history` and `events_waits_history_long` tables requires the corresponding `events_waits_history` and `events_waits_history_long` consumers to be `YES`.

- The `threads.HISTORY` column must be `YES`.
- Logging occurs only for those thread events produced from instruments that have the `ENABLED` column set to `YES` in the `setup_instruments` table.
- `CONNECTION_TYPE`

The protocol used to establish the connection, or `NULL` for background threads. Permitted values are `TCP/IP` (TCP/IP connection established without encryption), `SSL/TLS` (TCP/IP connection established with encryption), `Socket` (Unix socket file connection), `Named Pipe` (Windows named pipe connection), and `Shared Memory` (Windows shared memory connection).

- `THREAD_OS_ID`

The thread or task identifier as defined by the underlying operating system, if there is one:

- When a MySQL thread is associated with the same operating system thread for its lifetime, `THREAD_OS_ID` contains the operating system thread ID.
- When a MySQL thread is not associated with the same operating system thread for its lifetime, `THREAD_OS_ID` contains `NULL`. This is typical for user sessions when the thread pool plugin is used (see Section 7.6.3, “MySQL Enterprise Thread Pool”).

For Windows, `THREAD_OS_ID` corresponds to the thread ID visible in Process Explorer (<https://technet.microsoft.com/en-us/sysinternals/bb896653.aspx>).

For Linux, `THREAD_OS_ID` corresponds to the value of the `gettid()` function. This value is exposed, for example, using the `perf` or `ps -L` commands, or in the `proc` file system (`/proc/[pid]/task/[tid]`). For more information, see the `perf-stat(1)`, `ps(1)`, and `proc(5)` man pages.

- `RESOURCE_GROUP`

The resource group label. This value is `NULL` if resource groups are not supported on the current platform or server configuration (see [Resource Group Restrictions](#)).

- `EXECUTION_ENGINE`

The query execution engine. The value is either `PRIMARY` or `SECONDARY`. For use with MySQL HeatWave Service and MySQL HeatWave, where the `PRIMARY` engine is `InnoDB` and the `SECONDARY` engine is MySQL HeatWave (`RAPID`). For MySQL Community Edition Server, MySQL Enterprise Edition Server (on-premise), and MySQL HeatWave Service without MySQL HeatWave, the value is always `PRIMARY`.

- `CONTROLLED_MEMORY`

Amount of controlled memory used by the thread.

- `MAX_CONTROLLED_MEMORY`

Maximum value of `CONTROLLED_MEMORY` seen during the thread execution.

- `TOTAL_MEMORY`

The current amount of memory, controlled or not, used by the thread.

- `MAX_TOTAL_MEMORY`

The maximum value of `TOTAL_MEMORY` seen during the thread execution.

- `TELEMETRY_ACTIVE`

Whether the thread has an active telemetry session attached. The value is YES or NO.

The `threads` table has these indexes:

- Primary key on (`THREAD_ID`)
- Index on (`NAME`)
- Index on (`PROCESSLIST_ID`)
- Index on (`PROCESSLIST_USER`, `PROCESSLIST_HOST`)
- Index on (`PROCESSLIST_HOST`)
- Index on (`THREAD_OS_ID`)
- Index on (`RESOURCE_GROUP`)

`TRUNCATE TABLE` is not permitted for the `threads` table.

### 29.12.22.9 The `tls_channel_status` Table

Connection interface TLS properties are set at server startup, and can be updated at runtime using the `ALTER INSTANCE RELOAD TLS` statement. See [Server-Side Runtime Configuration and Monitoring for Encrypted Connections](#).

The `tls_channel_status` table provides information about connection interface TLS properties:

```
mysql> SELECT * FROM performance_schema.tls_channel_status\G
***** 1. row *****
CHANNEL: mysql_main
PROPERTY: Enabled
 VALUE: Yes
***** 2. row *****
CHANNEL: mysql_main
PROPERTY: ssl_accept_renegotiates
 VALUE: 0
***** 3. row *****
CHANNEL: mysql_main
PROPERTY: Ssl_accepts
 VALUE: 2
...
***** 29. row *****
CHANNEL: mysql_admin
PROPERTY: Enabled
 VALUE: No
***** 30. row *****
CHANNEL: mysql_admin
PROPERTY: ssl_accept_renegotiates
 VALUE: 0
***** 31. row *****
CHANNEL: mysql_admin
PROPERTY: Ssl_accepts
 VALUE: 0
...
```

The `tls_channel_status` table has these columns:

- `CHANNEL`

The name of the connection interface to which the TLS property row applies. `mysql_main` and `mysql_admin` are the channel names for the main and administrative connection interfaces, respectively. For information about the different interfaces, see [Section 7.1.12.1, “Connection Interfaces”](#).

- `PROPERTY`

The TLS property name. The row for the `Enabled` property indicates overall interface status, where the interface and its status are named in the `CHANNEL` and `VALUE` columns, respectively. Other property names indicate particular TLS properties. These often correspond to the names of TLS-related status variables.

- `VALUE`

The TLS property value.

The properties exposed by this table are not fixed and depend on the instrumentation implemented by each channel.

For each channel, the row with a `PROPERTY` value of `Enabled` indicates whether the channel supports encrypted connections, and other channel rows indicate TLS context properties:

- For `mysql_main`, the `Enabled` property is `yes` or `no` to indicate whether the main interface supports encrypted connections. Other channel rows display TLS context properties for the main interface.

For the main interface, similar status information can be obtained using these statements:

```
SHOW GLOBAL STATUS LIKE 'current_tls%';
SHOW GLOBAL STATUS LIKE 'ssl%';
```

- For `mysql_admin`, the `Enabled` property is `no` if the administrative interface is not enabled or it is enabled but does not support encrypted connections. `Enabled` is `yes` if the interface is enabled and supports encrypted connections.

When `Enabled` is `yes`, the other `mysql_admin` rows indicate channel properties for the administrative interface TLS context only if some nondefault TLS parameter value is configured for that interface. (This is the case if any `admin_tls_xxx` or `admin_ssl_xxx` system variable is set to a value different from its default.) Otherwise, the administrative interface uses the same TLS context as the main interface.

The `tls_channel_status` table has no indexes.

`TRUNCATE TABLE` is not permitted for the `tls_channel_status` table.

### 29.12.22.10 The `user_defined_functions` Table

The `user_defined_functions` table contains a row for each loadable function registered automatically by a component or plugin, or manually by a `CREATE FUNCTION` statement. For information about operations that add or remove table rows, see [Section 7.7.1, “Installing and Uninstalling Loadable Functions”](#).

#### Note

The name of the `user_defined_functions` table stems from the terminology used at its inception for the type of function now known as a loadable function (that is, user-defined function, or UDF).

The `user_defined_functions` table has these columns:

- `UDF_NAME`

The function name as referred to in SQL statements. The value is `NULL` if the function was registered by a `CREATE FUNCTION` statement and is in the process of unloading.

- `UDF_RETURN_TYPE`

The function return value type. The value is one of `int`, `decimal`, `real`, `char`, or `row`.

- `UDF_TYPE`

The function type. The value is one of [function](#) (scalar) or [aggregate](#).

- [UDF\\_LIBRARY](#)

The name of the library file containing the executable function code. The file is located in the directory named by the [plugin\\_dir](#) system variable. The value is [NULL](#) if the function was registered by a component or plugin rather than by a [CREATE FUNCTION](#) statement.

- [UDF\\_USAGE\\_COUNT](#)

The current function usage count. This is used to tell whether statements currently are accessing the function.

The [user\\_defined\\_functions](#) table has these indexes:

- Primary key on ([UDF\\_NAME](#))

[TRUNCATE TABLE](#) is not permitted for the [user\\_defined\\_functions](#) table.

The [mysql.func](#) system table also lists installed loadable functions, but only those installed using [CREATE FUNCTION](#). The [user\\_defined\\_functions](#) table lists loadable functions installed using [CREATE FUNCTION](#) as well as loadable functions installed automatically by components or plugins. This difference makes [user\\_defined\\_functions](#) preferable to [mysql.func](#) for checking which loadable functions are installed.

## 29.13 Performance Schema Option and Variable Reference

Table 29.16 Performance Schema Variable Reference

Name	Cmd-Line	Option File	System Var	Status Var	Var Scope	Dynamic

## 29.14 Performance Schema Command Options

Performance Schema parameters can be specified at server startup on the command line or in option files to configure Performance Schema instruments and consumers. Runtime configuration is also possible in many cases (see [Section 29.4, “Performance Schema Runtime Configuration”](#)), but startup configuration must be used when runtime configuration is too late to affect instruments that have already been initialized during the startup process.

Performance Schema consumers and instruments can be configured at startup using the following syntax. For additional details, see [Section 29.3, “Performance Schema Startup Configuration”](#).

- `--performance-schema-consumer-consumer_name=value`

Configure a Performance Schema consumer. Consumer names in the `setup_consumers` table use underscores, but for consumers set at startup, dashes and underscores within the name are equivalent. Options for configuring individual consumers are detailed later in this section.

- `--performance-schema-instrument=instrument_name=value`

Configure a Performance Schema instrument. The name may be given as a pattern to configure instruments that match the pattern.

The following items configure individual consumers:

- `--performance-schema-consumer-events-stages-current=value`

Configure the `events-stages-current` consumer.

- `--performance-schema-consumer-events-stages-history=value`

Configure the `events-stages-history` consumer.

- `--performance-schema-consumer-events-stages-history-long=value`

Configure the `events-stages-history-long` consumer.

- `--performance-schema-consumer-events-statements-cpu=value`

Configure the `events-statements-cpu` consumer.

- `--performance-schema-consumer-events-statements-current=value`

Configure the `events-statements-current` consumer.

- `--performance-schema-consumer-events-statements-history=value`

Configure the `events-statements-history` consumer.

- `--performance-schema-consumer-events-statements-history-long=value`

Configure the `events-statements-history-long` consumer.

- `--performance-schema-consumer-events-transactions-current=value`

Configure the Performance Schema `events-transactions-current` consumer.

- `--performance-schema-consumer-events-transactions-history=value`

Configure the Performance Schema `events-transactions-history` consumer.

- `--performance-schema-consumer-events-transactions-history-long=value`

Configure the Performance Schema `events-transactions-history-long` consumer.

- `--performance-schema-consumer-events-waits-current=value`  
Configure the `events-waits-current` consumer.
- `--performance-schema-consumer-events-waits-history=value`  
Configure the `events-waits-history` consumer.
- `--performance-schema-consumer-events-waits-history-long=value`  
Configure the `events-waits-history-long` consumer.
- `--performance-schema-consumer-global-instrumentation=value`  
Configure the `global-instrumentation` consumer.
- `--performance-schema-consumer-statements-digest=value`  
Configure the `statements-digest` consumer.
- `--performance-schema-consumer-thread-instrumentation=value`  
Configure the `thread-instrumentation` consumer.

## 29.15 Performance Schema System Variables

The Performance Schema implements several system variables that provide configuration information:

Variable_name	Value
performance_schema	ON
performance_schema_accounts_size	-1
performance_schema_digests_size	10000
performance_schema_error_size	5377
performance_schema_events_stages_history_long_size	10000
performance_schema_events_stages_history_size	10
performance_schema_events_statements_history_long_size	10000
performance_schema_events_statements_history_size	10
performance_schema_events_transactions_history_long_size	10000
performance_schema_events_transactions_history_size	10
performance_schema_events_waits_history_long_size	10000
performance_schema_events_waits_history_size	10
performance_schema_hosts_size	-1
performance_schema_max_cond_classes	150
performance_schema_max_cond_instances	-1
performance_schema_max_digest_length	1024
performance_schema_max_digest_sample_age	60
performance_schema_max_file_classes	80
performance_schema_max_file_handles	32768
performance_schema_max_file_instances	-1
performance_schema_max_index_stat	-1
performance_schema_max_memory_classes	470
performance_schema_max_metadata_locks	-1
performance_schema_max_meter_classes	30
performance_schema_max_metric_classes	600
performance_schema_max_mutex_classes	350
performance_schema_max_mutex_instances	-1
performance_schema_max_prepared_statements_instances	-1
performance_schema_max_program_instances	-1
performance_schema_max_rwlock_classes	100
performance_schema_max_rwlock_instances	-1
performance_schema_max_socket_classes	10
performance_schema_max_socket_instances	-1
performance_schema_max_sql_text_length	1024
performance_schema_max_stage_classes	175
performance_schema_max_statement_classes	220

## Performance Schema System Variables

performance_schema_max_statement_stack	10
performance_schema_max_table_handles	-1
performance_schema_max_table_instances	-1
performance_schema_max_table_lock_stat	-1
performance_schema_max_thread_classes	100
performance_schema_max_thread_instances	-1
performance_schema_session_connect_attrs_size	512
performance_schema_setup_actors_size	-1
performance_schema_setup_objects_size	-1
performance_schema_show_processlist	OFF
performance_schema_users_size	-1

Performance Schema system variables can be set at server startup on the command line or in option files, and many can be set at runtime. See [Section 29.13, “Performance Schema Option and Variable Reference”](#).

The Performance Schema automatically sizes the values of several of its parameters at server startup if they are not set explicitly. For more information, see [Section 29.3, “Performance Schema Startup Configuration”](#).

Performance Schema system variables have the following meanings:

- `performance_schema`

Command-Line Format	<code>--performance-schema [= {OFF   ON}]</code>
System Variable	<code>performance_schema</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Boolean
Default Value	<code>ON</code>

The value of this variable is `ON` or `OFF` to indicate whether the Performance Schema is enabled. By default, the value is `ON`. At server startup, you can specify this variable with no value or a value of `ON` or 1 to enable it, or with a value of `OFF` or 0 to disable it.

Even when the Performance Schema is disabled, it continues to populate the `global_variables`, `session_variables`, `global_status`, and `session_status` tables. This occurs as necessary to permit the results for the `SHOW VARIABLES` and `SHOW STATUS` statements to be drawn from those tables. The Performance Schema also populates some of the replication tables when disabled.

- `performance_schema_accounts_size`

Command-Line Format	<code>--performance-schema-accounts-size=#</code>
System Variable	<code>performance_schema_accounts_size</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	<code>-1</code> (signifies autoscaling; do not assign this literal value)
Minimum Value	<code>-1</code> (signifies autoscaling; do not assign this literal value)
Maximum Value	<code>1048576</code>

The number of rows in the `accounts` table. If this variable is 0, the Performance Schema does not maintain connection statistics in the `accounts` table or status variable information in the `status_by_account` table.

- `performance_schema_digests_size`

Command-Line Format	<code>--performance-schema-digests-size=#</code>
System Variable	<code>performance_schema_digests_size</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	<code>-1</code> (signifies autosizing; do not assign this literal value)
Minimum Value	<code>-1</code> (signifies autoscaling; do not assign this literal value)
Maximum Value	<code>1048576</code>

The maximum number of rows in the `events_statements_summary_by_digest` table. If this maximum is exceeded such that a digest cannot be instrumented, the Performance Schema increments the `Performance_schema_digest_lost` status variable.

For more information about statement digesting, see [Section 29.10, “Performance Schema Statement Digests and Sampling”](#).

- `performance_schema_error_size`

Command-Line Format	<code>--performance-schema-error-size=#</code>
System Variable	<code>performance_schema_error_size</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	number of server error codes
Minimum Value	0
Maximum Value	<code>1048576</code>

The number of instrumented server error codes. The default value is the actual number of server error codes. Although the value can be set anywhere from 0 to its maximum, the intended use is to set it to either its default (to instrument all errors) or 0 (to instrument no errors).

Error information is aggregated in summary tables; see [Section 29.12.20.11, “Error Summary Tables”](#). If an error occurs that is not instrumented, information for the occurrence is aggregated to the `NULL` row in each summary table; that is, to the row with `ERROR_NUMBER=0`, `ERROR_NAME=NULL`, and `SQLSTATE=NULL`.

- `performance_schema_events_stages_history_long_size`

Command-Line Format	<code>--performance-schema-events-stages-history-long-size=#</code>
System Variable	<code>performance_schema_events_stages_history_lo</code>

Scope	Global
Dynamic	No
SET_VAR Hint Applies	No
Type	Integer
Default Value	-1 (signifies autosizing; do not assign this literal value)
Minimum Value	-1 (signifies autoscaling; do not assign this literal value)
Maximum Value	1048576

The number of rows in the `events_stages_history_long` table.

- `performance_schema_events_stages_history_size`

Command-Line Format	--performance-schema-events-stages-history-size=#
System Variable	<code>performance_schema_events_stages_history_size</code>
Scope	Global
Dynamic	No
SET_VAR Hint Applies	No
Type	Integer
Default Value	-1 (signifies autosizing; do not assign this literal value)
Minimum Value	-1 (signifies autoscaling; do not assign this literal value)
Maximum Value	1024

The number of rows per thread in the `events_stages_history` table.

- `performance_schema_events_statements_history_long_size`

Command-Line Format	--performance-schema-events-statements-history-long-size=#
System Variable	<code>performance_schema_events_statements_history_long_size</code>
Scope	Global
Dynamic	No
SET_VAR Hint Applies	No
Type	Integer
Default Value	-1 (signifies autosizing; do not assign this literal value)
Minimum Value	-1 (signifies autoscaling; do not assign this literal value)
Maximum Value	1048576

The number of rows in the `events_statements_history_long` table.

- `performance_schema_events_statements_history_size`

Command-Line Format	--performance-schema-events-statements-history-size=#
---------------------	-------------------------------------------------------

System Variable	<code>performance_schema_events_statements_history_long_size</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	<code>-1</code> (signifies autosizing; do not assign this literal value)
Minimum Value	<code>-1</code> (signifies autoscaling; do not assign this literal value)
Maximum Value	1024

The number of rows per thread in the `events_statements_history` table.

- `performance_schema_events_transactions_history_long_size`

Command-Line Format	<code>--performance-schema-events-transactions-history-long-size=#</code>
System Variable	<code>performance_schema_events_transactions_history_long_size</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	<code>-1</code> (signifies autosizing; do not assign this literal value)
Minimum Value	<code>-1</code> (signifies autoscaling; do not assign this literal value)
Maximum Value	1048576

The number of rows in the `events_transactions_history_long` table.

- `performance_schema_events_transactions_history_size`

Command-Line Format	<code>--performance-schema-events-transactions-history-size=#</code>
System Variable	<code>performance_schema_events_transactions_history_size</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	<code>-1</code> (signifies autosizing; do not assign this literal value)
Minimum Value	<code>-1</code> (signifies autoscaling; do not assign this literal value)
Maximum Value	1024

The number of rows per thread in the `events_transactions_history` table.

## Performance Schema System Variables

---

- `performance_schema_events_waits_history_long_size`

Command-Line Format	<code>--performance-schema-events-waits-history-long-size=#</code>
System Variable	<code>performance_schema_events_waits_history_long_size</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	<code>-1</code> (signifies autosizing; do not assign this literal value)
Minimum Value	<code>-1</code> (signifies autoscaling; do not assign this literal value)
Maximum Value	<code>1048576</code>

The number of rows in the `events_waits_history_long` table.

- `performance_schema_events_waits_history_size`

Command-Line Format	<code>--performance-schema-events-waits-history-size=#</code>
System Variable	<code>performance_schema_events_waits_history_size</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	<code>-1</code> (signifies autosizing; do not assign this literal value)
Minimum Value	<code>-1</code> (signifies autoscaling; do not assign this literal value)
Maximum Value	<code>1024</code>

The number of rows per thread in the `events_waits_history` table.

- `performance_schema_hosts_size`

Command-Line Format	<code>--performance-schema-hosts-size=#</code>
System Variable	<code>performance_schema_hosts_size</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	<code>-1</code> (signifies autoscaling; do not assign this literal value)
Minimum Value	<code>-1</code> (signifies autoscaling; do not assign this literal value)

Maximum Value	<b>1048576</b>
---------------	----------------

The number of rows in the `hosts` table. If this variable is 0, the Performance Schema does not maintain connection statistics in the `hosts` table or status variable information in the `status_by_host` table.

- `performance_schema_max_cond_classes`

Command-Line Format	<code>--performance-schema-max-cond-classes=#</code>
System Variable	<code>performance_schema_max_cond_classes</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	<code>150</code>
Minimum Value	<code>0</code>
Maximum Value	<code>1024</code>

The maximum number of condition instruments. For information about how to set and use this variable, see [Section 29.7, “Performance Schema Status Monitoring”](#).

- `performance_schema_max_cond_instances`

Command-Line Format	<code>--performance-schema-max-cond-instances=#</code>
System Variable	<code>performance_schema_max_cond_instances</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	<code>-1</code> (signifies autoscaling; do not assign this literal value)
Minimum Value	<code>-1</code> (signifies autoscaling; do not assign this literal value)
Maximum Value	<code>1048576</code>

The maximum number of instrumented condition objects. For information about how to set and use this variable, see [Section 29.7, “Performance Schema Status Monitoring”](#).

- `performance_schema_max_digest_length`

Command-Line Format	<code>--performance-schema-max-digest-length=#</code>
System Variable	<code>performance_schema_max_digest_length</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	<code>1024</code>

Minimum Value	0
Maximum Value	1048576
Unit	bytes

The maximum number of bytes of memory reserved per statement for computation of normalized statement digest values in the Performance Schema. This variable is related to `max_digest_length`; see the description of that variable in [Section 7.1.8, “Server System Variables”](#).

For more information about statement digesting, including considerations regarding memory use, see [Section 29.10, “Performance Schema Statement Digests and Sampling”](#).

- `performance_schema_max_digest_sample_age`

Command-Line Format	--performance-schema-max-digest-sample-age=#
System Variable	<code>performance_schema_max_digest_sample_age</code>
Scope	Global
Dynamic	Yes
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	60
Minimum Value	0
Maximum Value	1048576
Unit	seconds

This variable affects statement sampling for the `events_statements_summary_by_digest` table. When a new table row is inserted, the statement that produced the row digest value is stored as the current sample statement associated with the digest. Thereafter, when the server sees other statements with the same digest value, it determines whether to use the new statement to replace the current sample statement (that is, whether to resample). Resampling policy is based on the comparative wait times of the current sample statement and new statement and, optionally, the age of the current sample statement:

- Resampling based on wait times: If the new statement wait time has a wait time greater than that of the current sample statement, it becomes the current sample statement.
- Resampling based on age: If the `performance_schema_max_digest_sample_age` system variable has a value greater than zero and the current sample statement is more than that many seconds old, the current statement is considered “too old” and the new statement replaces it. This occurs even if the new statement wait time is less than that of the current sample statement.

For information about statement sampling, see [Section 29.10, “Performance Schema Statement Digests and Sampling”](#).

- `performance_schema_max_file_classes`

Command-Line Format	--performance-schema-max-file-classes=#
System Variable	<code>performance_schema_max_file_classes</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No

Type	Integer
Default Value	80
Minimum Value	0
Maximum Value	1024

The maximum number of file instruments. For information about how to set and use this variable, see [Section 29.7, “Performance Schema Status Monitoring”](#).

- [performance\\_schema\\_max\\_file\\_handles](#)

Command-Line Format	--performance-schema-max-file-handles=#
System Variable	<a href="#">performance_schema_max_file_handles</a>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	32768
Minimum Value	0
Maximum Value	1048576

The maximum number of opened file objects. For information about how to set and use this variable, see [Section 29.7, “Performance Schema Status Monitoring”](#).

The value of `performance_schema_max_file_handles` should be greater than the value of `open_files_limit`: `open_files_limit` affects the maximum number of open file handles the server can support and `performance_schema_max_file_handles` affects how many of these file handles can be instrumented.

- [performance\\_schema\\_max\\_file\\_instances](#)

Command-Line Format	--performance-schema-max-file-instances=#
System Variable	<a href="#">performance_schema_max_file_instances</a>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	-1 (signifies autoscaling; do not assign this literal value)
Minimum Value	-1 (signifies autoscaling; do not assign this literal value)
Maximum Value	1048576

The maximum number of instrumented file objects. For information about how to set and use this variable, see [Section 29.7, “Performance Schema Status Monitoring”](#).

- [performance\\_schema\\_max\\_index\\_stat](#)

Command-Line Format	--performance-schema-max-index-stat=#
	4949

System Variable	<code>performance_schema_max_index_stat</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	<code>-1</code> (signifies autosizing; do not assign this literal value)
Minimum Value	<code>-1</code> (signifies autoscaling; do not assign this literal value)
Maximum Value	<code>1048576</code>

The maximum number of indexes for which the Performance Schema maintains statistics. If this maximum is exceeded such that index statistics are lost, the Performance Schema increments the `Performance_schema_index_stat_lost` status variable. The default value is autosized using the value of `performance_schema_max_table_instances`.

- `performance_schema_max_memory_classes`

Command-Line Format	<code>--performance-schema-max-memory-classes=#</code>
System Variable	<code>performance_schema_max_memory_classes</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	<code>470</code>
Default Value	<code>450</code>
Minimum Value	<code>0</code>
Maximum Value	<code>1024</code>

The maximum number of memory instruments. For information about how to set and use this variable, see [Section 29.7, “Performance Schema Status Monitoring”](#).

- `performance_schema_max_metadata_locks`

Command-Line Format	<code>--performance-schema-max-metadata-locks=#</code>
System Variable	<code>performance_schema_max_metadata_locks</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	<code>-1</code> (signifies autoscaling; do not assign this literal value)
Minimum Value	<code>-1</code> (signifies autoscaling; do not assign this literal value)

Maximum Value	10485760
---------------	----------

The maximum number of metadata lock instruments. This value controls the size of the `metadata_locks` table. If this maximum is exceeded such that a metadata lock cannot be instrumented, the Performance Schema increments the `Performance_schema_metadata_lock_lost` status variable.

- `performance_schema_max_meter_classes`

Command-Line Format	--performance-schema-max-meter-classes=#
System Variable	<code>performance_schema_max_meter_classes</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	30
Minimum Value	0
Maximum Value	64

Maximum number of meter instruments which can be created

- `performance_schema_max_metric_classes`

Command-Line Format	--performance-schema-max-metric-classes=#
System Variable	<code>performance_schema_max_metric_classes</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	600
Minimum Value	30
Maximum Value	11000

Maximum number of metric instruments which can be created.

- `performance_schema_max_mutex_classes`

Command-Line Format	--performance-schema-max-mutex-classes=#
System Variable	<code>performance_schema_max_mutex_classes</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	350
Minimum Value	0

Maximum Value	1024
---------------	------

The maximum number of mutex instruments. For information about how to set and use this variable, see [Section 29.7, “Performance Schema Status Monitoring”](#).

- `performance_schema_max_mutex_instances`

Command-Line Format	<code>--performance-schema-max-mutex-instances=#</code>
System Variable	<code>performance_schema_max_mutex_instances</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	<code>-1</code> (signifies autoscaling; do not assign this literal value)
Minimum Value	<code>-1</code> (signifies autoscaling; do not assign this literal value)
Maximum Value	104857600

The maximum number of instrumented mutex objects. For information about how to set and use this variable, see [Section 29.7, “Performance Schema Status Monitoring”](#).

- `performance_schema_max_prepared_statements_instances`

Command-Line Format	<code>--performance-schema-max-prepared-statements-instances=#</code>
System Variable	<code>performance_schema_max_prepared_statements_instances</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	<code>-1</code> (signifies autoscaling; do not assign this literal value)
Minimum Value	<code>-1</code> (signifies autoscaling; do not assign this literal value)
Maximum Value	4194304

The maximum number of rows in the `prepared_statements_instances` table. If this maximum is exceeded such that a prepared statement cannot be instrumented, the Performance Schema increments the `Performance_schema_prepared_statements_lost` status variable. For information about how to set and use this variable, see [Section 29.7, “Performance Schema Status Monitoring”](#).

The default value of this variable is autosized based on the value of the `max_prepared_stmt_count` system variable.

- `performance_schema_max_rwlock_classes`

Command-Line Format	<code>--performance-schema-max-rwlock-classes=#</code>
System Variable	<code>performance_schema_max_rwlock_classes</code>

Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	100
Minimum Value	0
Maximum Value	1024

The maximum number of rwlock instruments. For information about how to set and use this variable, see [Section 29.7, “Performance Schema Status Monitoring”](#).

- `performance_schema_max_program_instances`

Command-Line Format	<code>--performance-schema-max-program-instances=#</code>
System Variable	<code>performance_schema_max_program_instances</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	-1 (signifies autoscaling; do not assign this literal value)
Minimum Value	-1 (signifies autoscaling; do not assign this literal value)
Maximum Value	1048576

The maximum number of stored programs for which the Performance Schema maintains statistics. If this maximum is exceeded, the Performance Schema increments the `Performance_schema_program_lost` status variable. For information about how to set and use this variable, see [Section 29.7, “Performance Schema Status Monitoring”](#).

- `performance_schema_max_rwlock_instances`

Command-Line Format	<code>--performance-schema-max-rwlock-instances=#</code>
System Variable	<code>performance_schema_max_rwlock_instances</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	-1 (signifies autosizing; do not assign this literal value)
Minimum Value	-1 (signifies autosizing; do not assign this literal value)
Maximum Value	104857600

The maximum number of instrumented rwlock objects. For information about how to set and use this variable, see [Section 29.7, “Performance Schema Status Monitoring”](#).

- `performance_schema_max_socket_classes`

Command-Line Format	<code>--performance-schema-max-socket-classes=#</code>
System Variable	<code>performance_schema_max_socket_classes</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	<code>10</code>
Minimum Value	<code>0</code>
Maximum Value	<code>1024</code>

The maximum number of socket instruments. For information about how to set and use this variable, see [Section 29.7, “Performance Schema Status Monitoring”](#).

- `performance_schema_max_socket_instances`

Command-Line Format	<code>--performance-schema-max-socket-instances=#</code>
System Variable	<code>performance_schema_max_socket_instances</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	<code>-1</code> (signifies autoscaling; do not assign this literal value)
Minimum Value	<code>-1</code> (signifies autoscaling; do not assign this literal value)
Maximum Value	<code>1048576</code>

The maximum number of instrumented socket objects. For information about how to set and use this variable, see [Section 29.7, “Performance Schema Status Monitoring”](#).

- `performance_schema_max_sql_text_length`

Command-Line Format	<code>--performance-schema-max-sql-text-length=#</code>
System Variable	<code>performance_schema_max_sql_text_length</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	<code>1024</code>
Minimum Value	<code>0</code>
Maximum Value	<code>1048576</code>

Unit	bytes
------	-------

The maximum number of bytes used to store SQL statements. The value applies to storage required for these columns:

- The `SQL_TEXT` column of the `events_statements_current`, `events_statements_history`, and `events_statements_history_long` statement event tables.
- The `QUERY_SAMPLE_TEXT` column of the `events_statements_summary_by_digest` summary table.

Any bytes in excess of `performance_schema_max_sql_text_length` are discarded and do not appear in the column. Statements differing only after that many initial bytes are indistinguishable in the column.

Decreasing the `performance_schema_max_sql_text_length` value reduces memory use but causes more statements to become indistinguishable if they differ only at the end. Increasing the value increases memory use but permits longer statements to be distinguished.

- `performance_schema_max_stage_classes`

Command-Line Format	<code>--performance-schema-max-stage-classes=#</code>
System Variable	<code>performance_schema_max_stage_classes</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	175
Minimum Value	0
Maximum Value	1024

The maximum number of stage instruments. For information about how to set and use this variable, see [Section 29.7, “Performance Schema Status Monitoring”](#).

- `performance_schema_max_statement_classes`

Command-Line Format	<code>--performance-schema-max-statement-classes=#</code>
System Variable	<code>performance_schema_max_statement_classes</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Minimum Value	0

Maximum Value	256
---------------	-----

The maximum number of statement instruments. For information about how to set and use this variable, see [Section 29.7, “Performance Schema Status Monitoring”](#).

The default value is calculated at server build time based on the number of commands in the client/server protocol and the number of SQL statement types supported by the server.

This variable should not be changed, unless to set it to 0 to disable all statement instrumentation and save all memory associated with it. Setting the variable to nonzero values other than the default has no benefit; in particular, values larger than the default cause more memory to be allocated than is needed.

- [performance\\_schema\\_max\\_statement\\_stack](#)

Command-Line Format	--performance-schema-max-statement-stack=#
System Variable	<a href="#">performance_schema_max_statement_stack</a>
Scope	Global
Dynamic	No
<a href="#">SET_VAR</a> Hint Applies	No
Type	Integer
Default Value	10
Minimum Value	1
Maximum Value	256

The maximum depth of nested stored program calls for which the Performance Schema maintains statistics. When this maximum is exceeded, the Performance Schema increments the [Performance\\_schema\\_nested\\_statement\\_lost](#) status variable for each stored program statement executed.

- [performance\\_schema\\_max\\_table\\_handles](#)

Command-Line Format	--performance-schema-max-table-handles=#
System Variable	<a href="#">performance_schema_max_table_handles</a>
Scope	Global
Dynamic	No
<a href="#">SET_VAR</a> Hint Applies	No
Type	Integer
Default Value	-1 (signifies autoscaling; do not assign this literal value)
Minimum Value	-1 (signifies autoscaling; do not assign this literal value)
Maximum Value	1048576

The maximum number of opened table objects. This value controls the size of the [table\\_handles](#) table. If this maximum is exceeded such that a table handle cannot be instrumented, the Performance Schema increments the [Performance\\_schema\\_table\\_handles\\_lost](#) status variable. For information about how to set and use this variable, see [Section 29.7, “Performance Schema Status Monitoring”](#).

- [performance\\_schema\\_max\\_table\\_instances](#)

Command-Line Format	<code>--performance-schema-max-table-instances=#</code>
System Variable	<code>performance_schema_max_table_instances</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	<code>-1</code> (signifies autoscaling; do not assign this literal value)
Minimum Value	<code>-1</code> (signifies autoscaling; do not assign this literal value)
Maximum Value	<code>1048576</code>

The maximum number of instrumented table objects. For information about how to set and use this variable, see [Section 29.7, “Performance Schema Status Monitoring”](#).

- `performance_schema_max_table_lock_stat`

Command-Line Format	<code>--performance-schema-max-table-lock-stat=#</code>
System Variable	<code>performance_schema_max_table_lock_stat</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	<code>-1</code> (signifies autosizing; do not assign this literal value)
Minimum Value	<code>-1</code> (signifies autoscaling; do not assign this literal value)
Maximum Value	<code>1048576</code>

The maximum number of tables for which the Performance Schema maintains lock statistics. If this maximum is exceeded such that table lock statistics are lost, the Performance Schema increments the `Performance_schema_table_lock_stat_lost` status variable.

- `performance_schema_max_thread_classes`

Command-Line Format	<code>--performance-schema-max-thread-classes=#</code>
System Variable	<code>performance_schema_max_thread_classes</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	<code>100</code>
Minimum Value	<code>0</code>

Maximum Value	1024
---------------	------

The maximum number of thread instruments. For information about how to set and use this variable, see [Section 29.7, “Performance Schema Status Monitoring”](#).

- `performance_schema_max_thread_instances`

Command-Line Format	<code>--performance-schema-max-thread-instances=#</code>
System Variable	<code>performance_schema_max_thread_instances</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	<code>-1</code> (signifies autosizing; do not assign this literal value)
Minimum Value	<code>-1</code> (signifies autoscaling; do not assign this literal value)
Maximum Value	1048576

The maximum number of instrumented thread objects. The value controls the size of the `threads` table. If this maximum is exceeded such that a thread cannot be instrumented, the Performance Schema increments the `Performance_schema_thread_instances_lost` status variable. For information about how to set and use this variable, see [Section 29.7, “Performance Schema Status Monitoring”](#).

The `max_connections` system variable affects how many threads can run in the server. `performance_schema_max_thread_instances` affects how many of these running threads can be instrumented.

The `variables_by_thread` and `status_by_thread` tables contain system and status variable information only about foreground threads. If not all threads are instrumented by the Performance Schema, this table misses some rows. In this case, the `Performance_schema_thread_instances_lost` status variable is greater than zero.

- `performance_schema_session_connect_attrs_size`

Command-Line Format	<code>--performance-schema-session-connect-attrs-size=#</code>
System Variable	<code>performance_schema_session_connect_attrs_size</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	<code>-1</code> (signifies autosizing; do not assign this literal value)
Minimum Value	<code>-1</code> (signifies autosizing; do not assign this literal value)
Maximum Value	1048576

Unit	bytes
------	-------

The amount of preallocated memory per thread reserved to hold connection attribute key-value pairs. If the aggregate size of connection attribute data sent by a client is larger than this amount, the Performance Schema truncates the attribute data, increments the `Performance_schema_session_connect_attrs_lost` status variable, and writes a message to the error log indicating that truncation occurred if the `log_error_verbosity` system variable is greater than 1. A `_truncated` attribute is also added to the session attributes with a value indicating how many bytes were lost, if the attribute buffer has sufficient space. This enables the Performance Schema to expose per-connection truncation information in the connection attribute tables. This information can be examined without having to check the error log.

The default value of `performance_schema_session_connect_attrs_size` is autosized at server startup. This value may be small, so if truncation occurs (`Performance_schema_session_connect_attrs_lost` becomes nonzero), you may wish to set `performance_schema_session_connect_attrs_size` explicitly to a larger value.

Although the maximum permitted `performance_schema_session_connect_attrs_size` value is 1MB, the effective maximum is 64KB because the server imposes a limit of 64KB on the aggregate size of connection attribute data it accepts. If a client attempts to send more than 64KB of attribute data, the server rejects the connection. For more information, see [Section 29.12.9, “Performance Schema Connection Attribute Tables”](#).

- `performance_schema_setup_actors_size`

Command-Line Format	<code>--performance-schema-setup-actors-size=#</code>
System Variable	<code>performance_schema_setup_actors_size</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	<code>-1</code> (signifies autoscaling; do not assign this literal value)
Minimum Value	<code>-1</code> (signifies autosizing; do not assign this literal value)
Maximum Value	<code>1048576</code>

The number of rows in the `setup_actors` table.

- `performance_schema_setup_objects_size`

Command-Line Format	<code>--performance-schema-setup-objects-size=#</code>
System Variable	<code>performance_schema_setup_objects_size</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	<code>-1</code> (signifies autoscaling; do not assign this literal value)
Minimum Value	<code>-1</code> (signifies autoscaling; do not assign this literal value)

Maximum Value	1048576
---------------	---------

The number of rows in the `setup_objects` table.

- `performance_schema_show_processlist`

Command-Line Format	<code>--performance-schema-show-processlist[={OFF ON}]</code>
Deprecated	Yes
System Variable	<code>performance_schema_show_processlist</code>
Scope	Global
Dynamic	Yes
<code>SET_VAR</code> Hint Applies	No
Type	Boolean
Default Value	<code>OFF</code>

The `SHOW PROCESSLIST` statement provides process information by collecting thread data from all active threads. The `performance_schema_show_processlist` variable determines which `SHOW PROCESSLIST` implementation to use:

- The default implementation iterates across active threads from within the thread manager while holding a global mutex. This has negative performance consequences, particularly on busy systems.
- The alternative `SHOW PROCESSLIST` implementation is based on the Performance Schema `processlist` table. This implementation queries active thread data from the Performance Schema rather than the thread manager and does not require a mutex.

To enable the alternative implementation, enable the `performance_schema_show_processlist` system variable. To ensure that the default and alternative implementations yield the same information, certain configuration requirements must be met; see [Section 29.12.22.7, “The processlist Table”](#).

- `performance_schema_users_size`

Command-Line Format	<code>--performance-schema-users-size=#</code>
System Variable	<code>performance_schema_users_size</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	<code>-1</code> (signifies autoscaling; do not assign this literal value)
Minimum Value	<code>-1</code> (signifies autoscaling; do not assign this literal value)
Maximum Value	1048576

The number of rows in the `users` table. If this variable is 0, the Performance Schema does not maintain connection statistics in the `users` table or status variable information in the `status_by_user` table.

## 29.16 Performance Schema Status Variables

The Performance Schema implements several status variables that provide information about instrumentation that could not be loaded or created due to memory constraints:

Variable_name	Value
Performance_schema_accounts_lost	0
Performance_schema_cond_classes_lost	0
Performance_schema_cond_instances_lost	0
Performance_schema_digest_lost	0
Performance_schema_file_classes_lost	0
Performance_schema_file_handles_lost	0
Performance_schema_file_instances_lost	0
Performance_schema_hosts_lost	0
Performance_schema_index_stat_lost	0
Performance_schema_locker_lost	0
Performance_schema_memory_classes_lost	0
Performance_schema_metadata_lock_lost	0
Performance_schema_meter_lost	0
Performance_schema_metric_lost	0
Performance_schema_mutex_classes_lost	0
Performance_schema_mutex_instances_lost	0
Performance_schema_nested_statement_lost	0
Performance_schema_prepared_statements_lost	0
Performance_schema_program_lost	0
Performance_schema_rwlock_classes_lost	0
Performance_schema_rwlock_instances_lost	0
Performance_schema_session_connect_attrs_longest_seen	131
Performance_schema_session_connect_attrs_lost	0
Performance_schema_socket_classes_lost	0
Performance_schema_socket_instances_lost	0
Performance_schema_stage_classes_lost	0
Performance_schema_statement_classes_lost	0
Performance_schema_table_handles_lost	0
Performance_schema_table_instances_lost	0
Performance_schema_table_lock_stat_lost	0
Performance_schema_thread_classes_lost	0
Performance_schema_thread_instances_lost	0
Performance_schema_users_lost	0

For information on using these variables to check Performance Schema status, see [Section 29.7, “Performance Schema Status Monitoring”](#).

Performance Schema status variables have the following meanings:

- [Performance\\_schema\\_accounts\\_lost](#)

The number of times a row could not be added to the `accounts` table because it was full.

- [Performance\\_schema\\_cond\\_classes\\_lost](#)

How many condition instruments could not be loaded.

- [Performance\\_schema\\_cond\\_instances\\_lost](#)

How many condition instrument instances could not be created.

- [Performance\\_schema\\_digest\\_lost](#)

The number of digest instances that could not be instrumented in the `events_statements_summary_by_digest` table. This can be nonzero if the value of `performance_schema_digests_size` is too small.

- [Performance\\_schema\\_file\\_classes\\_lost](#)

How many file instruments could not be loaded.

- [Performance\\_schema\\_file\\_handles\\_lost](#)

How many file instrument instances could not be opened.

- [Performance\\_schema\\_file\\_instances\\_lost](#)

How many file instrument instances could not be created.

- [Performance\\_schema\\_hosts\\_lost](#)

The number of times a row could not be added to the `hosts` table because it was full.

- [Performance\\_schema\\_index\\_stat\\_lost](#)

The number of indexes for which statistics were lost. This can be nonzero if the value of `performance_schema_max_index_stat` is too small.

- [Performance\\_schema\\_locker\\_lost](#)

How many events are “lost” or not recorded, due to the following conditions:

- Events are recursive (for example, waiting for A caused a wait on B, which caused a wait on C).
- The depth of the nested events stack is greater than the limit imposed by the implementation.

Events recorded by the Performance Schema are not recursive, so this variable should always be 0.

- [Performance\\_schema\\_memory\\_classes\\_lost](#)

The number of times a memory instrument could not be loaded.

- [Performance\\_schema\\_metadata\\_lock\\_lost](#)

The number of metadata locks that could not be instrumented in the `metadata_locks` table. This can be nonzero if the value of `performance_schema_max_metadata_locks` is too small.

- [Performance\\_schema\\_meter\\_lost](#)

Number of meter instruments that failed to be created.

- [Performance\\_schema\\_metric\\_lost](#)

Number of metric instruments that failed to be created.

- [Performance\\_schema\\_mutex\\_classes\\_lost](#)

How many mutex instruments could not be loaded.

- [Performance\\_schema\\_mutex\\_instances\\_lost](#)

How many mutex instrument instances could not be created.

- [Performance\\_schema\\_nested\\_statement\\_lost](#)

The number of stored program statements for which statistics were lost. This can be nonzero if the value of `performance_schema_max_statement_stack` is too small.

- [Performance\\_schema\\_prepared\\_statements\\_lost](#)

The number of prepared statements that could not be instrumented in the `prepared_statements_instances` table. This can be nonzero if the value of `performance_schema_max_prepared_statements_instances` is too small.

- [Performance\\_schema\\_program\\_lost](#)

The number of stored programs for which statistics were lost. This can be nonzero if the value of [performance\\_schema\\_max\\_program\\_instances](#) is too small.

- [Performance\\_schema\\_rwlock\\_classes\\_lost](#)

How many rwlock instruments could not be loaded.

- [Performance\\_schema\\_rwlock\\_instances\\_lost](#)

How many rwlock instrument instances could not be created.

- [Performance\\_schema\\_session\\_connect\\_attrs\\_longest\\_seen](#)

In addition to the connection attribute size-limit check performed by the Performance Schema against the value of the [performance\\_schema\\_session\\_connect\\_attrs\\_size](#) system variable, the server performs a preliminary check, imposing a limit of 64KB on the aggregate size of connection attribute data it accepts. If a client attempts to send more than 64KB of attribute data, the server rejects the connection. Otherwise, the server considers the attribute buffer valid and tracks the size of the longest such buffer in the [Performance\\_schema\\_session\\_connect\\_attrs\\_longest\\_seen](#) status variable. If this value is larger than [performance\\_schema\\_session\\_connect\\_attrs\\_size](#), DBAs may wish to increase the latter value, or, alternatively, investigate which clients are sending large amounts of attribute data.

For more information about connection attributes, see [Section 29.12.9, “Performance Schema Connection Attribute Tables”](#).

- [Performance\\_schema\\_session\\_connect\\_attrs\\_lost](#)

The number of connections for which connection attribute truncation has occurred.

For a given connection, if the client sends connection attribute key-value pairs for which the aggregate size is larger than the reserved storage permitted by the value of the [performance\\_schema\\_session\\_connect\\_attrs\\_size](#) system variable, the Performance Schema truncates the attribute data and increments [Performance\\_schema\\_session\\_connect\\_attrs\\_lost](#). If this value is nonzero, you may wish to set [performance\\_schema\\_session\\_connect\\_attrs\\_size](#) to a larger value.

For more information about connection attributes, see [Section 29.12.9, “Performance Schema Connection Attribute Tables”](#).

- [Performance\\_schema\\_socket\\_classes\\_lost](#)

How many socket instruments could not be loaded.

- [Performance\\_schema\\_socket\\_instances\\_lost](#)

How many socket instrument instances could not be created.

- [Performance\\_schema\\_stage\\_classes\\_lost](#)

How many stage instruments could not be loaded.

- [Performance\\_schema\\_statement\\_classes\\_lost](#)

How many statement instruments could not be loaded.

- [Performance\\_schema\\_table\\_handles\\_lost](#)

How many table instrument instances could not be opened. This can be nonzero if the value of [performance\\_schema\\_max\\_table\\_handles](#) is too small.

- [Performance\\_schema\\_table\\_instances\\_lost](#)

How many table instrument instances could not be created.

- [Performance\\_schema\\_table\\_lock\\_stat\\_lost](#)

The number of tables for which lock statistics were lost. This can be nonzero if the value of [performance\\_schema\\_max\\_table\\_lock\\_stat](#) is too small.

- [Performance\\_schema\\_thread\\_classes\\_lost](#)

How many thread instruments could not be loaded.

- [Performance\\_schema\\_thread\\_instances\\_lost](#)

The number of thread instances that could not be instrumented in the [threads](#) table. This can be nonzero if the value of [performance\\_schema\\_max\\_thread\\_instances](#) is too small.

- [Performance\\_schema\\_users\\_lost](#)

The number of times a row could not be added to the [users](#) table because it was full.

## 29.17 The Performance Schema Memory-Allocation Model

The Performance Schema uses this memory allocation model:

- May allocate memory at server startup
- May allocate additional memory during server operation
- Never free memory during server operation (although it might be recycled)
- Free all memory used at shutdown

The result is to relax memory constraints so that the Performance Schema can be used with less configuration, and to decrease the memory footprint so that consumption scales with server load. Memory used depends on the load actually seen, not the load estimated or explicitly configured for.

Several Performance Schema sizing parameters are autoscaled and need not be configured explicitly unless you want to establish an explicit limit on memory allocation:

```
performance_schema_accounts_size
performance_schema_hosts_size
performance_schema_max_cond_instances
performance_schema_max_file_instances
performance_schema_max_index_stat
performance_schema_max_metadata_locks
performance_schema_max_mutex_instances
performance_schema_max_prepared_statements_instances
performance_schema_max_program_instances
performance_schema_max_rwlock_instances
performance_schema_max_socket_instances
performance_schema_max_table_handles
performance_schema_max_table_instances
performance_schema_max_table_lock_stat
performance_schema_max_thread_instances
performance_schema_users_size
```

For an autoscaled parameter, configuration works like this:

- With the value set to -1 (the default), the parameter is autoscaled:
  - The corresponding internal buffer is empty initially and no memory is allocated.
  - As the Performance Schema collects data, memory is allocated in the corresponding buffer. The buffer size is unbounded, and may grow with the load.

- With the value set to 0:
  - The corresponding internal buffer is empty initially and no memory is allocated.
- With the value set to  $N > 0$ :
  - The corresponding internal buffer is empty initially and no memory is allocated.
  - As the Performance Schema collects data, memory is allocated in the corresponding buffer, until the buffer size reaches  $N$ .
  - Once the buffer size reaches  $N$ , no more memory is allocated. Data collected by the Performance Schema for this buffer is lost, and any corresponding “lost instance” counters are incremented.

To see how much memory the Performance Schema is using, check the instruments designed for that purpose. The Performance Schema allocates memory internally and associates each buffer with a dedicated instrument so that memory consumption can be traced to individual buffers. Instruments named with the prefix `memory/performance_schema/` expose how much memory is allocated for these internal buffers. The buffers are global to the server, so the instruments are displayed only in the `memory_summary_global_by_event_name` table, and not in other `memory_summary_by_xxx_by_event_name` tables.

This query shows the information associated with the memory instruments:

```
SELECT * FROM performance_schema.memory_summary_global_by_event_name
WHERE EVENT_NAME LIKE 'memory/performance_schema/%';
```

## 29.18 Performance Schema and Plugins

Removing a plugin with `UNINSTALL PLUGIN` does not affect information already collected for code in that plugin. Time spent executing the code while the plugin was loaded was still spent even if the plugin is unloaded later. The associated event information, including aggregate information, remains readable in `performance_schema` database tables. For additional information about the effect of plugin installation and removal, see [Section 29.7, “Performance Schema Status Monitoring”](#).

A plugin implementor who instruments plugin code should document its instrumentation characteristics to enable those who load the plugin to account for its requirements. For example, a third-party storage engine should include in its documentation how much memory the engine needs for mutex and other instruments.

## 29.19 Using the Performance Schema to Diagnose Problems

The Performance Schema is a tool to help a DBA do performance tuning by taking real measurements instead of “wild guesses.” This section demonstrates some ways to use the Performance Schema for this purpose. The discussion here relies on the use of event filtering, which is described in [Section 29.4.2, “Performance Schema Event Filtering”](#).

The following example provides one methodology that you can use to analyze a repeatable problem, such as investigating a performance bottleneck. To begin, you should have a repeatable use case where performance is deemed “too slow” and needs optimization, and you should enable all instrumentation (no pre-filtering at all).

1. Run the use case.
2. Using the Performance Schema tables, analyze the root cause of the performance problem. This analysis relies heavily on post-filtering.
3. For problem areas that are ruled out, disable the corresponding instruments. For example, if analysis shows that the issue is not related to file I/O in a particular storage engine, disable the file I/O instruments for that engine. Then truncate the history and summary tables to remove previously collected events.

---

4. Repeat the process at step 1.

With each iteration, the Performance Schema output, particularly the `events_waits_history_long` table, contains less and less “noise” caused by nonsignificant instruments, and given that this table has a fixed size, contains more and more data relevant to the analysis of the problem at hand.

With each iteration, investigation should lead closer and closer to the root cause of the problem, as the “signal/noise” ratio improves, making analysis easier.

5. Once a root cause of performance bottleneck is identified, take the appropriate corrective action, such as:
  - Tune the server parameters (cache sizes, memory, and so forth).
  - Tune a query by writing it differently,
  - Tune the database schema (tables, indexes, and so forth).
  - Tune the code (this applies to storage engine or server developers only).
6. Start again at step 1, to see the effects of the changes on performance.

The `mutex_instances.LOCKED_BY_THREAD_ID` and `rwlock_instances.WRITE_LOCKED_BY_THREAD_ID` columns are extremely important for investigating performance bottlenecks or deadlocks. This is made possible by Performance Schema instrumentation as follows:

1. Suppose that thread 1 is stuck waiting for a mutex.
2. You can determine what the thread is waiting for:

```
SELECT * FROM performance_schema.events_waits_current
WHERE THREAD_ID = thread_1;
```

Say the query result identifies that the thread is waiting for mutex A, found in `events_waits_current.OBJECT_INSTANCE_BEGIN`.

3. You can determine which thread is holding mutex A:

```
SELECT * FROM performance_schema.mutex_instances
WHERE OBJECT_INSTANCE_BEGIN = mutex_A;
```

Say the query result identifies that it is thread 2 holding mutex A, as found in `mutex_instances.LOCKED_BY_THREAD_ID`.

4. You can see what thread 2 is doing:

```
SELECT * FROM performance_schema.events_waits_current
WHERE THREAD_ID = thread_2;
```

## 29.19.1 Query Profiling Using Performance Schema

The following example demonstrates how to use Performance Schema statement events and stage events to retrieve data comparable to profiling information provided by `SHOW PROFILES` and `SHOW PROFILE` statements.

The `setup_actors` table can be used to limit the collection of historical events by host, user, or account to reduce runtime overhead and the amount of data collected in history tables. The first step of the example shows how to limit collection of historical events to a specific user.

Performance Schema displays event timer information in picoseconds (trillionths of a second) to normalize timing data to a standard unit. In the following example, `TIMER_WAIT` values are divided

by 1000000000000 to show data in units of seconds. Values are also truncated to 6 decimal places to display data in the same format as `SHOW PROFILES` and `SHOW PROFILE` statements.

1. Limit the collection of historical events to the user that runs the query. By default, `setup_actors` is configured to allow monitoring and historical event collection for all foreground threads:

```
mysql> SELECT * FROM performance_schema.setup_actors;
+-----+-----+-----+-----+
| HOST | USER | ROLE | ENABLED | HISTORY |
+-----+-----+-----+-----+
| % | % | % | YES | YES |
+-----+-----+-----+-----+
```

Update the default row in the `setup_actors` table to disable historical event collection and monitoring for all foreground threads, and insert a new row that enables monitoring and historical event collection for the user that runs the query:

```
mysql> UPDATE performance_schema.setup_actors
 SET ENABLED = 'NO', HISTORY = 'NO'
 WHERE HOST = '%' AND USER = '%';

mysql> INSERT INTO performance_schema.setup_actors
 (HOST,USER,ROLE,ENABLED,HISTORY)
 VALUES('localhost','test_user','%','YES','YES');
```

Data in the `setup_actors` table should now appear similar to the following:

```
mysql> SELECT * FROM performance_schema.setup_actors;
+-----+-----+-----+-----+
| HOST | USER | ROLE | ENABLED | HISTORY |
+-----+-----+-----+-----+
| % | % | % | NO | NO |
| localhost | test_user | % | YES | YES |
+-----+-----+-----+-----+
```

2. Ensure that statement and stage instrumentation is enabled by updating the `setup_instruments` table. Some instruments may already be enabled by default.

```
mysql> UPDATE performance_schema.setup_instruments
 SET ENABLED = 'YES', TIMED = 'YES'
 WHERE NAME LIKE '%statement%';

mysql> UPDATE performance_schema.setup_instruments
 SET ENABLED = 'YES', TIMED = 'YES'
 WHERE NAME LIKE '%stage%';
```

3. Ensure that `events_statements_*` and `events_stages_*` consumers are enabled. Some consumers may already be enabled by default.

```
mysql> UPDATE performance_schema.setup_consumers
 SET ENABLED = 'YES'
 WHERE NAME LIKE '%events_statements_%';

mysql> UPDATE performance_schema.setup_consumers
 SET ENABLED = 'YES'
 WHERE NAME LIKE '%events_stages_%';
```

4. Under the user account you are monitoring, run the statement that you want to profile. For example:

```
mysql> SELECT * FROM employees.employees WHERE emp_no = 10001;
+-----+-----+-----+-----+
| emp_no | birth_date | first_name | last_name | gender | hire_date |
+-----+-----+-----+-----+
| 10001 | 1953-09-02 | Georgi | Facello | M | 1986-06-26 |
+-----+-----+-----+-----+
```

5. Identify the `EVENT_ID` of the statement by querying the `events_statements_history_long` table. This step is similar to running `SHOW PROFILES` to identify the `Query_ID`. The following query produces output similar to `SHOW PROFILES`:

```
mysql> SELECT EVENT_ID, TRUNCATE(TIMER_WAIT/1000000000000,6) as Duration, SQL_TEXT
 FROM performance_schema.events_statements_history_long WHERE SQL_TEXT like '%10001%';
+-----+-----+-----+
| event_id | duration | sql_text
+-----+-----+-----+
| 31 | 0.028310 | SELECT * FROM employees.employees WHERE emp_no = 10001 |
+-----+-----+-----+
```

6. Query the `events_stages_history_long` table to retrieve the statement's stage events. Stages are linked to statements using event nesting. Each stage event record has a `NESTING_EVENT_ID` column that contains the `EVENT_ID` of the parent statement.

```
mysql> SELECT event_name AS Stage, TRUNCATE(TIMER_WAIT/1000000000000,6) AS Duration
 FROM performance_schema.events_stages_history_long WHERE NESTING_EVENT_ID=31;
+-----+-----+
| Stage | Duration |
+-----+-----+
| stage/sql/starting | 0.000080 |
| stage/sql/checking permissions | 0.000005 |
| stage/sql/Opening tables | 0.027759 |
| stage/sql/init | 0.000052 |
| stage/sql/System lock | 0.000009 |
| stage/sql/optimizing | 0.000006 |
| stage/sql/statistics | 0.000082 |
| stage/sql/preparing | 0.000008 |
| stage/sql/executing | 0.000000 |
| stage/sql/Sending data | 0.000017 |
| stage/sql/end | 0.000001 |
| stage/sql/query end | 0.000004 |
| stage/sql/closing tables | 0.000006 |
| stage/sql/freeing items | 0.000272 |
| stage/sql/cleaning up | 0.000001 |
+-----+-----+
```

## 29.19.2 Obtaining Parent Event Information

The `data_locks` table shows data locks held and requested. Rows of this table have a `THREAD_ID` column indicating the thread ID of the session that owns the lock, and an `EVENT_ID` column indicating the Performance Schema event that caused the lock. Tuples of (`THREAD_ID, EVENT_ID`) values implicitly identify a parent event in other Performance Schema tables:

- The parent wait event in the `events_waits_xxx` tables
- The parent stage event in the `events_stages_xxx` tables
- The parent statement event in the `events_statements_xxx` tables
- The parent transaction event in the `events_transactions_current` table

To obtain details about the parent event, join the `THREAD_ID` and `EVENT_ID` columns with the columns of like name in the appropriate parent event table. The relation is based on a nested set data model, so the join has several clauses. Given parent and child tables represented by `parent` and `child`, respectively, the join looks like this:

```
WHERE
 parent.THREAD_ID = child.THREAD_ID /* 1 */
 AND parent.EVENT_ID < child.EVENT_ID /* 2 */
 AND (
 child.EVENT_ID <= parent.END_EVENT_ID /* 3a */
 OR parent.END_EVENT_ID IS NULL /* 3b */
)
```

The conditions for the join are:

1. The parent and child events are in the same thread.
2. The child event begins after the parent event, so its `EVENT_ID` value is greater than that of the parent.

3. The parent event has either completed or is still running.

To find lock information, `data_locks` is the table containing child events.

The `data_locks` table shows only existing locks, so these considerations apply regarding which table contains the parent event:

- For transactions, the only choice is `events_transactions_current`. If a transaction is completed, it may be in the transaction history tables, but the locks are gone already.
- For statements, it all depends on whether the statement that took a lock is a statement in a transaction that has already completed (use `events_statements_history`) or the statement is still running (use `events_statements_current`).
- For stages, the logic is similar to that for statements; use `events_stages_history` or `events_stages_current`.
- For waits, the logic is similar to that for statements; use `events_waits_history` or `events_waits_current`. However, so many waits are recorded that the wait that caused a lock is most likely gone from the history tables already.

Wait, stage, and statement events disappear quickly from the history. If a statement that executed a long time ago took a lock but is in a still-open transaction, it might not be possible to find the statement, but it is possible to find the transaction.

This is why the nested set data model works better for locating parent events. Following links in a parent/child relationship (data lock -> parent wait -> parent stage -> parent transaction) does not work well when intermediate nodes are already gone from the history tables.

The following scenario illustrates how to find the parent transaction of a statement in which a lock was taken:

Session A:

```
[1] START TRANSACTION;
[2] SELECT * FROM t1 WHERE pk = 1;
[3] SELECT 'Hello, world';
```

Session B:

```
SELECT ...
FROM performance_schema.events_transactions_current AS parent
 INNER JOIN performance_schema.data_locks AS child
WHERE
 parent.THREAD_ID = child.THREAD_ID
 AND parent.EVENT_ID < child.EVENT_ID
 AND (
 child.EVENT_ID <= parent.END_EVENT_ID
 OR parent.END_EVENT_ID IS NULL
);
```

The query for session B should show statement [2] as owning a data lock on the record with `pk=1`.

If session A executes more statements, [2] fades out of the history table.

The query should show the transaction that started in [1], regardless of how many statements, stages, or waits were executed.

To see more data, you can also use the `events_xxx_history_long` tables, except for transactions, assuming no other query runs in the server (so that history is preserved).

## 29.20 Restrictions on Performance Schema

The Performance Schema avoids using mutexes to collect or produce data, so there are no guarantees of consistency and results can sometimes be incorrect. Event values in `performance_schema` tables are nondeterministic and nonrepeatable.

If you save event information in another table, you should not assume that the original events remain available later. For example, if you select events from a `performance_schema` table into a temporary table, intending to join that table with the original table later, there might be no matches.

`mysqldump` and `BACKUP DATABASE` ignore tables in the `performance_schema` database.

Tables in the `performance_schema` database cannot be locked with `LOCK TABLES`, except the `setup_XXX` tables.

Tables in the `performance_schema` database cannot be indexed.

Tables in the `performance_schema` database are not replicated.

The types of timers might vary per platform. The `performance_timers` table shows which event timers are available. If the values in this table for a given timer name are `NULL`, that timer is not supported on your platform.

Instruments that apply to storage engines might not be implemented for all storage engines. Instrumentation of each third-party engine is the responsibility of the engine maintainer.

30.4.4 sys Schema Stored Procedures .....	5021
30.4.5 sys Schema Stored Functions .....	5039

MySQL 8.4 includes the `sys` schema, a set of objects that helps DBAs and developers interpret data collected by the Performance Schema. `sys` schema objects can be used for typical tuning and diagnosis use cases. Objects in this schema include:

- Views that summarize Performance Schema data into more easily understandable form.
- Stored procedures that perform operations such as Performance Schema configuration and generating diagnostic reports.
- Stored functions that query Performance Schema configuration and provide formatting services.

For new installations, the `sys` schema is installed by default during data directory initialization if you use `mysqld` with the `--initialize` or `--initialize-insecure` option. If this is not desired, you can drop the `sys` schema manually after initialization if it is unneeded.

The MySQL upgrade procedure produces an error if a `sys` schema exists but has no `version` view, on the assumption that absence of this view indicates a user-created `sys` schema. To upgrade in this case, remove or rename the existing `sys` schema first.

`sys` schema objects have a `DEFINER` of `'mysql.sys'@'localhost'`. Use of the dedicated `mysql.sys` account avoids problems that occur if a DBA renames or removes the `root` account.

## 30.1 Prerequisites for Using the sys Schema

Before using the `sys` schema, the prerequisites described in this section must be satisfied.

Because the `sys` schema provides an alternative means of accessing the Performance Schema, the Performance Schema must be enabled for the `sys` schema to work. See [Section 29.3, “Performance Schema Startup Configuration”](#).

For full access to the `sys` schema, a user must have these privileges:

- `SELECT` on all `sys` tables and views
- `EXECUTE` on all `sys` stored procedures and functions
- `INSERT` and `UPDATE` for the `sys_config` table, if changes are to be made to it
- Additional privileges for certain `sys` schema stored procedures and functions, as noted in their descriptions (for example, the `ps_setup_save()` procedure)

It is also necessary to have privileges for the objects underlying the `sys` schema objects:

- `SELECT` on any Performance Schema tables accessed by `sys` schema objects, and `UPDATE` for any tables to be updated using `sys` schema objects
- `PROCESS` for the `INFORMATION_SCHEMA INNODB_BUFFER_PAGE` table

Certain Performance Schema instruments and consumers must be enabled and (for instruments) timed to take full advantage of `sys` schema capabilities:

- All `wait` instruments
- All `stage` instruments
- All `statement` instruments
- `xxx_current` and `xxx_history_long` consumers for all events

You can use the `sys` schema itself to enable all of the additional instruments and consumers:

```
CALL sys.ps_setup_enable_instrument('wait');
CALL sys.ps_setup_enable_instrument('stage');
CALL sys.ps_setup_enable_instrument('statement');
CALL sys.ps_setup_enable_consumer('current');
CALL sys.ps_setup_enable_consumer('history_long');
```

#### Note

For many uses of the `sys` schema, the default Performance Schema is sufficient for data collection. Enabling all the instruments and consumers just mentioned has a performance impact, so it is preferable to enable only the additional configuration you need. Also, remember that if you enable additional configuration, you can easily restore the default configuration like this:

```
CALL sys.ps_setup_reset_to_default(TRUE);
```

## 30.2 Using the sys Schema

You can make the `sys` schema the default schema so that references to its objects need not be qualified with the schema name:

```
mysql> USE sys;
Database changed
mysql> SELECT * FROM version;
+-----+-----+
| sys_version | mysql_version |
+-----+-----+
| 2.1.1 | 8.4.0-tr |
+-----+-----+
```

(The `version` view shows the `sys` schema and MySQL server versions.)

To access `sys` schema objects while a different schema is the default (or simply to be explicit), qualify object references with the schema name:

```
mysql> SELECT * FROM sys.version;
+-----+-----+
| sys_version | mysql_version |
+-----+-----+
| 2.1.1 | 8.4.0-tr |
+-----+-----+
```

The `sys` schema contains many views that summarize Performance Schema tables in various ways. Most of these views come in pairs, such that one member of the pair has the same name as the other member, plus a `x$` prefix. For example, the `host_summary_by_file_io` view summarizes file I/O grouped by host and displays latencies converted from picoseconds to more readable values (with units);

```
mysql> SELECT * FROM sys.host_summary_by_file_io;
+-----+-----+-----+
| host | ios | io_latency |
+-----+-----+-----+
| localhost | 67570 | 5.38 s |
| background | 3468 | 4.18 s |
+-----+-----+-----+
```

```
+-----+-----+
| host | ios | io_latency |
+-----+-----+
| localhost | 67574 | 5380678125144 |
| background | 3474 | 4758696829416 |
+-----+-----+
```

The `x$host_summary_by_file_io` view summarizes the same data but displays unformatted picosecond latencies:

```
mysql> SELECT * FROM sys.x$host_summary_by_file_io;
+-----+-----+-----+
| host | ios | io_latency |
+-----+-----+-----+
| localhost | 67574 | 5380678125144 |
| background | 3474 | 4758696829416 |
+-----+-----+-----+
```

The view without the `x$` prefix is intended to provide output that is more user friendly and easier for humans to read. The view with the `x$` prefix that displays the same values in raw form is intended more for use with other tools that perform their own processing on the data. For additional information about the differences between non-`x$` and `x$` views, see [Section 30.4.3, “sys Schema Views”](#).

To examine `sys` schema object definitions, use the appropriate `SHOW` statement or `INFORMATION_SCHEMA` query. For example, to examine the definitions of the `session` view and `format_bytes()` function, use these statements:

```
mysql> SHOW CREATE VIEW sys.session;
mysql> SHOW CREATE FUNCTION sys.format_bytes;
```

However, those statements display the definitions in relatively unformatted form. To view object definitions with more readable formatting, access the individual `.sql` files found under the `scripts/sys_schema` directory in MySQL source distributions.

`mysqldump` does not dump the `sys` schema by default. To generate a dump file, name the `sys` schema explicitly on the command line using either of these commands:

```
mysqldump --databases --routines sys > sys_dump.sql
```

To reinstall the schema from the dump file, use this command:

```
mysql < sys_dump.sql
```

## 30.3 sys Schema Progress Reporting

The following `sys` schema views provide progress reporting for long-running transactions:

```
processlist
session
x$processlist
x$session
```

Assuming that the required instruments and consumers are enabled, the `progress` column of these views shows the percentage of work completed for stages that support progress reporting.

Stage progress reporting requires that the `events_stages_current` consumer be enabled, as well as the instruments for which progress information is desired. Instruments for these stages currently support progress reporting:

```
stage/sql/Copying to tmp table
stage/innodb/alter table (end)
stage/innodb/alter table (flush)
stage/innodb/alter table (insert)
stage/innodb/alter table (log apply index)
stage/innodb/alter table (log apply table)
stage/innodb/alter table (merge sort)
stage/innodb/alter table (read PK and internal sort)
stage/innodb/buffer pool load
```

For stages that do not support estimated and completed work reporting, or if the required instruments or consumers are not enabled, the `progress` column is `NULL`.

## 30.4 sys Schema Object Reference

The `sys` schema includes tables and triggers, views, and stored procedures and functions. The following sections provide details for each of these objects.

### 30.4.1 sys Schema Object Index

The following tables list `sys` schema objects and provide a short description of each one.

**Table 30.1 sys Schema Tables and Triggers**

Table or Trigger Name	Description
<code>sys_config</code>	sys schema configuration options table
<code>sys_config_insert_set_user</code>	sys_config insert trigger
<code>sys_config_update_set_user</code>	sys_config update trigger

**Table 30.2 sys Schema Views**

View Name	Description	Deprecated
<code>host_summary, x</code> <code>\$host_summary</code>	Statement activity, file I/O, and connections, grouped by host	
<code>host_summary_by_file_io, x</code> <code>\$host_summary_by_file_io</code>	File I/O, grouped by host	
<code>host_summary_by_file_io_type, x</code> <code>\$host_summary_by_file_io_type</code>	File I/O, grouped by host and event type	
<code>host_summary_by_stages, x</code> <code>\$host_summary_by_stages</code>	Statement stages, grouped by host	
<code>host_summary_by_statement, x</code> <code>\$host_summary_by_statement_latency</code>	Statement statistics, grouped by host	
<code>host_summary_by_statement, x</code> <code>\$host_summary_by_statement_type</code>	Statements executed, grouped by host and statement	
<code>innodb_buffer_stats_by_schema, x</code> <code>\$innodb_buffer_stats_by_schema</code>	InnoDB buffer information, grouped by schema	
<code>innodb_buffer_stats_by_table, x</code> <code>\$innodb_buffer_stats_by_table</code>	InnoDB buffer information, grouped by schema and table	
<code>innodb_lock_waits, x</code> <code>\$innodb_lock_waits</code>	InnoDB lock information	
<code>io_by_thread_latency, x</code> <code>\$io_by_thread_latency</code>	I/O consumers, grouped by thread	
<code>io_global_by_file_by_bytes, x</code> <code>\$io_global_by_file_by_bytes</code>	Global I/O consumers, grouped by file and bytes	
<code>io_global_by_file_latency, x</code> <code>\$io_global_by_file_latency</code>	Global I/O consumers, grouped by file and latency	

View Name	Description	Deprecated
<code>io_global_by_wait_by_bytes</code> x <code>\$io_global_by_wait_by_bytes</code>	Global I/O consumers, grouped by bytes	
<code>io_global_by_wait_by_latency</code> x <code>\$io_global_by_wait_by_latency</code>	Global I/O consumers, grouped by latency	
<code>latest_file_io</code> , x <code>\$latest_file_io</code>	Most recent I/O, grouped by file and thread	
<code>memory_by_host_by_current</code> x <code>\$memory_by_host_by_current_bytes</code>	Memory use, grouped by host	
<code>memory_by_thread_by_current</code> x <code>\$memory_by_thread_by_current_bytes</code>	Memory use, grouped by thread	
<code>memory_by_user_by_current</code> x <code>\$memory_by_user_by_current_bytes</code>	Memory use, grouped by user	
<code>memory_global_by_current</code> x <code>\$memory_global_by_current_bytes</code>	Memory use, grouped by allocation type	
<code>memory_global_total</code> , x <code>\$memory_global_total</code>	Total memory use	
<code>metrics</code>	Server metrics	
<code>processlist</code> , x <code>\$processlist</code>	Processlist information	
<code>ps_check_lost_instrumentation</code>	Variables that have lost instruments	
<code>schema_auto_increment_columns</code>	AUTO_INCREMENT column information	
<code>schema_index_statistics</code> , x <code>\$schema_index_statistics</code>	Index statistics	
<code>schema_object_overview</code>	Types of objects within each schema	
<code>schema_redundant_indexes</code>	Duplicate or redundant indexes	
<code>schema_table_lock_waits</code> , x <code>\$schema_table_lock_waits</code>	Sessions waiting for metadata locks	
<code>schema_table_statistics</code> , x <code>\$schema_table_statistics</code>	Table statistics	
<code>schema_table_statistics_with_buffer</code> x <code>\$schema_table_statistics_with_buffer</code>	Table statistics, including InnoDB buffer pool statistics	
<code>schema_tables_with_full_table_scans</code> x <code>\$schema_tables_with_full_table_scans</code>	Tables being accessed with full scans	
<code>schema_unused_indexes</code>	Indexes not in active use	

View Name	Description	Deprecated
session, x\$session	Processlist information for user sessions	
session_ssl_status	Connection SSL information	
statement_analysis, x\$statement_analysis	Statement aggregate statistics	
statements_with_errors_or_x\$statements_with_errors_or_warnings	Statements that have produced errors or warnings	
statements_with_full_table_scans	Statements that have done full table scans	
statements_with_runtimes_in_95th_percentile	Statements with highest average runtime	
statements_with_sorting	Statements that performed sorts	
statements_with_temp_tables	Statements that used temporary tables	
user_summary, x\$user_summary	User statement and connection activity	
user_summary_by_file_io	File I/O, grouped by user	
user_summary_by_file_io_type	File I/O, grouped by user and event	
user_summary_by_stages	Stage events, grouped by user	
user_summary_by_statement_latency	Statement statistics, grouped by user	
user_summary_by_statement_type	Statements executed, grouped by user and statement	
version	Current sys schema and MySQL server versions	Yes
wait_classes_global_by_avg_latency	Wait class average latency, grouped by event class	
wait_classes_global_by_latency	Wait class total latency, grouped by event class	
waits_by_host_by_latency	Wait events, grouped by host and event	

View Name	Description	Deprecated
<code>waits_by_user_by_latency</code> , x <code>\$waits_by_user_by_latency</code>	Wait events, grouped by user and event	
<code>waits_global_by_latency</code> , x <code>\$waits_global_by_latency</code>	Wait events, grouped by event	
x <code>\$ps_digest_95th_percentile</code>	Helper view for 95th-percentile <code>views_avg_us</code>	
x <code>\$ps_digest_avg_latency_distro</code>	Helper view for 95th-percentile <code>views_distro</code>	
x <code>\$ps_schema_table_statistics</code>	Helper view for table-statistics <code>views</code>	
x\$schema_flattened_keys	Helper view for schema_redundant_indexes	

**Table 30.3 sys Schema Stored Procedures**

Procedure Name	Description
<code>create_synonym_db()</code>	Create synonym for schema
<code>diagnostics()</code>	Collect system diagnostic information
<code>execute_prepared_stmt()</code>	Execute prepared statement
<code>ps_setup_disable_background_threads()</code>	Disable background thread instrumentation
<code>ps_setup_disable_consumer()</code>	Disable consumers
<code>ps_setup_disable_instrument()</code>	Disable instruments
<code>ps_setup_disable_thread()</code>	Disable instrumentation for thread
<code>ps_setup_enable_background_threads()</code>	Enable background thread instrumentation
<code>ps_setup_enable_consumer()</code>	Enable consumers
<code>ps_setup_enable_instrument()</code>	Enable instruments
<code>ps_setup_enable_thread()</code>	Enable instrumentation for thread
<code>ps_setup_reload_saved()</code>	Reload saved Performance Schema configuration
<code>ps_setup_reset_to_default()</code>	Reset saved Performance Schema configuration
<code>ps_setup_save()</code>	Save Performance Schema configuration
<code>ps_setup_show_disabled()</code>	Display disabled Performance Schema configuration
<code>ps_setup_show_disabled_consumers()</code>	Display disabled Performance Schema consumers
<code>ps_setup_show_disabled_instruments()</code>	Display disabled Performance Schema instruments
<code>ps_setup_show_enabled()</code>	Display enabled Performance Schema configuration
<code>ps_setup_show_enabled_consumers()</code>	Display enabled Performance Schema consumers
<code>ps_setup_show_enabled_instruments()</code>	Display enabled Performance Schema instruments
<code>ps_statement_avg_latency_histogram()</code>	Display statement latency histogram
<code>ps_trace_statement_digest()</code>	Trace Performance Schema instrumentation for digest
<code>ps_trace_thread()</code>	Dump Performance Schema data for thread

Procedure Name	Description
<code>ps_truncate_all_tables()</code>	Truncate Performance Schema summary tables
<code>statement_performance_analyzer()</code>	Report of statements running on server
<code>table_exists()</code>	Whether a table exists

**Table 30.4 sys Schema Stored Functions**

Function Name	Description	Deprecated
<code>extract_schema_from_file_name()</code>	Extract schema name part of file name	
<code>extract_table_from_file_name()</code>	Extract table name part of file name	
<code>format_bytes()</code>	Convert byte count to value with units	Yes
<code>format_path()</code>	Replace directories in path name with symbolic system variable names	
<code>format_statement()</code>	Truncate long statement to fixed length	
<code>format_time()</code>	Convert picoseconds time to value with units	Yes
<code>list_add()</code>	Add item to list	
<code>list_drop()</code>	Remove item from list	
<code>ps_is_account_enabled()</code>	Whether Performance Schema instrumentation for account is enabled	
<code>ps_is_consumer_enabled()</code>	Whether Performance Schema consumer is enabled	
<code>ps_is_instrument_default_enabled()</code>	Whether Performance Schema instrument is enabled by default	
<code>ps_is_instrument_default_timed()</code>	Whether Performance Schema instrument is timed by default	
<code>ps_is_thread_instrumented()</code>	Whether Performance Schema instrumentation for connection ID is enabled	
<code>ps_thread_account()</code>	Account associated with Performance Schema thread ID	
<code>ps_thread_id()</code>	Performance Schema thread ID associated with connection ID	Yes
<code>ps_thread_stack()</code>	Event information for connection ID	
<code>ps_thread trx info()</code>	Transaction information for thread ID	
<code>quote_identifier()</code>	Quote string as identifier	
<code>sys_get_config()</code>	sys schema configuration option value	
<code>version_major()</code>	MySQL server major version number	

Function Name	Description	Deprecated
<code>version_minor()</code>	MySQL server minor version number	
<code>version_patch()</code>	MySQL server patch release version number	

## 30.4.2 sys Schema Tables and Triggers

The following sections describe `sys` schema tables and triggers.

### 30.4.2.1 The `sys_config` Table

This table contains `sys` schema configuration options, one row per option. Configuration changes made by updating this table persist across client sessions and server restarts.

The `sys_config` table has these columns:

- `variable`

The configuration option name.

- `value`

The configuration option value.

- `set_time`

The timestamp of the most recent modification to the row.

- `set_by`

The account that made the most recent modification to the row. The value is `NULL` if the row has not been changed since the `sys` schema was installed.

As an efficiency measure to minimize the number of direct reads from the `sys_config` table, `sys` schema functions that use a value from this table check for a user-defined variable with a corresponding name, which is the user-defined variable having the same name plus a `@sys.` prefix. (For example, the variable corresponding to the `diagnostics.include_raw` option is `@sys.diagnostics.include_raw`.) If the user-defined variable exists in the current session and is non-`NULL`, the function uses its value in preference to the value in the `sys_config` table. Otherwise, the function reads and uses the value from the table. In the latter case, the calling function conventionally also sets the corresponding user-defined variable to the table value so that further references to the configuration option within the same session use the variable and need not read the table again.

For example, the `statement_truncate_len` option controls the maximum length of statements returned by the `format_statement()` function. The default is 64. To temporarily change the value to 32 for your current session, set the corresponding `@sys.statement_truncate_len` user-defined variable:

```
mysql> SET @stmt = 'SELECT variable, value, set_time, set_by FROM sys_config';
mysql> SELECT sys.format_statement(@stmt);
+-----+
| sys.format_statement(@stmt) |
+-----+
| SELECT variable, value, set_time, set_by FROM sys_config |
+-----+
mysql> SET @sys.statement_truncate_len = 32;
mysql> SELECT sys.format_statement(@stmt);
+-----+
| sys.format_statement(@stmt) |
+-----+
```

```
| SELECT variabl ... ROM sys_config |
+-----+
```

Subsequent invocations of `format_statement()` within the session continue to use the user-defined variable value (32), rather than the value stored in the table (64).

To stop using the user-defined variable and revert to using the value in the table, set the variable to `NULL` within your session:

```
mysql> SET @sys.format_statement_len = NULL;
mysql> SELECT sys.format_statement(@stmt);
+-----+
| sys.format_statement(@stmt) |
+-----+
| SELECT variable, value, set_time, set_by FROM sys_config |
+-----+
```

Alternatively, end your current session (causing the user-defined variable to no longer exist) and begin a new session.

The conventional relationship just described between options in the `sys_config` table and user-defined variables can be exploited to make temporary configuration changes that end when your session ends. However, if you set a user-defined variable and then subsequently change the corresponding table value within the same session, the changed table value is not used in that session as long as the user-defined variable exists with a non-`NULL` value. (The changed table value *is* used in other sessions in which the user-defined variable is not assigned.)

The following list describes the options in the `sys_config` table and the corresponding user-defined variables:

- `diagnostics.allow_i_s_tables`, `@sys.diagnostics.allow_i_s_tables`

If this option is `ON`, the `diagnostics()` procedure is permitted to perform table scans on the Information Schema `TABLES` table. This can be expensive if there are many tables. The default is `OFF`.

- `diagnostics.include_raw`, `@sys.diagnostics.include_raw`

If this option is `ON`, the `diagnostics()` procedure includes the raw output from querying the `metrics` view. The default is `OFF`.

- `ps_thread_trx_info.max_length`, `@sys.ps_thread_trx_info.max_length`

The maximum length for JSON output produced by the `ps_thread_trx_info()` function. The default is 65535.

- `statement_performance_analyzer.limit`,  
`@sys.statement_performance_analyzer.limit`

The maximum number of rows to return for views that have no built-in limit. (For example, the `statements_with_runtimes_in_95th_percentile` view has a built-in limit in the sense that it returns only statements with average execution time in the 95th percentile.) The default is 100.

- `statement_performance_analyzer.view`,  
`@sys.statement_performance_analyzer.view`

The custom query or view to be used by the `statement_performance_analyzer()` procedure (which is itself invoked by the `diagnostics()` procedure). If the option value contains a space, it is interpreted as a query. Otherwise, it must be the name of an existing view that queries the Performance Schema `events_statements_summary_by_digest` table. There cannot be any `LIMIT` clause in the query or view definition if the `statement_performance_analyzer.limit` configuration option is greater than 0. The default is `NULL` (no custom view defined).

- `statement_truncate_len`, `@sys.statement_truncate_len`

The maximum length of statements returned by the `format_statement()` function. Longer statements are truncated to this length. The default is 64.

Other options can be added to the `sys_config` table. For example, the `diagnostics()` and `execute_prepared_stmt()` procedures use the `debug` option if it exists, but this option is not part of the `sys_config` table by default because debug output normally is enabled only temporarily, by setting the corresponding `@sys.debug` user-defined variable. To enable debug output without having to set that variable in individual sessions, add the option to the table:

```
mysql> INSERT INTO sys.sys_config (variable, value) VALUES('debug', 'ON');
```

To change the debug setting in the table, do two things. First, modify the value in the table itself:

```
mysql> UPDATE sys.sys_config
 SET value = 'OFF'
 WHERE variable = 'debug';
```

Second, to also ensure that procedure invocations within the current session use the changed value from the table, set the corresponding user-defined variable to `NULL`:

```
mysql> SET @sys.debug = NULL;
```

### 30.4.2.2 The `sys_config_insert_set_user` Trigger

For rows added to the `sys_config` table by `INSERT` statements, the `sys_config_insert_set_user` trigger sets the `set_by` column to the current user.

### 30.4.2.3 The `sys_config_update_set_user` Trigger

The `sys_config_update_set_user` trigger for the `sys_config` table is similar to the `sys_config_insert_set_user` trigger, but for `UPDATE` statements.

## 30.4.3 sys Schema Views

The following sections describe `sys` schema views.

The `sys` schema contains many views that summarize Performance Schema tables in various ways. Most of these views come in pairs, such that one member of the pair has the same name as the other member, plus a `x$` prefix. For example, the `host_summary_by_file_io` view summarizes file I/O grouped by host and displays latencies converted from picoseconds to more readable values (with units);

```
mysql> SELECT * FROM sys.host_summary_by_file_io;
+-----+-----+-----+
| host | ios | io_latency |
+-----+-----+-----+
| localhost | 67570 | 5.38 s |
| background | 3468 | 4.18 s |
+-----+-----+-----+
```

The `x$host_summary_by_file_io` view summarizes the same data but displays unformatted picosecond latencies:

```
mysql> SELECT * FROM sys.x$host_summary_by_file_io;
+-----+-----+-----+
| host | ios | io_latency |
+-----+-----+-----+
| localhost | 67574 | 5380678125144 |
| background | 3474 | 4758696829416 |
+-----+-----+-----+
```

The view without the `x$` prefix is intended to provide output that is more user friendly and easier to read. The view with the `x$` prefix that displays the same values in raw form is intended more for use with other tools that perform their own processing on the data.

Views without the `x$` prefix differ from the corresponding `x$` views in these ways:

- Byte counts are formatted with size units using `format_bytes()`.
- Time values are formatted with temporal units using `format_time()`.
- SQL statements are truncated to a maximum display width using `format_statement()`.
- Path name are shortened using `format_path()`.

### 30.4.3.1 The `host_summary` and `x$host_summary` Views

These views summarize statement activity, file I/O, and connections, grouped by host.

The `host_summary` and `x$host_summary` views have these columns:

- `host`

The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `statements`

The total number of statements for the host.

- `statement_latency`

The total wait time of timed statements for the host.

- `statement_avg_latency`

The average wait time per timed statement for the host.

- `table_scans`

The total number of table scans for the host.

- `file_ios`

The total number of file I/O events for the host.

- `file_io_latency`

The total wait time of timed file I/O events for the host.

- `current_connections`

The current number of connections for the host.

- `total_connections`

The total number of connections for the host.

- `unique_users`

The number of distinct users for the host.

- `current_memory`

The current amount of allocated memory for the host.

- `total_memory_allocated`

The total amount of allocated memory for the host.

#### 30.4.3.2 The `host_summary_by_file_io` and `x$host_summary_by_file_io` Views

These views summarize file I/O, grouped by host. By default, rows are sorted by descending total file I/O latency.

The `host_summary_by_file_io` and `x$host_summary_by_file_io` views have these columns:

- `host`

The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `ios`

The total number of file I/O events for the host.

- `io_latency`

The total wait time of timed file I/O events for the host.

#### 30.4.3.3 The `host_summary_by_file_io_type` and `x$host_summary_by_file_io_type` Views

These views summarize file I/O, grouped by host and event type. By default, rows are sorted by host and descending total I/O latency.

The `host_summary_by_file_io_type` and `x$host_summary_by_file_io_type` views have these columns:

- `host`

The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `event_name`

The file I/O event name.

- `total`

The total number of occurrences of the file I/O event for the host.

- `total_latency`

The total wait time of timed occurrences of the file I/O event for the host.

- `max_latency`

The maximum single wait time of timed occurrences of the file I/O event for the host.

#### 30.4.3.4 The `host_summary_by_stages` and `x$host_summary_by_stages` Views

These views summarize statement stages, grouped by host. By default, rows are sorted by host and descending total latency.

The `host_summary_by_stages` and `x$host_summary_by_stages` views have these columns:

- `host`

The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `event_name`

The stage event name.

- `total`

The total number of occurrences of the stage event for the host.

- `total_latency`

The total wait time of timed occurrences of the stage event for the host.

- `avg_latency`

The average wait time per timed occurrence of the stage event for the host.

### **30.4.3.5 The `host_summary_by_statement_latency` and `x$host_summary_by_statement_latency` Views**

These views summarize overall statement statistics, grouped by host. By default, rows are sorted by descending total latency.

The `host_summary_by_statement_latency` and `x$host_summary_by_statement_latency` views have these columns:

- `host`

The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `total`

The total number of statements for the host.

- `total_latency`

The total wait time of timed statements for the host.

- `max_latency`

The maximum single wait time of timed statements for the host.

- `lock_latency`

The total time waiting for locks by timed statements for the host.

- `cpu_latency`

The time spent on CPU for the current thread.

- `rows_sent`

The total number of rows returned by statements for the host.

- `rows_examined`

The total number of rows read from storage engines by statements for the host.

- `rows_affected`

The total number of rows affected by statements for the host.

- `full_scans`

The total number of full table scans by statements for the host.

### 30.4.3.6 The `host_summary_by_statement_type` and `x$host_summary_by_statement_type` Views

These views summarize information about statements executed, grouped by host and statement type. By default, rows are sorted by host and descending total latency.

The `host_summary_by_statement_type` and `x$host_summary_by_statement_type` views have these columns:

- `host`

The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `statement`

The final component of the statement event name.

- `total`

The total number of occurrences of the statement event for the host.

- `total_latency`

The total wait time of timed occurrences of the statement event for the host.

- `max_latency`

The maximum single wait time of timed occurrences of the statement event for the host.

- `lock_latency`

The total time waiting for locks by timed occurrences of the statement event for the host.

- `cpu_latency`

The time spent on CPU for the current thread.

- `rows_sent`

The total number of rows returned by occurrences of the statement event for the host.

- `rows_examined`

The total number of rows read from storage engines by occurrences of the statement event for the host.

- `rows_affected`

The total number of rows affected by occurrences of the statement event for the host.

- `full_scans`

The total number of full table scans by occurrences of the statement event for the host.

### 30.4.3.7 The innodb\_buffer\_stats\_by\_schema and x\$innodb\_buffer\_stats\_by\_schema Views

These views summarize the information in the `INFORMATION_SCHEMA INNODB_BUFFER_PAGE` table, grouped by schema. By default, rows are sorted by descending buffer size.

#### Warning

Querying views that access the `INNODB_BUFFER_PAGE` table can affect performance. Do not query these views on a production system unless you are aware of the performance impact and have determined it to be acceptable. To avoid impacting performance on a production system, reproduce the issue you want to investigate and query buffer pool statistics on a test instance.

The `innodb_buffer_stats_by_schema` and `x$innodb_buffer_stats_by_schema` views have these columns:

- `object_schema`

The schema name for the object, or `InnoDB System` if the table belongs to the `InnoDB` storage engine.

- `allocated`

The total number of bytes allocated for the schema.

- `data`

The total number of data bytes allocated for the schema.

- `pages`

The total number of pages allocated for the schema.

- `pages_hashed`

The total number of hashed pages allocated for the schema.

- `pages_old`

The total number of old pages allocated for the schema.

- `rows_cached`

The total number of cached rows for the schema.

### 30.4.3.8 The innodb\_buffer\_stats\_by\_table and x\$innodb\_buffer\_stats\_by\_table Views

These views summarize the information in the `INFORMATION_SCHEMA INNODB_BUFFER_PAGE` table, grouped by schema and table. By default, rows are sorted by descending buffer size.

#### Warning

Querying views that access the `INNODB_BUFFER_PAGE` table can affect performance. Do not query these views on a production system unless you are aware of the performance impact and have determined it to be acceptable. To avoid impacting performance on a production system, reproduce the issue you want to investigate and query buffer pool statistics on a test instance.

The `innodb_buffer_stats_by_table` and `x$innodb_buffer_stats_by_table` views have these columns:

- `object_schema`

The schema name for the object, or `InnoDB System` if the table belongs to the `InnoDB` storage engine.

- `object_name`

The table name.

- `allocated`

The total number of bytes allocated for the table.

- `data`

The number of data bytes allocated for the table.

- `pages`

The total number of pages allocated for the table.

- `pages_hashed`

The number of hashed pages allocated for the table.

- `pages_old`

The number of old pages allocated for the table.

- `rows_cached`

The number of cached rows for the table.

#### 30.4.3.9 The `innodb_lock_waits` and `x$innodb_lock_waits` Views

These views summarize the `InnoDB` locks that transactions are waiting for. By default, rows are sorted by descending lock age.

The `innodb_lock_waits` and `x$innodb_lock_waits` views have these columns:

- `wait_started`

The time at which the lock wait started.

- `wait_age`

How long the lock has been waited for, as a `TIME` value.

- `wait_age_secs`

How long the lock has been waited for, in seconds.

- `locked_table_schema`

The schema that contains the locked table.

- `locked_table_name`

The name of the locked table.

- `locked_table_partition`

The name of the locked partition, if any; `NULL` otherwise.

- `locked_table_subpartition`

The name of the locked subpartition, if any; `NULL` otherwise.

- `locked_index`

The name of the locked index.

- `locked_type`

The type of the waiting lock.

- `waiting_trx_id`

The ID of the waiting transaction.

- `waiting trx_started`

The time at which the waiting transaction started.

- `waiting_trx_age`

How long the waiting transaction has been waiting, as a `TIME` value.

- `waiting_trx_rows_locked`

The number of rows locked by the waiting transaction.

- `waiting_trx_rows_modified`

The number of rows modified by the waiting transaction.

- `waiting_pid`

The processlist ID of the waiting transaction.

- `waiting_query`

The statement that is waiting for the lock.

- `waiting_lock_id`

The ID of the waiting lock.

- `waiting_lock_mode`

The mode of the waiting lock.

- `blocking_trx_id`

The ID of the transaction that is blocking the waiting lock.

- `blocking_pid`

The processlist ID of the blocking transaction.

- `blocking_query`

The statement the blocking transaction is executing. This field reports `NULL` if the session that issued the blocking query becomes idle. For more information, see [Identifying a Blocking Query After the Issuing Session Becomes Idle](#).

- `blocking_lock_id`

The ID of the lock that is blocking the waiting lock.

- `blocking_lock_mode`

The mode of the lock that is blocking the waiting lock.

- `blocking_trx_started`

The time at which the blocking transaction started.

- `blocking_trx_age`

How long the blocking transaction has been executing, as a `TIME` value.

- `blocking_trx_rows_locked`

The number of rows locked by the blocking transaction.

- `blocking_trx_rows_modified`

The number of rows modified by the blocking transaction.

- `sql_kill_blocking_query`

The `KILL` statement to execute to kill the blocking statement.

- `sql_kill_blocking_connection`

The `KILL` statement to execute to kill the session running the blocking statement.

#### 30.4.3.10 The `io_by_thread_by_latency` and `x$io_by_thread_by_latency` Views

These views summarize I/O consumers to display time waiting for I/O, grouped by thread. By default, rows are sorted by descending total I/O latency.

The `io_by_thread_by_latency` and `x$io_by_thread_by_latency` views have these columns:

- `user`

For foreground threads, the account associated with the thread. For background threads, the thread name.

- `total`

The total number of I/O events for the thread.

- `total_latency`

The total wait time of timed I/O events for the thread.

- `min_latency`

The minimum single wait time of timed I/O events for the thread.

- `avg_latency`

The average wait time per timed I/O event for the thread.

- `max_latency`

The maximum single wait time of timed I/O events for the thread.

- `thread_id`

The thread ID.

- `processlist_id`

For foreground threads, the processlist ID of the thread. For background threads, `NULL`.

### 30.4.3.11 The `io_global_by_file_by_bytes` and `x$io_global_by_file_by_bytes` Views

These views summarize global I/O consumers to display amount of I/O, grouped by file. By default, rows are sorted by descending total I/O (bytes read and written).

The `io_global_by_file_by_bytes` and `x$io_global_by_file_by_bytes` views have these columns:

- `file`

The file path name.

- `count_read`

The total number of read events for the file.

- `total_read`

The total number of bytes read from the file.

- `avg_read`

The average number of bytes per read from the file.

- `count_write`

The total number of write events for the file.

- `total_written`

The total number of bytes written to the file.

- `avg_write`

The average number of bytes per write to the file.

- `total`

The total number of bytes read and written for the file.

- `write_pct`

The percentage of total bytes of I/O that were writes.

### 30.4.3.12 The `io_global_by_file_by_latency` and `x$io_global_by_file_by_latency` Views

These views summarize global I/O consumers to display time waiting for I/O, grouped by file. By default, rows are sorted by descending total latency.

The `io_global_by_file_by_latency` and `x$io_global_by_file_by_latency` views have these columns:

- `file`

The file path name.

- `total`

The total number of I/O events for the file.

- `total_latency`  
The total wait time of timed I/O events for the file.
- `count_read`  
The total number of read I/O events for the file.
- `read_latency`  
The total wait time of timed read I/O events for the file.
- `count_write`  
The total number of write I/O events for the file.
- `write_latency`  
The total wait time of timed write I/O events for the file.
- `count_misc`  
The total number of other I/O events for the file.
- `misc_latency`  
The total wait time of timed other I/O events for the file.

#### 30.4.3.13 The `io_global_by_wait_by_bytes` and `x$io_global_by_wait_by_bytes` Views

These views summarize global I/O consumers to display amount of I/O and time waiting for I/O, grouped by event. By default, rows are sorted by descending total I/O (bytes read and written).

The `io_global_by_wait_by_bytes` and `x$io_global_by_wait_by_bytes` views have these columns:

- `event_name`  
The I/O event name, with the `wait/io/file/` prefix stripped.
- `total`  
The total number of occurrences of the I/O event.
- `total_latency`  
The total wait time of timed occurrences of the I/O event.
- `min_latency`  
The minimum single wait time of timed occurrences of the I/O event.
- `avg_latency`  
The average wait time per timed occurrence of the I/O event.
- `max_latency`  
The maximum single wait time of timed occurrences of the I/O event.
- `count_read`  
The number of read requests for the I/O event.

- `total_read`

The number of bytes read for the I/O event.

- `avg_read`

The average number of bytes per read for the I/O event.

- `count_write`

The number of write requests for the I/O event.

- `total_written`

The number of bytes written for the I/O event.

- `avg_written`

The average number of bytes per write for the I/O event.

- `total_requested`

The total number of bytes read and written for the I/O event.

#### **30.4.3.14 The `io_global_by_wait_by_latency` and `x$io_global_by_wait_by_latency` Views**

These views summarize global I/O consumers to display amount of I/O and time waiting for I/O, grouped by event. By default, rows are sorted by descending total latency.

The `io_global_by_wait_by_latency` and `x$io_global_by_wait_by_latency` views have these columns:

- `event_name`

The I/O event name, with the `wait/io/file/` prefix stripped.

- `total`

The total number of occurrences of the I/O event.

- `total_latency`

The total wait time of timed occurrences of the I/O event.

- `avg_latency`

The average wait time per timed occurrence of the I/O event.

- `max_latency`

The maximum single wait time of timed occurrences of the I/O event.

- `read_latency`

The total wait time of timed read occurrences of the I/O event.

- `write_latency`

The total wait time of timed write occurrences of the I/O event.

- `misc_latency`

The total wait time of timed other occurrences of the I/O event.

- `count_read`

The number of read requests for the I/O event.

- `total_read`

The number of bytes read for the I/O event.

- `avg_read`

The average number of bytes per read for the I/O event.

- `count_write`

The number of write requests for the I/O event.

- `total_written`

The number of bytes written for the I/O event.

- `avg_written`

The average number of bytes per write for the I/O event.

### 30.4.3.15 The `latest_file_io` and `x$latest_file_io` Views

These views summarize file I/O activity, grouped by file and thread. By default, rows are sorted with most recent I/O first.

The `latest_file_io` and `x$latest_file_io` views have these columns:

- `thread`

For foreground threads, the account associated with the thread (and port number for TCP/IP connections). For background threads, the thread name and thread ID

- `file`

The file path name.

- `latency`

The wait time of the file I/O event.

- `operation`

The type of operation.

- `requested`

The number of data bytes requested for the file I/O event.

### 30.4.3.16 The `memory_by_host_by_current_bytes` and `x$memory_by_host_by_current_bytes` Views

These views summarize memory use, grouped by host. By default, rows are sorted by descending amount of memory used.

The `memory_by_host_by_current_bytes` and `x$memory_by_host_by_current_bytes` views have these columns:

- `host`

The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `current_count_used`

The current number of allocated memory blocks that have not been freed yet for the host.

- `current_allocated`

The current number of allocated bytes that have not been freed yet for the host.

- `current_avg_alloc`

The current number of allocated bytes per memory block for the host.

- `current_max_alloc`

The largest single current memory allocation in bytes for the host.

- `total_allocated`

The total memory allocation in bytes for the host.

#### **30.4.3.17 The `memory_by_thread_by_current_bytes` and `x$memory_by_thread_by_current_bytes` Views**

These views summarize memory use, grouped by thread. By default, rows are sorted by descending amount of memory used.

The `memory_by_thread_by_current_bytes` and `x$memory_by_thread_by_current_bytes` views have these columns:

- `thread_id`

The thread ID.

- `user`

The thread user or thread name.

- `current_count_used`

The current number of allocated memory blocks that have not been freed yet for the thread.

- `current_allocated`

The current number of allocated bytes that have not been freed yet for the thread.

- `current_avg_alloc`

The current number of allocated bytes per memory block for the thread.

- `current_max_alloc`

The largest single current memory allocation in bytes for the thread.

- `total_allocated`

The total memory allocation in bytes for the thread.

#### **30.4.3.18 The `memory_by_user_by_current_bytes` and `x$memory_by_user_by_current_bytes` Views**

These views summarize memory use, grouped by user. By default, rows are sorted by descending amount of memory used.

The `memory_by_user_by_current_bytes` and `x$memory_by_user_by_current_bytes` views have these columns:

- `user`

The client user name. Rows for which the `USER` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `current_count_used`

The current number of allocated memory blocks that have not been freed yet for the user.

- `current_allocated`

The current number of allocated bytes that have not been freed yet for the user.

- `current_avg_alloc`

The current number of allocated bytes per memory block for the user.

- `current_max_alloc`

The largest single current memory allocation in bytes for the user.

- `total_allocated`

The total memory allocation in bytes for the user.

### 30.4.3.19 The `memory_global_by_current_bytes` and `x$memory_global_by_current_bytes` Views

These views summarize memory use, grouped by allocation type (that is, by event). By default, rows are sorted by descending amount of memory used.

The `memory_global_by_current_bytes` and `x$memory_global_by_current_bytes` views have these columns:

- `event_name`

The memory event name.

- `current_count`

The total number of occurrences of the event.

- `current_alloc`

The current number of allocated bytes that have not been freed yet for the event.

- `current_avg_alloc`

The current number of allocated bytes per memory block for the event.

- `high_count`

The high-water mark for number of memory blocks allocated for the event.

- `high_alloc`

The high-water mark for number of bytes allocated for the event.

- `high_avg_alloc`

The high-water mark for average number of bytes per memory block allocated for the event.

### 30.4.3.20 The `memory_global_total` and `x$memory_global_total` Views

These views summarize total memory use within the server.

The `memory_global_total` and `x$memory_global_total` views have these columns:

- `total_allocated`

The total bytes of memory allocated within the server.

### 30.4.3.21 The `metrics` View

This view summarizes MySQL server metrics to show variable names, values, types, and whether they are enabled. By default, rows are sorted by variable type and name.

The `metrics` view includes this information:

- Global status variables from the Performance Schema `global_status` table
- InnoDB metrics from the `INFORMATION_SCHEMA INNODB_METRICS` table
- Current and total memory allocation, based on the Performance Schema memory instrumentation
- The current time (human readable and Unix timestamp formats)

There is some duplication of information between the `global_status` and `INNODB_METRICS` tables, which the `metrics` view eliminates.

The `metrics` view has these columns:

- `Variable_name`

The metric name. The metric type determines the source from which the name is taken:

- For global status variables: The `VARIABLE_NAME` column of the `global_status` table
- For InnoDB metrics: The `NAME` column of the `INNODB_METRICS` table
- For other metrics: A view-provided descriptive string

- `Variable_value`

The metric value. The metric type determines the source from which the value is taken:

- For global status variables: The `VARIABLE_VALUE` column of the `global_status` table
- For InnoDB metrics: The `COUNT` column of the `INNODB_METRICS` table
- For memory metrics: The relevant column from the Performance Schema `memory_summary_global_by_event_name` table
- For the current time: The value of `NOW(3)` or `UNIX_TIMESTAMP(NOW(3))`

- `Type`

The metric type:

- For global status variables: [Global Status](#)
- For [InnoDB](#) metrics: [InnoDB Metrics](#) - %, where % is replaced by the value of the [SUBSYSTEM](#) column of the [INNODB\\_METRICS](#) table
- For memory metrics: [Performance Schema](#)
- For the current time: [System Time](#)
- [Enabled](#)

Whether the metric is enabled:

- For global status variables: [YES](#)
- For [InnoDB](#) metrics: [YES](#) if the [STATUS](#) column of the [INNODB\\_METRICS](#) table is [enabled](#), [NO](#) otherwise
- For memory metrics: [NO](#), [YES](#), or [PARTIAL](#) (currently, [PARTIAL](#) occurs only for memory metrics and indicates that not all [memory/%](#) instruments are enabled; Performance Schema memory instruments are always enabled)
- For the current time: [YES](#)

### 30.4.3.22 The processlist and x\$processlist Views

The MySQL process list indicates the operations currently being performed by the set of threads executing within the server. The [processlist](#) and [x\\$processlist](#) views summarize process information. They provide more complete information than the [SHOW PROCESSLIST](#) statement and the [INFORMATION\\_SCHEMA PROCESSLIST](#) table, and are also nonblocking. By default, rows are sorted by descending process time and descending wait time. For a comparison of process information sources, see [Sources of Process Information](#).

The column descriptions here are brief. For additional information, see the description of the Performance Schema [threads](#) table at [Section 29.12.22.8, “The threads Table”](#).

The [processlist](#) and [x\\$processlist](#) views have these columns:

- [thd\\_id](#)

The thread ID.

- [conn\\_id](#)

The connection ID.

- [user](#)

The thread user or thread name.

- [db](#)

The default database for the thread, or [NULL](#) if there is none.

- [command](#)

For foreground threads, the type of command the thread is executing on behalf of the client, or [Sleep](#) if the session is idle.

- [state](#)

An action, event, or state that indicates what the thread is doing.

- `time`

The time in seconds that the thread has been in its current state.

- `current_statement`

The statement the thread is executing, or `NULL` if it is not executing any statement.

- `execution_engine`

The query execution engine. The value is either `PRIMARY` or `SECONDARY`. For use with MySQL HeatWave Service and MySQL HeatWave, where the `PRIMARY` engine is `InnoDB` and `SECONDARY` engine is MySQL HeatWave (`RAPID`). For MySQL Community Edition Server, MySQL Enterprise Edition Server (on-premise), and MySQL HeatWave Service without MySQL HeatWave, the value is always `PRIMARY`.

- `statement_latency`

How long the statement has been executing.

- `progress`

The percentage of work completed for stages that support progress reporting. See [Section 30.3, “sys Schema Progress Reporting”](#).

- `lock_latency`

The time spent waiting for locks by the current statement.

- `cpu_latency`

The time spent on CPU for the current thread.

- `rows_examined`

The number of rows read from storage engines by the current statement.

- `rows_sent`

The number of rows returned by the current statement.

- `rows_affected`

The number of rows affected by the current statement.

- `tmp_tables`

The number of internal in-memory temporary tables created by the current statement.

- `tmp_disk_tables`

The number of internal on-disk temporary tables created by the current statement.

- `full_scan`

The number of full table scans performed by the current statement.

- `last_statement`

The last statement executed by the thread, if there is no currently executing statement or wait.

- `last_statement_latency`

How long the last statement executed.

- `current_memory`  
The number of bytes allocated by the thread.
- `last_wait`  
The name of the most recent wait event for the thread.
- `last_wait_latency`  
The wait time of the most recent wait event for the thread.
- `source`  
The source file and line number containing the instrumented code that produced the event.
- `trx_latency`  
The wait time of the current transaction for the thread.
- `trx_state`  
The state for the current transaction for the thread.
- `trx_autocommit`  
Whether autocommit mode was enabled when the current transaction started.
- `pid`  
The client process ID.
- `program_name`  
The client program name.

#### 30.4.3.23 The `ps_check_lost_instrumentation` View

This view returns information about lost Performance Schema instruments, to indicate whether the Performance Schema is unable to monitor all runtime data.

The `ps_check_lost_instrumentation` view has these columns:

- `variable_name`  
The Performance Schema status variable name indicating which type of instrument was lost.
- `variable_value`  
The number of instruments lost.

#### 30.4.3.24 The `schema_auto_increment_columns` View

This view indicates which tables have `AUTO_INCREMENT` columns and provides information about those columns, such as the current and maximum column values and the usage ratio (ratio of used to possible values). By default, rows are sorted by descending usage ratio and maximum column value.

Tables in these schemas are excluded from view output: `mysql`, `sys`, `INFORMATION_SCHEMA`, `performance_schema`.

The `schema_auto_increment_columns` view has these columns:

- `table_schema`

The schema that contains the table.

- `table_name`

The table that contains the `AUTO_INCREMENT` column.

- `column_name`

The name of the `AUTO_INCREMENT` column.

- `data_type`

The data type of the column.

- `column_type`

The column type of the column, which is the data type plus possibly other information. For example, for a column with a `bigint(20) unsigned` column type, the data type is just `bigint`.

- `is_signed`

Whether the column type is signed.

- `is_unsigned`

Whether the column type is unsigned.

- `max_value`

The maximum permitted value for the column.

- `auto_increment`

The current `AUTO_INCREMENT` value for the column.

- `auto_increment_ratio`

The ratio of used to permitted values for the column. This indicates how much of the sequence of values is “used up.”

### 30.4.3.25 The `schema_index_statistics` and `x$schema_index_statistics` Views

These views provide index statistics. By default, rows are sorted by descending total index latency.

The `schema_index_statistics` and `x$schema_index_statistics` views have these columns:

- `table_schema`

The schema that contains the table.

- `table_name`

The table that contains the index.

- `index_name`

The name of the index.

- `rows_selected`

The total number of rows read using the index.

- `select_latency`

The total wait time of timed reads using the index.

- `rows_inserted`

The total number of rows inserted into the index.

- `insert_latency`

The total wait time of timed inserts into the index.

- `rows_updated`

The total number of rows updated in the index.

- `update_latency`

The total wait time of timed updates in the index.

- `rows_deleted`

The total number of rows deleted from the index.

- `delete_latency`

The total wait time of timed deletes from the index.

#### 30.4.3.26 The `schema_object_overview` View

This view summarizes the types of objects within each schema. By default, rows are sorted by schema and object type.

##### Note

For MySQL instances with a large number of objects, this view might take a long time to execute.

The `schema_object_overview` view has these columns:

- `db`

The schema name.

- `object_type`

The object type: `BASE TABLE`, `INDEX (index_type)`, `EVENT`, `FUNCTION`, `PROCEDURE`, `TRIGGER`, `VIEW`.

- `count`

The number of objects in the schema of the given type.

#### 30.4.3.27 The `schema_redundant_indexes` and `x$schema_flattened_keys` Views

The `schema_redundant_indexes` view displays indexes that duplicate other indexes or are made redundant by them. The `x$schema_flattened_keys` view is a helper view for `schema_redundant_indexes`.

In the following column descriptions, the dominant index is the one that makes the redundant index redundant.

The `schema_redundant_indexes` view has these columns:

- `table_schema`

The schema that contains the table.

- `table_schema`

The table that contains the index.

- `table_name`

The name of the redundant index.

- `redundant_index_name`

The names of the columns in the redundant index.

- `redundant_index_columns`

- `dominant_index_name`

The name of the dominant index.

- `dominant_index_columns`

The names of the columns in the dominant index.

- `dominant_index_non_unique`

The number of nonunique columns in the dominant index.

- `subpart_exists`

Whether the index indexes only part of a column.

- `sql_drop_index`

The statement to execute to drop the redundant index.

The `x$schema_flattened_keys` view has these columns:

- `table_schema`

The schema that contains the table.

- `table_name`

The table that contains the index.

- `index_name`

An index name.

- `non_unique`

The number of nonunique columns in the index.

- `subpart_exists`

Whether the index indexes only part of a column.

- `index_columns`

The name of the columns in the index.

### 30.4.3.28 The schema\_table\_lock\_waits and x\$schema\_table\_lock\_waits Views

These views display which sessions are blocked waiting on metadata locks, and what is blocking them.

The column descriptions here are brief. For additional information, see the description of the Performance Schema `metadata_locks` table at [Section 29.12.13.3, “The metadata\\_locks Table”](#).

The `schema_table_lock_waits` and `x$schema_table_lock_waits` views have these columns:

- `object_schema`

The schema containing the object to be locked.

- `object_name`

The name of the instrumented object.

- `waiting_thread_id`

The thread ID of the thread that is waiting for the lock.

- `waiting_pid`

The processlist ID of the thread that is waiting for the lock.

- `waiting_account`

The account associated with the session that is waiting for the lock.

- `waiting_lock_type`

The type of the waiting lock.

- `waiting_lock_duration`

How long the waiting lock has been waiting.

- `waiting_query`

The statement that is waiting for the lock.

- `waiting_query_secs`

How long the statement has been waiting, in seconds.

- `waiting_query_rows_affected`

The number of rows affected by the statement.

- `waiting_query_rows_examined`

The number of rows read from storage engines by the statement.

- `blocking_thread_id`

The thread ID of the thread that is blocking the waiting lock.

- `blocking_pid`

The processlist ID of the thread that is blocking the waiting lock.

- `blocking_account`

The account associated with the thread that is blocking the waiting lock.

- `blocking_lock_type`

The type of lock that is blocking the waiting lock.

- `blocking_lock_duration`

How long the blocking lock has been held.

- `sql_kill_blocking_query`

The `KILL` statement to execute to kill the blocking statement.

- `sql_kill_blocking_connection`

The `KILL` statement to execute to kill the session running the blocking statement.

### 30.4.3.29 The `schema_table_statistics` and `x$schema_table_statistics` Views

These views summarize table statistics. By default, rows are sorted by descending total wait time (tables with most contention first).

These views user a helper view, `x$ps_schema_table_statistics_io`.

The `schema_table_statistics` and `x$schema_table_statistics` views have these columns:

- `table_schema`

The schema that contains the table.

- `table_name`

The table name.

- `total_latency`

The total wait time of timed I/O events for the table.

- `rows_fetched`

The total number of rows read from the table.

- `fetch_latency`

The total wait time of timed read I/O events for the table.

- `rows_inserted`

The total number of rows inserted into the table.

- `insert_latency`

The total wait time of timed insert I/O events for the table.

- `rows_updated`

The total number of rows updated in the table.

- `update_latency`

The total wait time of timed update I/O events for the table.

- `rows_deleted`

The total number of rows deleted from the table.

- `delete_latency`  
The total wait time of timed delete I/O events for the table.
- `io_read_requests`  
The total number of read requests for the table.
- `io_read`  
The total number of bytes read from the table.
- `io_read_latency`  
The total wait time of reads from the table.
- `io_write_requests`  
The total number of write requests for the table.
- `io_write`  
The total number of bytes written to the table.
- `io_write_latency`  
The total wait time of writes to the table.
- `io_misc_requests`  
The total number of miscellaneous I/O requests for the table.
- `io_misc_latency`  
The total wait time of miscellaneous I/O requests for the table.

### 30.4.3.30 The `schema_table_statistics_with_buffer` and `x$schema_table_statistics_with_buffer` Views

These views summarize table statistics, including `InnoDB` buffer pool statistics. By default, rows are sorted by descending total wait time (tables with most contention first).

These views user a helper view, `x$ps_schema_table_statistics_io`.

The `schema_table_statistics_with_buffer` and `x$schema_table_statistics_with_buffer` views have these columns:

- `table_schema`  
The schema that contains the table.
- `table_name`  
The table name.
- `rows_fetched`  
The total number of rows read from the table.
- `fetch_latency`  
The total wait time of timed read I/O events for the table.
- `rows_inserted`

The total number of rows inserted into the table.

- `insert_latency`

The total wait time of timed insert I/O events for the table.

- `rows_updated`

The total number of rows updated in the table.

- `update_latency`

The total wait time of timed update I/O events for the table.

- `rows_deleted`

The total number of rows deleted from the table.

- `delete_latency`

The total wait time of timed delete I/O events for the table.

- `io_read_requests`

The total number of read requests for the table.

- `io_read`

The total number of bytes read from the table.

- `io_read_latency`

The total wait time of reads from the table.

- `io_write_requests`

The total number of write requests for the table.

- `io_write`

The total number of bytes written to the table.

- `io_write_latency`

The total wait time of writes to the table.

- `io_misc_requests`

The total number of miscellaneous I/O requests for the table.

- `io_misc_latency`

The total wait time of miscellaneous I/O requests for the table.

- `innodb_buffer_allocated`

The total number of `InnoDB` buffer bytes allocated for the table.

- `innodb_buffer_data`

The total number of `InnoDB` data bytes allocated for the table.

- `innodb_buffer_free`

The total number of InnoDB nondata bytes allocated for the table (`innodb_buffer_allocated - innodb_buffer_data`).

- `innodb_buffer_pages`

The total number of InnoDB pages allocated for the table.

- `innodb_buffer_pages_hashed`

The total number of InnoDB hashed pages allocated for the table.

- `innodb_buffer_pages_old`

The total number of InnoDB old pages allocated for the table.

- `innodb_buffer_rows_cached`

The total number of InnoDB cached rows for the table.

### 30.4.3.31 The `schema_tables_with_full_table_scans` and `x$schema_tables_with_full_table_scans` Views

These views display which tables are being accessed with full table scans. By default, rows are sorted by descending rows scanned.

The `schema_tables_with_full_table_scans` and `x$schema_tables_with_full_table_scans` views have these columns:

- `object_schema`

The schema name.

- `object_name`

The table name.

- `rows_full_scanned`

The total number of rows scanned by full scans of the table.

- `latency`

The total wait time of full scans of the table.

### 30.4.3.32 The `schema_unused_indexes` View

These views display indexes for which there are no events, which indicates that they are not being used. By default, rows are sorted by schema and table.

This view is most useful when the server has been up and processing long enough that its workload is representative. Otherwise, presence of an index in this view may not be meaningful.

The `schema_unused_indexes` view has these columns:

- `object_schema`

The schema name.

- `object_name`

The table name.

- `index_name`

The unused index name.

### 30.4.3.33 The session and x\$session Views

These views are similar to `processlist` and `x$processlist`, but they filter out background processes to display only user sessions. For descriptions of the columns, see [Section 30.4.3.22, “The processlist and x\\$processlist Views”](#).

### 30.4.3.34 The session\_ssl\_status View

For each connection, this view displays the SSL version, cipher, and count of reused SSL sessions.

The `session_ssl_status` view has these columns:

- `thread_id`

The thread ID for the connection.

- `ssl_version`

The version of SSL used for the connection.

- `ssl_cipher`

The SSL cipher used for the connection.

- `ssl_sessions_reused`

The number of reused SSL sessions for the connection.

### 30.4.3.35 The statement\_analysis and x\$statement\_analysis Views

These views list normalized statements with aggregated statistics. The content mimics the MySQL Enterprise Monitor Query Analysis view. By default, rows are sorted by descending total latency.

The `statement_analysis` and `x$statement_analysis` views have these columns:

- `query`

The normalized statement string.

- `db`

The default database for the statement, or `NULL` if there is none.

- `full_scan`

The total number of full table scans performed by occurrences of the statement.

- `exec_count`

The total number of times the statement has executed.

- `err_count`

The total number of errors produced by occurrences of the statement.

- `warn_count`

The total number of warnings produced by occurrences of the statement.

- `total_latency`

The total wait time of timed occurrences of the statement.

- `max_latency`

The maximum single wait time of timed occurrences of the statement.

- `avg_latency`

The average wait time per timed occurrence of the statement.

- `lock_latency`

The total time waiting for locks by timed occurrences of the statement.

- `cpu_latency`

The time spent on CPU for the current thread.

- `rows_sent`

The total number of rows returned by occurrences of the statement.

- `rows_sent_avg`

The average number of rows returned per occurrence of the statement.

- `rows_examined`

The total number of rows read from storage engines by occurrences of the statement.

- `rows_examined_avg`

The average number of rows read from storage engines per occurrence of the statement.

- `rows_affected`

The total number of rows affected by occurrences of the statement.

- `rows_affected_avg`

The average number of rows affected per occurrence of the statement.

- `tmp_tables`

The total number of internal in-memory temporary tables created by occurrences of the statement.

- `tmp_disk_tables`

The total number of internal on-disk temporary tables created by occurrences of the statement.

- `rows_sorted`

The total number of rows sorted by occurrences of the statement.

- `sort_merge_passes`

The total number of sort merge passes by occurrences of the statement.

- `max_controlled_memory`

The maximum amount of controlled memory (bytes) used by the statement.

- `max_total_memory`

The maximum amount of memory (bytes) used by the statement.

- `digest`

The statement digest.

- `first_seen`

The time at which the statement was first seen.

- `last_seen`

The time at which the statement was most recently seen.

### 30.4.3.36 The `statements_with_errors_or_warnings` and `x$statements_with_errors_or_warnings` Views

These views display normalized statements that have produced errors or warnings. By default, rows are sorted by descending error and warning counts.

The `statements_with_errors_or_warnings` and `x$statements_with_errors_or_warnings` views have these columns:

- `query`

The normalized statement string.

- `db`

The default database for the statement, or `NULL` if there is none.

- `exec_count`

The total number of times the statement has executed.

- `errors`

The total number of errors produced by occurrences of the statement.

- `error_pct`

The percentage of statement occurrences that produced errors.

- `warnings`

The total number of warnings produced by occurrences of the statement.

- `warning_pct`

The percentage of statement occurrences that produced warnings.

- `first_seen`

The time at which the statement was first seen.

- `last_seen`

The time at which the statement was most recently seen.

- `digest`

The statement digest.

### 30.4.3.37 The statements\_with\_full\_table\_scans and x\$statements\_with\_full\_table\_scans Views

These views display normalized statements that have done full table scans. By default, rows are sorted by descending percentage of time a full scan was done and descending total latency.

The `statements_with_full_table_scans` and `x$statements_with_full_table_scans` views have these columns:

- `query`

The normalized statement string.

- `db`

The default database for the statement, or `NULL` if there is none.

- `exec_count`

The total number of times the statement has executed.

- `total_latency`

The total wait time of timed statement events for the statement.

- `no_index_used_count`

The total number of times no index was used to scan the table.

- `no_good_index_used_count`

The total number of times no good index was used to scan the table.

- `no_index_used_pct`

The percentage of the time no index was used to scan the table.

- `rows_sent`

The total number of rows returned from the table.

- `rows_examined`

The total number of rows read from the storage engine for the table.

- `rows_sent_avg`

The average number of rows returned from the table.

- `rows_examined_avg`

The average number of rows read from the storage engine for the table.

- `first_seen`

The time at which the statement was first seen.

- `last_seen`

The time at which the statement was most recently seen.

- `digest`

The statement digest.

### 30.4.3.38 The `statements_with_runtimes_in_95th_percentile` and `x$statements_with_runtimes_in_95th_percentile` Views

These views list statements with runtimes in the 95th percentile. By default, rows are sorted by descending average latency.

Both views use two helper views, `x$ps_digest_avg_latency_distribution` and `x$ps_digest_95th_percentile_by_avg_us`.

The `statements_with_runtimes_in_95th_percentile` and `x$statements_with_runtimes_in_95th_percentile` views have these columns:

- `query`

The normalized statement string.

- `db`

The default database for the statement, or `NULL` if there is none.

- `full_scan`

The total number of full table scans performed by occurrences of the statement.

- `exec_count`

The total number of times the statement has executed.

- `err_count`

The total number of errors produced by occurrences of the statement.

- `warn_count`

The total number of warnings produced by occurrences of the statement.

- `total_latency`

The total wait time of timed occurrences of the statement.

- `max_latency`

The maximum single wait time of timed occurrences of the statement.

- `avg_latency`

The average wait time per timed occurrence of the statement.

- `rows_sent`

The total number of rows returned by occurrences of the statement.

- `rows_sent_avg`

The average number of rows returned per occurrence of the statement.

- `rows_examined`

The total number of rows read from storage engines by occurrences of the statement.

- `rows_examined_avg`

The average number of rows read from storage engines per occurrence of the statement.

- `first_seen`

The time at which the statement was first seen.

- `last_seen`

The time at which the statement was most recently seen.

- `digest`

The statement digest.

### 30.4.3.39 The `statements_with_sorting` and `x$statements_with_sorting` Views

These views list normalized statements that have performed sorts. By default, rows are sorted by descending total latency.

The `statements_with_sorting` and `x$statements_with_sorting` views have these columns:

- `query`

The normalized statement string.

- `db`

The default database for the statement, or `NULL` if there is none.

- `exec_count`

The total number of times the statement has executed.

- `total_latency`

The total wait time of timed occurrences of the statement.

- `sort_merge_passes`

The total number of sort merge passes by occurrences of the statement.

- `avg_sort_merges`

The average number of sort merge passes per occurrence of the statement.

- `sorts_using_scans`

The total number of sorts using table scans by occurrences of the statement.

- `sort_using_range`

The total number of sorts using range accesses by occurrences of the statement.

- `rows_sorted`

The total number of rows sorted by occurrences of the statement.

- `avg_rows_sorted`

The average number of rows sorted per occurrence of the statement.

- `first_seen`

The time at which the statement was first seen.

- `last_seen`

The time at which the statement was most recently seen.

- `digest`

The statement digest.

#### **30.4.3.40 The statements\_with\_temp\_tables and x\$statements\_with\_temp\_tables Views**

These views list normalized statements that have used temporary tables. By default, rows are sorted by descending number of on-disk temporary tables used and descending number of in-memory temporary tables used.

The `statements_with_temp_tables` and `x$statements_with_temp_tables` views have these columns:

- `query`

The normalized statement string.

- `db`

The default database for the statement, or `NULL` if there is none.

- `exec_count`

The total number of times the statement has executed.

- `total_latency`

The total wait time of timed occurrences of the statement.

- `memory_tmp_tables`

The total number of internal in-memory temporary tables created by occurrences of the statement.

- `disk_tmp_tables`

The total number of internal on-disk temporary tables created by occurrences of the statement.

- `avg_tmp_tables_per_query`

The average number of internal temporary tables created per occurrence of the statement.

- `tmp_tables_to_disk_pct`

The percentage of internal in-memory temporary tables that were converted to on-disk tables.

- `first_seen`

The time at which the statement was first seen.

- `last_seen`

The time at which the statement was most recently seen.

- `digest`

The statement digest.

#### **30.4.3.41 The user\_summary and x\$user\_summary Views**

These views summarize statement activity, file I/O, and connections, grouped by user. By default, rows are sorted by descending total latency.

The `user_summary` and `x$user_summary` views have these columns:

- `user`

The client user name. Rows for which the `USER` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `statements`

The total number of statements for the user.

- `statement_latency`

The total wait time of timed statements for the user.

- `statement_avg_latency`

The average wait time per timed statement for the user.

- `table_scans`

The total number of table scans for the user.

- `file_ios`

The total number of file I/O events for the user.

- `file_io_latency`

The total wait time of timed file I/O events for the user.

- `current_connections`

The current number of connections for the user.

- `total_connections`

The total number of connections for the user.

- `unique_hosts`

The number of distinct hosts from which connections for the user have originated.

- `current_memory`

The current amount of allocated memory for the user.

- `total_memory_allocated`

The total amount of allocated memory for the user.

#### 30.4.3.42 The `user_summary_by_file_io` and `x$user_summary_by_file_io` Views

These views summarize file I/O, grouped by user. By default, rows are sorted by descending total file I/O latency.

The `user_summary_by_file_io` and `x$user_summary_by_file_io` views have these columns:

- `user`

The client user name. Rows for which the `USER` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `ios`

The total number of file I/O events for the user.

- `io_latency`

The total wait time of timed file I/O events for the user.

#### 30.4.3.43 The `user_summary_by_file_io_type` and `x$user_summary_by_file_io_type` Views

These views summarize file I/O, grouped by user and event type. By default, rows are sorted by user and descending total latency.

The `user_summary_by_file_io_type` and `x$user_summary_by_file_io_type` views have these columns:

- `user`

The client user name. Rows for which the `USER` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `event_name`

The file I/O event name.

- `total`

The total number of occurrences of the file I/O event for the user.

- `latency`

The total wait time of timed occurrences of the file I/O event for the user.

- `max_latency`

The maximum single wait time of timed occurrences of the file I/O event for the user.

#### 30.4.3.44 The `user_summary_by_stages` and `x$user_summary_by_stages` Views

These views summarize stages, grouped by user. By default, rows are sorted by user and descending total stage latency.

The `user_summary_by_stages` and `x$user_summary_by_stages` views have these columns:

- `user`

The client user name. Rows for which the `USER` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `event_name`

The stage event name.

- `total`

The total number of occurrences of the stage event for the user.

- `total_latency`

The total wait time of timed occurrences of the stage event for the user.

- `avg_latency`

The average wait time per timed occurrence of the stage event for the user.

#### **30.4.3.45 The `user_summary_by_statement_latency` and `x$user_summary_by_statement_latency` Views**

These views summarize overall statement statistics, grouped by user. By default, rows are sorted by descending total latency.

The `user_summary_by_statement_latency` and `x$user_summary_by_statement_latency` views have these columns:

- `user`

The client user name. Rows for which the `USER` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `total`

The total number of statements for the user.

- `total_latency`

The total wait time of timed statements for the user.

- `max_latency`

The maximum single wait time of timed statements for the user.

- `lock_latency`

The total time waiting for locks by timed statements for the user.

- `cpu_latency`

The time spent on CPU for the current thread.

- `rows_sent`

The total number of rows returned by statements for the user.

- `rows_examined`

The total number of rows read from storage engines by statements for the user.

- `rows_affected`

The total number of rows affected by statements for the user.

- `full_scans`

The total number of full table scans by statements for the user.

#### **30.4.3.46 The `user_summary_by_statement_type` and `x$user_summary_by_statement_type` Views**

These views summarize information about statements executed, grouped by user and statement type. By default, rows are sorted by user and descending total latency.

The `user_summary_by_statement_type` and `x$user_summary_by_statement_type` views have these columns:

- [user](#)

The client user name. Rows for which the `USER` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- [statement](#)

The final component of the statement event name.

- [total](#)

The total number of occurrences of the statement event for the user.

- [total\\_latency](#)

The total wait time of timed occurrences of the statement event for the user.

- [max\\_latency](#)

The maximum single wait time of timed occurrences of the statement event for the user.

- [lock\\_latency](#)

The total time waiting for locks by timed occurrences of the statement event for the user.

- [cpu\\_latency](#)

The time spent on CPU for the current thread.

- [rows\\_sent](#)

The total number of rows returned by occurrences of the statement event for the user.

- [rows\\_examined](#)

The total number of rows read from storage engines by occurrences of the statement event for the user.

- [rows\\_affected](#)

The total number of rows affected by occurrences of the statement event for the user.

- [full\\_scans](#)

The total number of full table scans by occurrences of the statement event for the user.

### 30.4.3.47 The `version` View

This view provides the current `sys` schema and MySQL server versions.

**Note**

This view is deprecated, and subject to removal in a future MySQL version. Applications that use it should be migrated to use an alternative instead. For example, use the `VERSION()` function to retrieve the MySQL server version.

The `version` view has these columns:

- [sys\\_version](#)

The `sys` schema version.

- [mysql\\_version](#)

The MySQL server version.

### 30.4.3.48 The `wait_classes_global_by_avg_latency` and `x$wait_classes_global_by_avg_latency` Views

These views summarize wait class average latencies, grouped by event class. By default, rows are sorted by descending average latency. Idle events are ignored.

An event class is determined by stripping from the event name everything after the first three components. For example, the class for `wait/io/file/sql/slow_log` is `wait/io/file`.

The `wait_classes_global_by_avg_latency` and `x$wait_classes_global_by_avg_latency` views have these columns:

- `event_class`

The event class.

- `total`

The total number of occurrences of events in the class.

- `total_latency`

The total wait time of timed occurrences of events in the class.

- `min_latency`

The minimum single wait time of timed occurrences of events in the class.

- `avg_latency`

The average wait time per timed occurrence of events in the class.

- `max_latency`

The maximum single wait time of timed occurrences of events in the class.

### 30.4.3.49 The `wait_classes_global_by_latency` and `x$wait_classes_global_by_latency` Views

These views summarize wait class total latencies, grouped by event class. By default, rows are sorted by descending total latency. Idle events are ignored.

An event class is determined by stripping from the event name everything after the first three components. For example, the class for `wait/io/file/sql/slow_log` is `wait/io/file`.

The `wait_classes_global_by_latency` and `x$wait_classes_global_by_latency` views have these columns:

- `event_class`

The event class.

- `total`

The total number of occurrences of events in the class.

- `total_latency`

The total wait time of timed occurrences of events in the class.

- `min_latency`

The minimum single wait time of timed occurrences of events in the class.

- `avg_latency`

The average wait time per timed occurrence of events in the class.

- `max_latency`

The maximum single wait time of timed occurrences of events in the class.

### 30.4.3.50 The `waits_by_host_by_latency` and `x$waits_by_host_by_latency` Views

These views summarize wait events, grouped by host and event. By default, rows are sorted by host and descending total latency. Idle events are ignored.

The `waits_by_host_by_latency` and `x$waits_by_host_by_latency` views have these columns:

- `host`

The host from which the connection originated.

- `event`

The event name.

- `total`

The total number of occurrences of the event for the host.

- `total_latency`

The total wait time of timed occurrences of the event for the host.

- `avg_latency`

The average wait time per timed occurrence of the event for the host.

- `max_latency`

The maximum single wait time of timed occurrences of the event for the host.

### 30.4.3.51 The `waits_by_user_by_latency` and `x$waits_by_user_by_latency` Views

These views summarize wait events, grouped by user and event. By default, rows are sorted by user and descending total latency. Idle events are ignored.

The `waits_by_user_by_latency` and `x$waits_by_user_by_latency` views have these columns:

- `user`

The user associated with the connection.

- `event`

The event name.

- `total`

The total number of occurrences of the event for the user.

- `total_latency`

The total wait time of timed occurrences of the event for the user.

- `avg_latency`

The average wait time per timed occurrence of the event for the user.

- `max_latency`

The maximum single wait time of timed occurrences of the event for the user.

### 30.4.3.52 The `waits_global_by_latency` and `x$waits_global_by_latency` Views

These views summarize wait events, grouped by event. By default, rows are sorted by descending total latency. Idle events are ignored.

The `waits_global_by_latency` and `x$waits_global_by_latency` views have these columns:

- `events`

The event name.

- `total`

The total number of occurrences of the event.

- `total_latency`

The total wait time of timed occurrences of the event.

- `avg_latency`

The average wait time per timed occurrence of the event.

- `max_latency`

The maximum single wait time of timed occurrences of the event.

## 30.4.4 sys Schema Stored Procedures

The following sections describe `sys` schema stored procedures.

### 30.4.4.1 The `create_synonym_db()` Procedure

Given a schema name, this procedure creates a synonym schema containing views that refer to all the tables and views in the original schema. This can be used, for example, to create a shorter name by which to refer to a schema with a long name (such as `info` rather than `INFORMATION_SCHEMA`).

#### Parameters

- `in_db_name` `VARCHAR(64)`: The name of the schema for which to create the synonym.
- `in_synonym` `VARCHAR(64)`: The name to use for the synonym schema. This schema must not already exist.

#### Example

```
mysql> SHOW DATABASES;
+-----+
| Database |
+-----+
| information_schema |
| mysql |
| performance_schema |
| sys |
```

```

| world |
+-----+
mysql> CALL sys.create_synonym_db('INFORMATION_SCHEMA', 'info');
+-----+
| summary |
+-----+
| Created 63 views in the info database |
+-----+
mysql> SHOW DATABASES;
+-----+
| Database |
+-----+
| information_schema |
| info |
| mysql |
| performance_schema |
| sys |
| world |
+-----+
mysql> SHOW FULL TABLES FROM info;
+-----+-----+
| Tables_in_info | Table_type |
+-----+-----+
| character_sets | VIEW |
| collation_character_set_applicability | VIEW |
| collations | VIEW |
| column_privileges | VIEW |
| columns | VIEW |
...

```

### 30.4.4.2 The diagnostics() Procedure

Creates a report of the current server status for diagnostic purposes.

This procedure disables binary logging during its execution by manipulating the session value of the `sql_log_bin` system variable. That is a restricted operation, so the procedure requires privileges sufficient to set restricted session variables. See [Section 7.1.9.1, “System Variable Privileges”](#).

Data collected for `diagnostics()` includes this information:

- Information from the `metrics` view (see [Section 30.4.3.21, “The metrics View”](#))
- Information from other relevant `sys` schema views, such as the one that determines queries in the 95th percentile
- Information from the `ndbinfo` schema, if the MySQL server is part of NDB Cluster
- Replication status (both source and replica)

Some of the `sys` schema views are calculated as initial (optional), overall, and delta values:

- The initial view is the content of the view at the start of the `diagnostics()` procedure. This output is the same as the start values used for the delta view. The initial view is included if the `diagnostics.include_raw` configuration option is `ON`.
- The overall view is the content of the view at the end of the `diagnostics()` procedure. This output is the same as the end values used for the delta view. The overall view is always included.
- The delta view is the difference from the beginning to the end of procedure execution. The minimum and maximum values are the minimum and maximum values from the end view, respectively. They do not necessarily reflect the minimum and maximum values in the monitored period. Except for the `metrics` view, the delta is calculated only between the first and last outputs.

### Parameters

- `in_max_runtime INT UNSIGNED`: The maximum data collection time in seconds. Use `NULL` to collect data for the default of 60 seconds. Otherwise, use a value greater than 0.

- `in_interval INT UNSIGNED`: The sleep time between data collections in seconds. Use `NULL` to sleep for the default of 30 seconds. Otherwise, use a value greater than 0.
- `in_auto_config ENUM('current', 'medium', 'full')`: The Performance Schema configuration to use. Permitted values are:
  - `current`: Use the current instrument and consumer settings.
  - `medium`: Enable some instruments and consumers.
  - `full`: Enable all instruments and consumers.

**Note**

The more instruments and consumers enabled, the more impact on MySQL server performance. Be careful with the `medium` setting and especially the `full` setting, which has a large performance impact.

Use of the `medium` or `full` setting requires the `SUPER` privilege.

If a setting other than `current` is chosen, the current settings are restored at the end of the procedure.

## Configuration Options

`diagnostics()` operation can be modified using the following configuration options or their corresponding user-defined variables (see [Section 30.4.2.1, “The sys\\_config Table”](#)):

- `debug, @sys.debug`

If this option is `ON`, produce debugging output. The default is `OFF`.

- `diagnostics.allow_i_s_tables, @sys.diagnostics.allow_i_s_tables`

If this option is `ON`, the `diagnostics()` procedure is permitted to perform table scans on the Information Schema `TABLES` table. This can be expensive if there are many tables. The default is `OFF`.

- `diagnostics.include_raw, @sys.diagnostics.include_raw`

If this option is `ON`, the `diagnostics()` procedure output includes the raw output from querying the `metrics` view. The default is `OFF`.

- `statement_truncate_len, @sys.statement_truncate_len`

The maximum length of statements returned by the `format_statement()` function. Longer statements are truncated to this length. The default is 64.

## Example

Create a diagnostics report that starts an iteration every 30 seconds and runs for at most 120 seconds using the current Performance Schema settings:

```
mysql> CALL sys.diagnostics(120, 30, 'current');
```

To capture the output from the `diagnostics()` procedure in a file as it runs, use the `mysql` client `tee filename` and `notee` commands (see [Section 6.5.1.2, “mysql Client Commands”](#)):

```
mysql> tee diag.out;
mysql> CALL sys.diagnostics(120, 30, 'current');
mysql> notee;
```

### 30.4.4.3 The `execute_prepared_stmt()` Procedure

Given an SQL statement as a string, executes it as a prepared statement. The prepared statement is deallocated after execution, so it is not subject to reuse. Thus, this procedure is useful primarily for executing dynamic statements on a one-time basis.

This procedure uses `sys.execute_prepared_stmt` as the prepared statement name. If that statement name exists when the procedure is called, its previous content is destroyed.

## Parameters

- `in_query LONGTEXT CHARACTER SET utf8mb3`: The statement string to execute.

## Configuration Options

`execute_prepared_stmt()` operation can be modified using the following configuration options or their corresponding user-defined variables (see [Section 30.4.2.1, “The sys\\_config Table”](#)):

- `debug, @sys.debug`

If this option is `ON`, produce debugging output. The default is `OFF`.

## Example

```
mysql> CALL sys.execute_prepared_stmt('SELECT COUNT(*) FROM mysql.user');
+-----+
| COUNT(*) |
+-----+
| 15 |
+-----+
```

### 30.4.4.4 The `ps_setup_disable_background_threads()` Procedure

Disables Performance Schema instrumentation for all background threads. Produces a result set indicating how many background threads were disabled. Already disabled threads do not count.

## Parameters

None.

## Example

```
mysql> CALL sys.ps_setup_disable_background_threads();
+-----+
| summary |
+-----+
| Disabled 24 background threads |
+-----+
```

### 30.4.4.5 The `ps_setup_disable_consumer()` Procedure

Disables Performance Schema consumers with names that contain the argument. Produces a result set indicating how many consumers were disabled. Already disabled consumers do not count.

## Parameters

- `consumer VARCHAR(128)`: The value used to match consumer names, which are identified by using `%consumer%` as an operand for a `LIKE` pattern match.

A value of `''` matches all consumers.

## Example

Disable all statement consumers:

```
mysql> CALL sys.ps_setup_disable_consumer('statement');
+-----+
| summary |
+-----+
| Disabled 4 consumers |
+-----+
```

### 30.4.4.6 The ps\_setup\_disable\_instrument() Procedure

Disables Performance Schema instruments with names that contain the argument. Produces a result set indicating how many instruments were disabled. Already disabled instruments do not count.

#### Parameters

- `in_pattern VARCHAR(128)`: The value used to match instrument names, which are identified by using `%in_pattern%` as an operand for a `LIKE` pattern match.

A value of '`'`' matches all instruments.

#### Example

Disable a specific instrument:

```
mysql> CALL sys.ps_setup_disable_instrument('wait/lock/metadata/sql/mdl');
+-----+
| summary |
+-----+
| Disabled 1 instrument |
+-----+
```

Disable all mutex instruments:

```
mysql> CALL sys.ps_setup_disable_instrument('mutex');
+-----+
| summary |
+-----+
| Disabled 177 instruments |
+-----+
```

### 30.4.4.7 The ps\_setup\_disable\_thread() Procedure

Given a connection ID, disables Performance Schema instrumentation for the thread. Produces a result set indicating how many threads were disabled. Already disabled threads do not count.

#### Parameters

- `in_connection_id BIGINT`: The connection ID. This is a value of the type given in the `PROCESSLIST_ID` column of the Performance Schema `threads` table or the `Id` column of `SHOW PROCESSLIST` output.

#### Example

Disable a specific connection by its connection ID:

```
mysql> CALL sys.ps_setup_disable_thread(225);
+-----+
| summary |
+-----+
| Disabled 1 thread |
+-----+
```

Disable the current connection:

```
mysql> CALL sys.ps_setup_disable_thread(CONNECTION_ID());
+-----+
| summary |
+-----+
| Disabled 1 thread |
+-----+
```

### 30.4.4.8 The ps\_setup\_enable\_background\_threads() Procedure

Enables Performance Schema instrumentation for all background threads. Produces a result set indicating how many background threads were enabled. Already enabled threads do not count.

#### Parameters

None.

#### Example

```
mysql> CALL sys.ps_setup_enable_background_threads();
+-----+
| summary |
+-----+
| Enabled 24 background threads |
+-----+
```

### 30.4.4.9 The ps\_setup\_enable\_consumer() Procedure

Enables Performance Schema consumers with names that contain the argument. Produces a result set indicating how many consumers were enabled. Already enabled consumers do not count.

#### Parameters

- `consumer` `VARCHAR(128)`: The value used to match consumer names, which are identified by using `%consumer%` as an operand for a `LIKE` pattern match.

A value of '`'`' matches all consumers.

#### Example

Enable all statement consumers:

```
mysql> CALL sys.ps_setup_enable_consumer('statement');
+-----+
| summary |
+-----+
| Enabled 4 consumers |
+-----+
```

### 30.4.4.10 The ps\_setup\_enable\_instrument() Procedure

Enables Performance Schema instruments with names that contain the argument. Produces a result set indicating how many instruments were enabled. Already enabled instruments do not count.

#### Parameters

- `in_pattern` `VARCHAR(128)`: The value used to match instrument names, which are identified by using `%in_pattern%` as an operand for a `LIKE` pattern match.

A value of '`'`' matches all instruments.

#### Example

Enable a specific instrument:

```
mysql> CALL sys.ps_setup_enable_instrument('wait/lock/metadata/sql/mdl');
+-----+
| summary |
+-----+
| Enabled 1 instrument |
+-----+
```

Enable all mutex instruments:

```
mysql> CALL sys.ps_setup_enable_instrument('mutex');
+-----+
| summary |
+-----+
| Enabled 177 instruments |
+-----+
```

#### 30.4.4.11 The ps\_setup\_enable\_thread() Procedure

Given a connection ID, enables Performance Schema instrumentation for the thread. Produces a result set indicating how many threads were enabled. Already enabled threads do not count.

##### Parameters

- `in_connection_id BIGINT`: The connection ID. This is a value of the type given in the `PROCESSLIST_ID` column of the Performance Schema `threads` table or the `Id` column of `SHOW PROCESSLIST` output.

##### Example

Enable a specific connection by its connection ID:

```
mysql> CALL sys.ps_setup_enable_thread(225);
+-----+
| summary |
+-----+
| Enabled 1 thread |
+-----+
```

Enable the current connection:

```
mysql> CALL sys.ps_setup_enable_thread(CONNECTION_ID());
+-----+
| summary |
+-----+
| Enabled 1 thread |
+-----+
```

#### 30.4.4.12 The ps\_setup\_reload\_saved() Procedure

Reloads a Performance Schema configuration saved earlier within the same session using `ps_setup_save()`. For more information, see the description of `ps_setup_save()`.

This procedure disables binary logging during its execution by manipulating the session value of the `sql_log_bin` system variable. That is a restricted operation, so the procedure requires privileges sufficient to set restricted session variables. See [Section 7.1.9.1, “System Variable Privileges”](#).

##### Parameters

None.

#### 30.4.4.13 The ps\_setup\_reset\_to\_default() Procedure

Resets the Performance Schema configuration to its default settings.

## Parameters

- `in_verbose BOOLEAN`: Whether to display information about each setup stage during procedure execution. This includes the SQL statements executed.

## Example

```
mysql> CALL sys.ps_setup_reset_to_default(TRUE)\G
***** 1. row *****
status: Resetting: setup_actors
DELETE
FROM performance_schema.setup_actors
WHERE NOT (HOST = '%' AND USER = '%' AND ROLE = '%')

***** 1. row *****
status: Resetting: setup_actors
INSERT IGNORE INTO performance_schema.setup_actors
VALUES ('%', '%', '%')
...
```

### 30.4.4.14 The `ps_setup_save()` Procedure

Saves the current Performance Schema configuration. This enables you to alter the configuration temporarily for debugging or other purposes, then restore it to the previous state by invoking the `ps_setup_reload_saved()` procedure.

To prevent other simultaneous calls to save the configuration, `ps_setup_save()` acquires an advisory lock named `sys.ps_setup_save` by calling the `GET_LOCK()` function. `ps_setup_save()` takes a timeout parameter to indicate how many seconds to wait if the lock already exists (which indicates that some other session has a saved configuration outstanding). If the timeout expires without obtaining the lock, `ps_setup_save()` fails.

It is intended you call `ps_setup_reload_saved()` later within the *same* session as `ps_setup_save()` because the configuration is saved in `TEMPORARY` tables. `ps_setup_save()` drops the temporary tables and releases the lock. If you end your session without invoking `ps_setup_save()`, the tables and lock disappear automatically.

This procedure disables binary logging during its execution by manipulating the session value of the `sql_log_bin` system variable. That is a restricted operation, so the procedure requires privileges sufficient to set restricted session variables. See [Section 7.1.9.1, “System Variable Privileges”](#).

## Parameters

- `in_timeout INT`: How many seconds to wait to obtain the `sys.ps_setup_save` lock. A negative timeout value means infinite timeout.

## Example

```
mysql> CALL sys.ps_setup_save(10);
... make Performance Schema configuration changes ...
mysql> CALL sys.ps_setup_reload_saved();
```

### 30.4.4.15 The `ps_setup_show_disabled()` Procedure

Displays all currently disabled Performance Schema configuration.

## Parameters

- `in_show_instruments BOOLEAN`: Whether to display disabled instruments. This might be a long list.
- `in_show_threads BOOLEAN`: Whether to display disabled threads.

**Example**

```
mysql> CALL sys.ps_setup_show_disabled(TRUE, TRUE);
+-----+
| performance_schema_enabled |
+-----+
| 1 |
+-----+

+-----+
| enabled_users |
+-----+
| '%'@'%' |
+-----+

+-----+-----+-----+-----+
| object_type | objects | enabled | timed |
+-----+-----+-----+-----+
| EVENT | mysql.% | NO | NO |
| EVENT | performance_schema.% | NO | NO |
| EVENT | information_schema.% | NO | NO |
| FUNCTION | mysql.% | NO | NO |
| FUNCTION | performance_schema.% | NO | NO |
| FUNCTION | information_schema.% | NO | NO |
| PROCEDURE | mysql.% | NO | NO |
| PROCEDURE | performance_schema.% | NO | NO |
| PROCEDURE | information_schema.% | NO | NO |
| TABLE | mysql.% | NO | NO |
| TABLE | performance_schema.% | NO | NO |
| TABLE | information_schema.% | NO | NO |
| TRIGGER | mysql.% | NO | NO |
| TRIGGER | performance_schema.% | NO | NO |
| TRIGGER | information_schema.% | NO | NO |
+-----+-----+-----+-----+
...

```

**30.4.4.16 The ps\_setup\_show\_disabled\_consumers() Procedure**

Displays all currently disabled Performance Schema consumers.

**Parameters**

None.

**Example**

```
mysql> CALL sys.ps_setup_show_disabled_consumers();
+-----+
| disabled_consumers |
+-----+
| events_stages_current |
| events_stages_history |
| events_stages_history_long |
| events_statements_history |
| events_statements_history_long |
| events_transactions_history |
| events_transactions_history_long |
| events_waits_current |
| events_waits_history |
| events_waits_history_long |
+-----+
```

**30.4.4.17 The ps\_setup\_show\_disabled\_instruments() Procedure**

Displays all currently disabled Performance Schema instruments. This might be a long list.

**Parameters**

None.

## Example

```
mysql> CALL sys.ps_setup_show_disabled_instruments()\G
***** 1. row *****
disabled_instruments: wait/synch/mutex/sql/TC_LOG_MMAP::LOCK_tc
timed: NO
***** 2. row *****
disabled_instruments: wait/synch/mutex/sql/THD::LOCK_query_plan
timed: NO
***** 3. row *****
disabled_instruments: wait/synch/mutex/sql/MYSQL_BIN_LOG::LOCK_commit
timed: NO
...
```

### 30.4.4.18 The ps\_setup\_show\_enabled() Procedure

Displays all currently enabled Performance Schema configuration.

#### Parameters

- `in_show_instruments BOOLEAN`: Whether to display enabled instruments. This might be a long list.
- `in_show_threads BOOLEAN`: Whether to display enabled threads.

## Example

```
mysql> CALL sys.ps_setup_show_enabled(FALSE, FALSE);
+-----+
| performance_schema_enabled |
+-----+
| 1 |
+-----+
1 row in set (0.01 sec)

+-----+
| enabled_users |
+-----+
| '%'@'%' |
+-----+
1 row in set (0.01 sec)

+-----+-----+-----+-----+
| object_type | objects | enabled | timed |
+-----+-----+-----+-----+
| EVENT | %.% | YES | YES |
| FUNCTION | %.% | YES | YES |
| PROCEDURE | %.% | YES | YES |
| TABLE | %.% | YES | YES |
| TRIGGER | %.% | YES | YES |
+-----+-----+-----+-----+
5 rows in set (0.02 sec)

+-----+
| enabled_consumers |
+-----+
| events_statements_current |
| events_statements_history |
| events_transactions_current |
| events_transactions_history |
| global_instrumentation |
| statements_digest |
| thread_instrumentation |
+-----+
```

### 30.4.4.19 The ps\_setup\_show\_enabled\_consumers() Procedure

Displays all currently enabled Performance Schema consumers.

## Parameters

None.

## Example

```
mysql> CALL sys.ps_setup_show_enabled_consumers();
+-----+
| enabled_consumers |
+-----+
| events_statements_current |
| events_statements_history |
| events_transactions_current |
| events_transactions_history |
| global_instrumentation |
| statements_digest |
| thread_instrumentation |
+-----+
```

### 30.4.4.20 The ps\_setup\_show\_enabled\_instruments() Procedure

Displays all currently enabled Performance Schema instruments. This might be a long list.

## Parameters

None.

## Example

```
mysql> CALL sys.ps_setup_show_enabled_instruments()\G
***** 1. row *****
enabled_instruments: wait/io/file/sql/map
timed: YES
***** 2. row *****
enabled_instruments: wait/io/file/sql/binlog
timed: YES
***** 3. row *****
enabled_instruments: wait/io/file/sql/binlog_cache
timed: YES
...
```

### 30.4.4.21 The ps\_statement\_avg\_latency\_histogram() Procedure

Displays a textual histogram graph of the average latency values across all normalized statements tracked within the Performance Schema `events_statements_summary_by_digest` table.

This procedure can be used to display a very high-level picture of the latency distribution of statements running within this MySQL instance.

## Parameters

None.

## Example

The histogram output in statement units. For example, `* = 2 units` in the histogram legend means that each `*` character represents 2 statements.

```
mysql> CALL sys.ps_statement_avg_latency_histogram()\G
***** 1. row *****
Performance Schema Statement Digest Average Latency Histogram:

. = 1 unit
* = 2 units
= 3 units
```

```
(0 - 66ms) 88 | #####
(66 - 133ms) 14 |
(133 - 199ms) 4 |
(199 - 265ms) 5 | **
(265 - 332ms) 1 | .
(332 - 398ms) 0 |
(398 - 464ms) 1 | .
(464 - 531ms) 0 |
(531 - 597ms) 0 |
(597 - 663ms) 0 |
(663 - 730ms) 0 |
(730 - 796ms) 0 |
(796 - 863ms) 0 |
(863 - 929ms) 0 |
(929 - 995ms) 0 |
(995 - 1062ms) 0 |

Total Statements: 114; Buckets: 16; Bucket Size: 66 ms;
```

### 30.4.4.22 The ps\_trace\_statement\_digest() Procedure

Traces all Performance Schema instrumentation for a specific statement digest.

If you find a statement of interest within the Performance Schema `events_statements_summary_by_digest` table, specify its `DIGEST` column MD5 value to this procedure and indicate the polling duration and interval. The result is a report of all statistics tracked within Performance Schema for that digest for the interval.

The procedure also attempts to execute `EXPLAIN` for the longest running example of the digest during the interval. This attempt might fail because the Performance Schema truncates long `SQL_TEXT` values. Consequently, `EXPLAIN` fails, due to parse errors.

This procedure disables binary logging during its execution by manipulating the session value of the `sql_log_bin` system variable. That is a restricted operation, so the procedure requires privileges sufficient to set restricted session variables. See [Section 7.1.9.1, “System Variable Privileges”](#).

#### Parameters

- `in_digest VARCHAR(32)`: The statement digest identifier to analyze.
- `in_runtime INT`: How long to run the analysis in seconds.
- `in_interval DECIMAL(2,2)`: The analysis interval in seconds (which can be fractional) at which to try to take snapshots.
- `in_start_fresh BOOLEAN`: Whether to truncate the Performance Schema `events_statements_history_long` and `events_stages_history_long` tables before starting.
- `in_auto_enable BOOLEAN`: Whether to automatically enable required consumers.

#### Example

```
mysql> CALL sys.ps_trace_statement_digest('891ec6860f98ba46d89dd20b0c03652c', 10, 0.1, TRUE, TRUE);
+-----+

```

### 30.4.4.23 The ps\_trace\_thread() Procedure

Dumps all Performance Schema data for an instrumented thread to a `.dot` formatted graph file (for the DOT graph description language). Each result set returned from the procedure should be used for a complete graph.

This procedure disables binary logging during its execution by manipulating the session value of the `sql_log_bin` system variable. That is a restricted operation, so the procedure requires privileges sufficient to set restricted session variables. See [Section 7.1.9.1, “System Variable Privileges”](#).

#### Parameters

- `in_thread_id INT`: The thread to trace.

- `in_outfile VARCHAR(255)`: The name to use for the `.dot` output file.
- `in_max_runtime DECIMAL(20,2)`: The maximum number of seconds (which can be fractional) to collect data. Use `NULL` to collect data for the default of 60 seconds.
- `in_interval DECIMAL(20,2)`: The number of seconds (which can be fractional) to sleep between data collections. Use `NULL` to sleep for the default of 1 second.
- `in_start_fresh BOOLEAN`: Whether to reset all Performance Schema data before tracing.
- `in_auto_setup BOOLEAN`: Whether to disable all other threads and enable all instruments and consumers. This also resets the settings at the end of the run.
- `in_debug BOOLEAN`: Whether to include `file:lineno` information in the graph.

## Example

```
mysql> CALL sys.ps_trace_thread(25, CONCAT('/tmp/stack-', REPLACE(NOW(), ' ', '-'), '.dot'), NULL, NULL, TRUE);
+-----+
| summary |
+-----+
| Disabled 1 thread |
+-----+
1 row in set (0.00 sec)

+-----+
| Info |
+-----+
| Data collection starting for THREAD_ID = 25 |
+-----+
1 row in set (0.03 sec)

+-----+
| Info |
+-----+
| Stack trace written to /tmp/stack-2014-02-16-21:18:41.dot |
+-----+
1 row in set (60.07 sec)

+-----+
| Convert to PDF |
+-----+
| dot -Tpdf -o /tmp/stack_25.pdf /tmp/stack-2014-02-16-21:18:41.dot |
+-----+
1 row in set (60.07 sec)

+-----+
| Convert to PNG |
+-----+
| dot -Tpng -o /tmp/stack_25.png /tmp/stack-2014-02-16-21:18:41.dot |
+-----+
1 row in set (60.07 sec)

+-----+
| summary |
+-----+
| Enabled 1 thread |
+-----+
1 row in set (60.32 sec)
```

### 30.4.4.24 The `ps_truncate_all_tables()` Procedure

Truncates all Performance Schema summary tables, resetting all aggregated instrumentation as a snapshot. Produces a result set indicating how many tables were truncated.

#### Parameters

- `in_verbose BOOLEAN`: Whether to display each `TRUNCATE TABLE` statement before executing it.

## Example

```
mysql> CALL sys.ps_truncate_all_tables(FALSE);
+-----+
| summary |
+-----+
| Truncated 49 tables |
+-----+
```

### 30.4.4.25 The statement\_performance\_analyzer() Procedure

Creates a report of the statements running on the server. The views are calculated based on the overall and/or delta activity.

This procedure disables binary logging during its execution by manipulating the session value of the `sql_log_bin` system variable. That is a restricted operation, so the procedure requires privileges sufficient to set restricted session variables. See [Section 7.1.9.1, “System Variable Privileges”](#).

## Parameters

- `in_action` `ENUM('snapshot', 'overall', 'delta', 'create_tmp', 'create_table', 'save', 'cleanup')`: The action to take. These values are permitted:
  - `snapshot`: Store a snapshot. The default is to make a snapshot of the current content of the Performance Schema `events_statements_summary_by_digest` table. By setting `in_table`, this can be overwritten to copy the content of the specified table. The snapshot is stored in the `sys` schema `tmp_digests` temporary table.
  - `overall`: Generate an analysis based on the content of the table specified by `in_table`. For the overall analysis, `in_table` can be `NOW()` to use a fresh snapshot. This overwrites an existing snapshot. Use `NULL` for `in_table` to use the existing snapshot. If `in_table` is `NULL` and no snapshot exists, a new snapshot is created. The `in_views` parameter and the `statement_performance_analyzer.limit` configuration option affect the operation of this procedure.
  - `delta`: Generate a delta analysis. The delta is calculated between the reference table specified by `in_table` and the snapshot, which must exist. This action uses the `sys` schema `tmp_digests_delta` temporary table. The `in_views` parameter and the `statement_performance_analyzer.limit` configuration option affect the operation of this procedure.
  - `create_table`: Create a regular table suitable for storing the snapshot for later use (for example, for calculating deltas).
  - `create_tmp`: Create a temporary table suitable for storing the snapshot for later use (for example, for calculating deltas).
  - `save`: Save the snapshot in the table specified by `in_table`. The table must exist and have the correct structure. If no snapshot exists, a new snapshot is created.
  - `cleanup`: Remove the temporary tables used for the snapshot and delta.
- `in_table` `VARCHAR(129)`: The table parameter used for some of the actions specified by the `in_action` parameter. Use the format `db_name.tbl_name` or `tbl_name` without using any backtick (`) identifier-quoting characters. Periods (.) are not supported in database and table names.

The meaning of the `in_table` value for each `in_action` value is detailed in the individual `in_action` value descriptions.

- `in_views` `SET ('with_runtimes_in_95th_percentile', 'analysis', 'with_errors_or_warnings', 'with_full_table_scans', 'with_sorting',`

'with\_temp\_tables', 'custom'): Which views to include. This parameter is a `SET` value, so it can contain multiple view names, separated by commas. The default is to include all views except `custom`. The following values are permitted:

- `with_runtimes_in_95th_percentile`: Use the `statements_with_runtimes_in_95th_percentile` view.
- `analysis`: Use the `statement_analysis` view.
- `with_errors_or_warnings`: Use the `statements_with_errors_or_warnings` view.
- `with_full_table_scans`: Use the `statements_with_full_table_scans` view.
- `with_sorting`: Use the `statements_with_sorting` view.
- `with_temp_tables`: Use the `statements_with_temp_tables` view.
- `custom`: Use a custom view. This view must be specified using the `statement_performance_analyzer.view` configuration option to name a query or an existing view.

## Configuration Options

`statement_performance_analyzer()` operation can be modified using the following configuration options or their corresponding user-defined variables (see [Section 30.4.2.1, “The sys\\_config Table”](#)):

- `debug, @sys.debug`

If this option is `ON`, produce debugging output. The default is `OFF`.

- `statement_performance_analyzer.limit, @sys.statement_performance_analyzer.limit`

The maximum number of rows to return for views that have no built-in limit. The default is 100.

- `statement_performance_analyzer.view, @sys.statement_performance_analyzer.view`

The custom query or view to be used. If the option value contains a space, it is interpreted as a query. Otherwise, it must be the name of an existing view that queries the Performance Schema `events_statements_summary_by_digest` table. There cannot be any `LIMIT` clause in the query or view definition if the `statement_performance_analyzer.limit` configuration option is greater than 0. If specifying a view, use the same format as for the `in_table` parameter. The default is `NULL` (no custom view defined).

## Example

To create a report with the queries in the 95th percentile since the last truncation of `events_statements_summary_by_digest` and with a one-minute delta period:

1. Create a temporary table to store the initial snapshot.
2. Create the initial snapshot.
3. Save the initial snapshot in the temporary table.
4. Wait one minute.
5. Create a new snapshot.
6. Perform analysis based on the new snapshot.
7. Perform analysis based on the delta between the initial and new snapshots.

```

mysql> CALL sys.statement_performance_analyzer('create_tmp', 'mydb.tmp_digests_ini', NULL);
Query OK, 0 rows affected (0.08 sec)

mysql> CALL sys.statement_performance_analyzer('snapshot', NULL, NULL);
Query OK, 0 rows affected (0.02 sec)

mysql> CALL sys.statement_performance_analyzer('save', 'mydb.tmp_digests_ini', NULL);
Query OK, 0 rows affected (0.00 sec)

mysql> DO SLEEP(60);
Query OK, 0 rows affected (1 min 0.00 sec)

mysql> CALL sys.statement_performance_analyzer('snapshot', NULL, NULL);
Query OK, 0 rows affected (0.02 sec)

mysql> CALL sys.statement_performance_analyzer('overall', NULL, 'with_runtimes_in_95th_percentile');
+-----+
| Next Output |
+-----+
| Queries with Runtime in 95th Percentile |
+-----+
1 row in set (0.05 sec)

...
mysql> CALL sys.statement_performance_analyzer('delta', 'mydb.tmp_digests_ini', 'with_runtimes_in_95th_percentile');
+-----+
| Next Output |
+-----+
| Queries with Runtime in 95th Percentile |
+-----+
1 row in set (0.03 sec)

...

```

Create an overall report of the 95th percentile queries and the top 10 queries with full table scans:

```

mysql> CALL sys.statement_performance_analyzer('snapshot', NULL, NULL);
Query OK, 0 rows affected (0.01 sec)

mysql> SET @sys.statement_performance_analyzer.limit = 10;
Query OK, 0 rows affected (0.00 sec)

mysql> CALL sys.statement_performance_analyzer('overall', NULL, 'with_runtimes_in_95th_percentile,with_runtimes_in_99th_percentile');
+-----+
| Next Output |
+-----+
| Queries with Runtime in 95th Percentile |
+-----+
1 row in set (0.01 sec)

...
+-----+
| Next Output |
+-----+
| Top 10 Queries with Full Table Scan |
+-----+
1 row in set (0.09 sec)

...

```

Use a custom view showing the top 10 queries sorted by total execution time, refreshing the view every minute using the `watch` command in Linux:

```

mysql> CREATE OR REPLACE VIEW mydb.my_statements AS
 SELECT sys.format_statement(DIGEST_TEXT) AS query,
 SCHEMA_NAME AS db,
 COUNT_STAR AS exec_count,
 sys.format_time(SUM_TIMER_WAIT) AS total_latency,
 sys.format_time(AVG_TIMER_WAIT) AS avg_latency,
 ROUND(IFNULL(SUM_ROWS_SENT / NULLIF(COUNT_STAR, 0), 0)) AS rows_sent_avg,

```

```

 ROUND(IFNULL(SUM_ROWS_EXAMINED / NULLIF(COUNT_STAR, 0), 0)) AS rows_examined_avg,
 ROUND(IFNULL(SUM_ROWS_AFFECTED / NULLIF(COUNT_STAR, 0), 0)) AS rows_affected_avg,
 DIGEST AS digest
 FROM performance_schema.events_statements_summary_by_digest
 ORDER BY SUM_TIMER_WAIT DESC;
Query OK, 0 rows affected (0.10 sec)

mysql> CALL sys.statement_performance_analyzer('create_table', 'mydb.digests_prev', NULL);
Query OK, 0 rows affected (0.10 sec)

$> watch -n 60 "mysql sys --table -e \
> SET @sys.statement_performance_analyzer.view = 'mydb.my_statements';
> SET @sys.statement_performance_analyzer.limit = 10;
> CALL statement_performance_analyzer('snapshot', NULL, NULL);
> CALL statement_performance_analyzer('delta', 'mydb.digests_prev', 'custom');
> CALL statement_performance_analyzer('save', 'mydb.digests_prev', NULL);
> \"""

Every 60.0s: mysql sys --table -e " ... Mon Dec 22 10:58:51 2014
+-----+
| Next Output |
+-----+
| Top 10 Queries Using Custom View |
+-----+
| query | db | exec_count | total_latency | avg_latency | rows_sent_avg | rows_examined_avg
+-----+-----+-----+-----+-----+-----+
| | | | | | | |
...
```

### 30.4.4.26 The table\_exists() Procedure

Tests whether a given table exists as a regular table, a `TEMPORARY` table, or a view. The procedure returns the table type in an `OUT` parameter. If both a temporary and a permanent table exist with the given name, `TEMPORARY` is returned.

#### Parameters

- `in_db` `VARCHAR(64)`: The name of the database in which to check for table existence.
- `in_table` `VARCHAR(64)`: The name of the table to check the existence of.
- `out_exists` `ENUM(' ', 'BASE TABLE', 'VIEW', 'TEMPORARY')`: The return value. This is an `OUT` parameter, so it must be a variable into which the table type can be stored. When the procedure returns, the variable has one of the following values to indicate whether the table exists:
  - `' '`: The table name does not exist as a base table, `TEMPORARY` table, or view.
  - `BASE TABLE`: The table name exists as a base (permanent) table.
  - `VIEW`: The table name exists as a view.
  - `TEMPORARY`: The table name exists as a `TEMPORARY` table.

#### Example

```

mysql> CREATE DATABASE db1;
Query OK, 1 row affected (0.01 sec)

mysql> USE db1;
Database changed

mysql> CREATE TABLE t1 (id INT PRIMARY KEY);
Query OK, 0 rows affected (0.03 sec)

mysql> CREATE TABLE t2 (id INT PRIMARY KEY);
Query OK, 0 rows affected (0.20 sec)
```

```

mysql> CREATE view v_t1 AS SELECT * FROM t1;
Query OK, 0 rows affected (0.02 sec)

mysql> CREATE TEMPORARY TABLE t1 (id INT PRIMARY KEY);
Query OK, 0 rows affected (0.00 sec)

mysql> CALL sys.table_exists('db1', 't1', @exists); SELECT @exists;
Query OK, 0 rows affected (0.01 sec)

+-----+
| @exists |
+-----+
| TEMPORARY |
+-----+
1 row in set (0.00 sec)

mysql> CALL sys.table_exists('db1', 't2', @exists); SELECT @exists;
Query OK, 0 rows affected (0.02 sec)

+-----+
| @exists |
+-----+
| BASE TABLE |
+-----+
1 row in set (0.00 sec)

mysql> CALL sys.table_exists('db1', 'v_t1', @exists); SELECT @exists;
Query OK, 0 rows affected (0.02 sec)

+-----+
| @exists |
+-----+
| VIEW |
+-----+
1 row in set (0.00 sec)

mysql> CALL sys.table_exists('db1', 't3', @exists); SELECT @exists;
Query OK, 0 rows affected (0.00 sec)

+-----+
| @exists |
+-----+
| |
+-----+
1 row in set (0.00 sec)

```

## 30.4.5 sys Schema Stored Functions

The following sections describe `sys` schema stored functions.

### 30.4.5.1 The `extract_schema_from_file_name()` Function

Given a file path name, returns the path component that represents the schema name. This function assumes that the file name lies within the schema directory. For this reason, it does not work with partitions or tables defined using their own `DATA_DIRECTORY` table option.

This function is useful when extracting file I/O information from the Performance Schema that includes file path names. It provides a convenient way to display schema names, which can be more easily understood than full path names, and can be used in joins against object schema names.

#### Parameters

- `path` `VARCHAR(512)`: The full path to a data file from which to extract the schema name.

#### Return Value

A `VARCHAR(64)` value.

## Example

```
mysql> SELECT sys.extract_schema_from_file_name('/usr/local/mysql/data/world/City.ibd');
+-----+
| sys.extract_schema_from_file_name('/usr/local/mysql/data/world/City.ibd') |
+-----+
| world |
+-----+
```

### 30.4.5.2 The extract\_table\_from\_file\_name() Function

Given a file path name, returns the path component that represents the table name.

This function is useful when extracting file I/O information from the Performance Schema that includes file path names. It provides a convenient way to display table names, which can be more easily understood than full path names, and can be used in joins against object table names.

## Parameters

- `path` `VARCHAR(512)`: The full path to a data file from which to extract the table name.

## Return Value

A `VARCHAR(64)` value.

## Example

```
mysql> SELECT sys.extract_table_from_file_name('/usr/local/mysql/data/world/City.ibd');
+-----+
| sys.extract_table_from_file_name('/usr/local/mysql/data/world/City.ibd') |
+-----+
| City |
+-----+
```

### 30.4.5.3 The format\_bytes() Function

#### Note

`format_bytes()` is deprecated, and subject to removal in a future MySQL version. Applications that use it should be migrated to use the built-in `FORMAT_BYTES()` function instead. See [Section 14.21, “Performance Schema Functions”](#)

Given a byte count, converts it to human-readable format and returns a string consisting of a value and a units indicator. Depending on the size of the value, the units part is `bytes`, `KiB` (kilobytes), `MiB` (mebibytes), `GiB` (gibibytes), `TiB` (tebibytes), or `PiB` (pebibytes).

## Parameters

- `bytes` `TEXT`: The byte count to format.

## Return Value

A `TEXT` value.

## Example

```
mysql> SELECT sys.format_bytes(512), sys.format_bytes(18446644073709551615);
+-----+-----+
| sys.format_bytes(512) | sys.format_bytes(18446644073709551615) |
+-----+-----+
| 512 bytes | 16383.91 PiB |
+-----+-----+
```

### 30.4.5.4 The format\_path() Function

Given a path name, returns the modified path name after replacing subpaths that match the values of the following system variables, in order:

```
datadir
tmpdir
replica_load_tmpdir
innodb_data_home_dir
innodb_log_group_home_dir
innodb_undo_directory
basedir
```

A value that matches the value of system variable `sysvar` is replaced with the string `@@GLOBAL.sysvar`.

## Parameters

- `path` `VARCHAR(512)`: The path name to format.

## Return Value

A `VARCHAR(512)` `CHARACTER SET utf8mb3` value.

## Example

```
mysql> SELECT sys.format_path('/usr/local/mysql/data/world/City.ibd');
+-----+
| sys.format_path('/usr/local/mysql/data/world/City.ibd') |
+-----+
| @@datadir/world/City.ibd |
+-----+
```

### 30.4.5.5 The `format_statement()` Function

Given a string (normally representing an SQL statement), reduces it to the length given by the `statement_truncate_len` configuration option, and returns the result. No truncation occurs if the string is shorter than `statement_truncate_len`. Otherwise, the middle part of the string is replaced by an ellipsis (...).

This function is useful for formatting possibly lengthy statements retrieved from Performance Schema tables to a known fixed maximum length.

## Parameters

- `statement` `LONGTEXT`: The statement to format.

## Configuration Options

`format_statement()` operation can be modified using the following configuration options or their corresponding user-defined variables (see [Section 30.4.2.1, “The `sys\_config` Table”](#)):

- `statement_truncate_len`, `@sys.statement_truncate_len`

The maximum length of statements returned by the `format_statement()` function. Longer statements are truncated to this length. The default is 64.

## Return Value

A `LONGTEXT` value.

## Example

By default, `format_statement()` truncates statements to be no more than 64 characters. Setting `@sys.statement_truncate_len` changes the truncation length for the current session:

```
mysql> SET @stmt = 'SELECT variable, value, set_time, set_by FROM sys_config';
```

```
mysql> SELECT sys.format_statement(@stmt);
+-----+
| sys.format_statement(@stmt) |
+-----+
| SELECT variable, value, set_time, set_by FROM sys_config |
+-----+
mysql> SET @sys.statement_truncate_len = 32;
mysql> SELECT sys.format_statement(@stmt);
+-----+
| sys.format_statement(@stmt) |
+-----+
| SELECT variabl ... ROM sys_config |
+-----+
```

### 30.4.5.6 The format\_time() Function

#### Note

`format_time()` is deprecated, and subject to removal in a future MySQL version. Applications that use it should be migrated to use the built-in `FORMAT_PICO_TIME()` function instead. See [Section 14.21, “Performance Schema Functions”](#)

Given a Performance Schema latency or wait time in picoseconds, converts it to human-readable format and returns a string consisting of a value and a units indicator. Depending on the size of the value, the units part is `ps` (picoseconds), `ns` (nanoseconds), `us` (microseconds), `ms` (milliseconds), `s` (seconds), `m` (minutes), `h` (hours), `d` (days), or `w` (weeks).

#### Parameters

- `picoseconds TEXT`: The picoseconds value to format.

#### Return Value

A `TEXT` value.

#### Example

```
mysql> SELECT sys.format_time(3501), sys.format_time(188732396662000);
+-----+-----+
| sys.format_time(3501) | sys.format_time(188732396662000) |
+-----+-----+
| 3.50 ns | 3.15 m |
+-----+-----+
```

### 30.4.5.7 The list\_add() Function

Adds a value to a comma-separated list of values and returns the result.

This function and `list_drop()` can be useful for manipulating the value of system variables such as `sql_mode` and `optimizer_switch` that take a comma-separated list of values.

#### Parameters

- `in_list TEXT`: The list to be modified.
- `in_add_value TEXT`: The value to add to the list.

#### Return Value

A `TEXT` value.

#### Example

```

mysql> SELECT @@sql_mode;
+-----+
| @@sql_mode |
+-----+
| ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES |
+-----+
mysql> SET @@sql_mode = sys.list_add(@@sql_mode, 'NO_ENGINE_SUBSTITUTION');
mysql> SELECT @@sql_mode;
+-----+
| @@sql_mode |
+-----+
| ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES,NO_ENGINE_SUBSTITUTION |
+-----+
mysql> SET @@sql_mode = sys.list_drop(@@sql_mode, 'ONLY_FULL_GROUP_BY');
mysql> SELECT @@sql_mode;
+-----+
| @@sql_mode |
+-----+
| STRICT_TRANS_TABLES,NO_ENGINE_SUBSTITUTION |
+-----+

```

### 30.4.5.8 The `list_drop()` Function

Removes a value from a comma-separated list of values and returns the result. For more information, see the description of [list\\_add\(\)](#)

#### Parameters

- `in_list TEXT`: The list to be modified.
- `in_drop_value TEXT`: The value to drop from the list.

#### Return Value

A `TEXT` value.

### 30.4.5.9 The `ps_is_account_enabled()` Function

Returns `YES` or `NO` to indicate whether Performance Schema instrumentation for a given account is enabled.

#### Parameters

- `in_host VARCHAR(60)`: The host name of the account to check.
- `in_user VARCHAR(32)`: The user name of the account to check.

#### Return Value

An `ENUM('YES', 'NO')` value.

#### Example

```

mysql> SELECT sys.ps_is_account_enabled('localhost', 'root');
+-----+
| sys.ps_is_account_enabled('localhost', 'root') |
+-----+
| YES |
+-----+

```

### 30.4.5.10 The `ps_is_consumer_enabled()` Function

Returns `YES` or `NO` to indicate whether a given Performance Schema consumer is enabled, or `NULL` if the argument is `NULL`. If the argument is not a valid consumer name, an error occurs.

This function accounts for the consumer hierarchy, so a consumer is not considered enabled unless all consumers on which depends are also enabled. For information about the consumer hierarchy, see [Section 29.4.7, “Pre-Filtering by Consumer”](#).

## Parameters

- `in_consumer VARCHAR(64)`: The name of the consumer to check.

## Return Value

An `ENUM('YES', 'NO')` value.

## Example

```
mysql> SELECT sys.ps_is_consumer_enabled('thread_instrumentation');
+-----+
| sys.ps_is_consumer_enabled('thread_instrumentation') |
+-----+
| YES
+-----+
```

### 30.4.5.11 The `ps_is_instrument_default_enabled()` Function

Returns `YES` or `NO` to indicate whether a given Performance Schema instrument is enabled by default.

## Parameters

- `in_instrument VARCHAR(128)`: The name of the instrument to check.

## Return Value

An `ENUM('YES', 'NO')` value.

## Example

```
mysql> SELECT sys.ps_is_instrument_default_enabled('memory/innodb/row_log_buf');
+-----+
| sys.ps_is_instrument_default_enabled('memory/innodb/row_log_buf') |
+-----+
| NO
+-----+
mysql> SELECT sys.ps_is_instrument_default_enabled('statement/sql/alter_user');
+-----+
| sys.ps_is_instrument_default_enabled('statement/sql/alter_user') |
+-----+
| YES
+-----+
```

### 30.4.5.12 The `ps_is_instrument_default_timed()` Function

Returns `YES` or `NO` to indicate whether a given Performance Schema instrument is timed by default.

## Parameters

- `in_instrument VARCHAR(128)`: The name of the instrument to check.

## Return Value

An `ENUM('YES', 'NO')` value.

## Example

```
mysql> SELECT sys.ps_is_instrument_default_timed('memory/innodb/row_log_buf');
+-----+
```

```

| sys.ps_is_instrument_default_timed('memory/innodb/row_log_buf') |
+-----+
| NO
+-----+
mysql> SELECT sys.ps_is_instrument_default_timed('statement/sql/alter_user');
+-----+
| sys.ps_is_instrument_default_timed('statement/sql/alter_user') |
+-----+
| YES
+-----+

```

### 30.4.5.13 The ps\_is\_thread\_instrumented() Function

Returns `YES` or `NO` to indicate whether Performance Schema instrumentation for a given connection ID is enabled, `UNKNOWN` if the ID is unknown, or `NULL` if the ID is `NULL`.

#### Parameters

- `in_connection_id BIGINT UNSIGNED`: The connection ID. This is a value of the type given in the `PROCESSLIST_ID` column of the Performance Schema `threads` table or the `Id` column of `SHOW PROCESSLIST` output.

#### Return Value

An `ENUM( 'YES' , 'NO' , 'UNKNOWN' )` value.

#### Example

```

mysql> SELECT sys.ps_is_thread_instrumented(43);
+-----+
| sys.ps_is_thread_instrumented(43) |
+-----+
| UNKNOWN
+-----+
mysql> SELECT sys.ps_is_thread_instrumented(CONNECTION_ID());
+-----+
| sys.ps_is_thread_instrumented(CONNECTION_ID()) |
+-----+
| YES
+-----+

```

### 30.4.5.14 The ps\_thread\_account() Function

Given a Performance Schema thread ID, returns the `user_name@host_name` account associated with the thread.

#### Parameters

- `in_thread_id BIGINT UNSIGNED`: The thread ID for which to return the account. The value should match the `THREAD_ID` column from some Performance Schema `threads` table row.

#### Return Value

A `TEXT` value.

#### Example

```

mysql> SELECT sys.ps_thread_account(sys.ps_thread_id(CONNECTION_ID()));
+-----+
| sys.ps_thread_account(sys.ps_thread_id(CONNECTION_ID())) |
+-----+
| root@localhost
+-----+

```

### 30.4.5.15 The ps\_thread\_id() Function

**Note**

`ps_thread_id()` is deprecated, and subject to removal in a future MySQL version. Applications that use it should be migrated to use the built-in `PS_THREAD_ID()` and `PS_CURRENT_THREAD_ID()` functions instead. See [Section 14.21, “Performance Schema Functions”](#)

Returns the Performance Schema thread ID assigned to a given connection ID, or the thread ID for the current connection if the connection ID is `NULL`.

**Parameters**

- `in_connection_id BIGINT UNSIGNED`: The ID of the connection for which to return the thread ID. This is a value of the type given in the `PROCESSLIST_ID` column of the Performance Schema `threads` table or the `Id` column of `SHOW PROCESSLIST` output.

**Return Value**

A `BIGINT UNSIGNED` value.

**Example**

```
mysql> SELECT sys.ps_thread_id(260);
+-----+
| sys.ps_thread_id(260) |
+-----+
| 285 |
+-----+
```

### 30.4.5.16 The `ps_thread_stack()` Function

Returns a JSON formatted stack of all statements, stages, and events within the Performance Schema for a given thread ID.

**Parameters**

- `in_thread_id BIGINT`: The ID of the thread to trace. The value should match the `THREAD_ID` column from some Performance Schema `threads` table row.
- `in_verbose BOOLEAN`: Whether to include `file:lineno` information in the events.

**Return Value**

A `LONGTEXT CHARACTER SET latin1` value.

**Example**

```
mysql> SELECT sys.ps_thread_stack(37, FALSE) AS thread_stack\G
***** 1. row *****
thread_stack: {"rankdir": "LR", "nodesep": "0.10",
"stack_created": "2014-02-19 13:39:03", "mysql_version": "8.4.0-tr",
"mysql_user": "root@localhost", "events": [{"nesting_event_id": "0",
"event_id": "10", "timer_wait": 256.35, "event_info": "sql/select",
"wait_info": "select @@version_comment limit 1\nerrors: 0\nwarnings: 0\nlock time:
..."}]
```

### 30.4.5.17 The `ps_thread_trx_info()` Function

Returns a JSON object containing information about a given thread. The information includes the current transaction, and the statements it has already executed, derived from the Performance Schema `events_transactions_current` and `events_statements_history` tables. (The consumers for those tables must be enabled to obtain full data in the JSON object.)

If the output exceeds the truncation length (65535 by default), a JSON error object is returned, such as:

```
{ "error": "Trx info truncated: Row 6 was cut by GROUP_CONCAT()" }
```

Similar error objects are returned for other warnings and exceptions raised during function execution.

## Parameters

- `in_thread_id BIGINT UNSIGNED`: The thread ID for which to return transaction information. The value should match the `THREAD_ID` column from some Performance Schema `threads` table row.

## Configuration Options

`ps_thread_trx_info()` operation can be modified using the following configuration options or their corresponding user-defined variables (see [Section 30.4.2.1, “The sys\\_config Table”](#)):

- `ps_thread_trx_info.max_length`, `@sys.ps_thread_trx_info.max_length`

The maximum length of the output. The default is 65535.

## Return Value

A `LONGTEXT` value.

## Example

```
mysql> SELECT sys.ps_thread_trx_info(48)\G
***** 1. row *****
sys.ps_thread_trx_info(48): [
 {
 "time": "790.70 us",
 "state": "COMMITTED",
 "mode": "READ WRITE",
 "autocommitted": "NO",
 "gtid": "AUTOMATIC",
 "isolation": "REPEATABLE READ",
 "statements_executed": [
 {
 "sql_text": "INSERT INTO info VALUES (1, \\'foo\\')",
 "time": "471.02 us",
 "schema": "trx",
 "rows_examined": 0,
 "rows_affected": 1,
 "rows_sent": 0,
 "tmp_tables": 0,
 "tmp_disk_tables": 0,
 "sort_rows": 0,
 "sort_merge_passes": 0
 },
 {
 "sql_text": "COMMIT",
 "time": "254.42 us",
 "schema": "trx",
 "rows_examined": 0,
 "rows_affected": 0,
 "rows_sent": 0,
 "tmp_tables": 0,
 "tmp_disk_tables": 0,
 "sort_rows": 0,
 "sort_merge_passes": 0
 }
],
 {
 "time": "426.20 us",
 "state": "COMMITTED",
 "mode": "READ WRITE",
 "autocommitted": "NO",
 "gtid": "AUTOMATIC",
 }
 }
]
```

```
"isolation": "REPEATABLE READ",
"statements_executed": [
 {
 "sql_text": "INSERT INTO info VALUES (2, \\'bar\\')",
 "time": "107.33 us",
 "schema": "trx",
 "rows_examined": 0,
 "rows_affected": 1,
 "rows_sent": 0,
 "tmp_tables": 0,
 "tmp_disk_tables": 0,
 "sort_rows": 0,
 "sort_merge_passes": 0
 },
 {
 "sql_text": "COMMIT",
 "time": "213.23 us",
 "schema": "trx",
 "rows_examined": 0,
 "rows_affected": 0,
 "rows_sent": 0,
 "tmp_tables": 0,
 "tmp_disk_tables": 0,
 "sort_rows": 0,
 "sort_merge_passes": 0
 }
]
}
```

### 30.4.5.18 The `quote_identifier()` Function

Given a string argument, this function produces a quoted identifier suitable for inclusion in SQL statements. This is useful when a value to be used as an identifier is a reserved word or contains backtick (`) characters.

#### Parameters

`in_identifier TEXT`: The identifier to quote.

#### Return Value

A `TEXT` value.

#### Example

```
mysql> SELECT sys.quote_identifier('plain');
+-----+
| sys.quote_identifier('plain') |
+-----+
| `plain` |
+-----+
mysql> SELECT sys.quote_identifier('trick`ier');
+-----+
| sys.quote_identifier('trick`ier') |
+-----+
| `trick``ier` |
+-----+
mysql> SELECT sys.quote_identifier('integer');
+-----+
| sys.quote_identifier('integer') |
+-----+
| `integer` |
+-----+
```

### 30.4.5.19 The `sys_get_config()` Function

Given a configuration option name, returns the option value from the `sys_config` table, or the provided default value (which may be `NULL`) if the option does not exist in the table.

If `sys_get_config()` returns the default value and that value is `NULL`, it is expected that the caller is able to handle `NULL` for the given configuration option.

By convention, routines that call `sys_get_config()` first check whether the corresponding user-defined variable exists and is non-`NULL`. If so, the routine uses the variable value without reading the `sys_config` table. If the variable does not exist or is `NULL`, the routine reads the option value from the table and sets the user-defined variable to that value. For more information about the relationship between configuration options and their corresponding user-defined variables, see [Section 30.4.2.1, “The sys\\_config Table”](#).

If you want to check whether the configuration option has already been set and, if not, use the return value of `sys_get_config()`, you can use `IFNULL(...)` (see example later). However, this should not be done inside a loop (for example, for each row in a result set) because for repeated calls where the assignment is needed only in the first iteration, using `IFNULL(...)` is expected to be significantly slower than using an `IF (...) THEN ... END IF;` block (see example later).

## Parameters

- `in_variable_name VARCHAR(128)`: The name of the configuration option for which to return the value.
- `in_default_value VARCHAR(128)`: The default value to return if the configuration option is not found in the `sys_config` table.

## Return Value

A `VARCHAR(128)` value.

## Example

Get a configuration value from the `sys_config` table, falling back to 128 as the default if the option is not present in the table:

```
mysql> SELECT sys.sys_get_config('statement_truncate_len', 128) AS Value;
+-----+
| Value |
+-----+
| 64 |
+-----+
```

One-liner example: Check whether the option is already set; if not, assign the `IFNULL(...)` result (using the value from the `sys_config` table):

```
mysql> SET @sys.statement_truncate_len =
 IFNULL(@sys.statement_truncate_len,
 sys.sys_get_config('statement_truncate_len', 64));
```

`IF (...) THEN ... END IF;` block example: Check whether the option is already set; if not, assign the value from the `sys_config` table:

```
IF (@sys.statement_truncate_len IS NULL) THEN
 SET @sys.statement_truncate_len = sys.sys_get_config('statement_truncate_len', 64);
END IF;
```

## 30.4.5.20 The version\_major() Function

This function returns the major version of the MySQL server.

## Parameters

None.

## Return Value

A `TINYINT UNSIGNED` value.

## Example

```
mysql> SELECT VERSION(), sys.version_major();
+-----+-----+
| VERSION() | sys.version_major() |
+-----+-----+
| 8.4.2 | 8 |
+-----+-----+
```

### 30.4.5.21 The version\_minor() Function

This function returns the minor version of the MySQL server.

#### Parameters

None.

#### Return Value

A `TINYINT UNSIGNED` value.

## Example

```
mysql> SELECT VERSION(), sys.version_minor();
+-----+-----+
| VERSION() | sys.version_minor() |
+-----+-----+
| 8.4.2 | 4 |
+-----+-----+
```

### 30.4.5.22 The version\_patch() Function

This function returns the patch release version of the MySQL server.

#### Parameters

None.

#### Return Value

A `TINYINT UNSIGNED` value.

## Example

```
mysql> SELECT VERSION(), sys.version_patch();
+-----+-----+
| VERSION() | sys.version_patch() |
+-----+-----+
| 8.4.2 | 2 |
+-----+-----+
```

# Chapter 31 Connectors and APIs

## Table of Contents

31.1 MySQL Connector/C++ .....	5053
31.2 MySQL Connector/J .....	5054
31.3 MySQL Connector/.NET .....	5054
31.4 MySQL Connector/ODBC .....	5054
31.5 MySQL Connector/Python .....	5054
31.6 MySQL Connector/Node.js .....	5054
31.7 MySQL C API .....	5054
31.8 MySQL PHP API .....	5054
31.9 MySQL Perl API .....	5054
31.10 MySQL Python API .....	5055
31.11 MySQL Ruby APIs .....	5055
31.11.1 The MySQL/Ruby API .....	5056
31.11.2 The Ruby/MySQL API .....	5056
31.12 MySQL Tcl API .....	5056
31.13 MySQL Eiffel Wrapper .....	5056

MySQL Connectors provide connectivity to the MySQL server for client programs. APIs provide low-level access to MySQL resources using either the classic MySQL protocol or X Protocol. Both Connectors and the APIs enable you to connect and execute MySQL statements from another language or environment, including ODBC, Java (JDBC), C++, Python, Node.js, PHP, Perl, Ruby, and C.

## MySQL Connectors

Oracle develops a number of connectors:

- [Connector/C++](#) enables C++ applications to connect to MySQL.
- [Connector/J](#) provides driver support for connecting to MySQL from Java applications using the standard Java Database Connectivity (JDBC) API.
- [Connector/.NET](#) enables developers to create .NET applications that connect to MySQL. Connector/.NET implements a fully functional ADO.NET interface and provides support for use with ADO.NET aware tools. Applications that use Connector/.NET can be written in any supported .NET language.
- [Connector/ODBC](#) provides driver support for connecting to MySQL using the Open Database Connectivity (ODBC) API. Support is available for ODBC connectivity from Windows, Unix, and macOS platforms.
- [Connector/Python](#) provides driver support for connecting to MySQL from Python applications using an API that is compliant with the [Python DB API version 2.0](#). No additional Python modules or MySQL client libraries are required.
- [Connector/Node.js](#) provides an asynchronous API for connecting to MySQL from Node.js applications using X Protocol. Connector/Node.js supports managing database sessions and schemas, working with MySQL Document Store collections and using raw SQL statements.

## The MySQL C API

For direct access to using MySQL natively within a C application, the [C API](#) provides low-level access to the MySQL client/server protocol through the [libmysqlclient](#) client library. This is the primary method used to connect to an instance of the MySQL server, and is used both by MySQL command-line clients and many of the MySQL Connectors and third-party APIs detailed here.

`libmysqlclient` is included in MySQL distributions distributions.

See also [MySQL C API Implementations](#).

To access MySQL from a C application, or to build an interface to MySQL for a language not supported by the Connectors or APIs in this chapter, the [C API](#) is where to start. A number of programmer's utilities are available to help with the process; see [Section 6.7, “Program Development Utilities”](#).

## Third-Party MySQL APIs

The remaining APIs described in this chapter provide an interface to MySQL from specific application languages. These third-party solutions are not developed or supported by Oracle. Basic information on their usage and abilities is provided here for reference purposes only.

All the third-party language APIs are developed using one of two methods, using `libmysqlclient` or by implementing a *native driver*. The two solutions offer different benefits:

- Using `libmysqlclient` offers complete compatibility with MySQL because it uses the same libraries as the MySQL client applications. However, the feature set is limited to the implementation and interfaces exposed through `libmysqlclient` and the performance may be lower as data is copied between the native language, and the MySQL API components.
- *Native drivers* are an implementation of the MySQL network protocol entirely within the host language or environment. Native drivers are fast, as there is less copying of data between components, and they can offer advanced functionality not available through the standard MySQL API. Native drivers are also easier for end users to build and deploy because no copy of the MySQL client libraries is needed to build the native driver components.

[Table 31.1, “MySQL APIs and Interfaces”](#) lists many of the libraries and interfaces available for MySQL.

**Table 31.1 MySQL APIs and Interfaces**

Environment	API	Type	Notes
Ada	GNU Ada MySQL Bindings	<code>libmysqlclient</code>	See <a href="#">MySQL Bindings for GNU Ada</a>
C	C API	<code>libmysqlclient</code>	See <a href="#">MySQL 8.4 C API Developer Guide</a> .
C++	Connector/C++	<code>libmysqlclient</code>	See <a href="#">MySQL Connector/C++ 9.4 Developer Guide</a> .
	MySQL++	<code>libmysqlclient</code>	See <a href="#">MySQL++ website</a> .
	MySQL wrapped	<code>libmysqlclient</code>	See <a href="#">MySQL wrapped</a> .
Cocoa	MySQL-Cocoa	<code>libmysqlclient</code>	Compatible with the Objective-C Cocoa environment. See <a href="http://mysql-cocoa.sourceforge.net/">http://mysql-cocoa.sourceforge.net/</a>
D	MySQL for D	<code>libmysqlclient</code>	See <a href="#">MySQL for D</a> .
Eiffel	Eiffel MySQL	<code>libmysqlclient</code>	See <a href="#">Section 31.13, “MySQL Eiffel Wrapper”</a> .
Erlang	<code>erlang-mysql-driver</code>	<code>libmysqlclient</code>	See <a href="#">erlang-mysql-driver</a> .
Haskell	Haskell MySQL Bindings	Native Driver	See <a href="#">Brian O'Sullivan's pure Haskell MySQL bindings</a> .

Environment	API	Type	Notes
	<code>hsql-mysql</code>	<code>libmysqlclient</code>	See <a href="#">MySQL driver for Haskell</a> .
Java/JDBC	Connector/J	Native Driver	See <a href="#">MySQL Connector/J Developer Guide</a> .
Kaya	MyDB	<code>libmysqlclient</code>	See <a href="#">MyDB</a> .

Ruby	mysql2	<code>libmysqlclient</code>	Uses <code>libmysqlclient</code> . See <a href="#">Section 31.11, “MySQL Ruby APIs”</a> .
Scheme	Myscsh	<code>libmysqlclient</code>	See <a href="#">Myscsh</a> .
SPL	sql_mysql	<code>libmysqlclient</code>	See <a href="#">sql_mysql for SPL</a> .
Tcl	MySQLtcl	<code>libmysqlclient</code>	See <a href="#">Section 31.12, “MySQL Tcl API”</a> .

## 31.1 MySQL Connector/C++

The MySQL Connector/C++ manual is published in standalone form, not as part of the MySQL Reference Manual. For information, see these documents:

- Main manual: [MySQL Connector/C++ 9.4 Developer Guide](#)

- Release notes: [MySQL Connector/C++ Release Notes](#)

## 31.2 MySQL Connector/J

The MySQL Connector/J manual is published in standalone form, not as part of the MySQL Reference Manual. For information, see these documents:

- Main manual: [MySQL Connector/J Developer Guide](#)
- Release notes: [MySQL Connector/J Release Notes](#)

## 31.3 MySQL Connector/.NET

The MySQL Connector/.NET manual is published in standalone form, not as part of the MySQL Reference Manual. For information, see these documents:

- Main manual: [MySQL Connector/.NET Developer Guide](#)
- Release notes: [MySQL Connector/.NET Release Notes](#)

## 31.4 MySQL Connector/ODBC

The MySQL Connector/ODBC manual is published in standalone form, not as part of the MySQL Reference Manual. For information, see these documents:

- Main manual: [MySQL Connector/ODBC Developer Guide](#)
- Release notes: [MySQL Connector/ODBC Release Notes](#)

## 31.5 MySQL Connector/Python

The MySQL Connector/Python manual is published in standalone form, not as part of the MySQL Reference Manual. For information, see these documents:

- Main manual: [MySQL Connector/Python Developer Guide](#)
- Release notes: [MySQL Connector/Python Release Notes](#)

## 31.6 MySQL Connector/Node.js

The MySQL Connector/Node.js manual is published in standalone form, not as part of the MySQL Reference Manual. For information, see these documents:

- Release notes: [MySQL Connector/Node.js Release Notes](#)

## 31.7 MySQL C API

The MySQL C API Developer Guide is published in standalone form, not as part of the MySQL Reference Manual. See [MySQL 8.4 C API Developer Guide](#).

## 31.8 MySQL PHP API

The MySQL PHP API manual is now published in standalone form, not as part of the MySQL Reference Manual. See [MySQL and PHP](#).

## 31.9 MySQL Perl API

The Perl `DBI` module provides a generic interface for database access. You can write a DBI script that works with many different database engines without change. To use DBI with MySQL, install the following:

1. The `DBI` module.
2. The `DBD::mysql` module. This is the DataBase Driver (DBD) module for Perl.
3. Optionally, the DBD module for any other type of database server you want to access.

Perl DBI is the recommended Perl interface. It replaces an older interface called `mysqlperl`, which should be considered obsolete.

These sections contain information about using Perl with MySQL and writing MySQL applications in Perl:

- For installation instructions for Perl DBI support, see [Section 2.10, “Perl Installation Notes”](#).
- For an example of reading options from option files, see [Section 7.8.4, “Using Client Programs in a Multiple-Server Environment”](#).
- For secure coding tips, see [Section 8.1.1, “Security Guidelines”](#).
- For debugging tips, see [Section 7.9.1.4, “Debugging mysqld under gdb”](#).
- For some Perl-specific environment variables, see [Section 6.9, “Environment Variables”](#).
- For considerations for running on macOS, see [Section 2.4, “Installing MySQL on macOS”](#).
- For ways to quote string literals, see [Section 11.1.1, “String Literals”](#).

DBI information is available at the command line, online, or in printed form:

- Once you have the `DBI` and `DBD::mysql` modules installed, you can get information about them at the command line with the `perldoc` command:

```
$> perldoc DBI
$> perldoc DBI::FAQ
$> perldoc DBD::mysql
```

You can also use `pod2man`, `pod2html`, and so on to translate this information into other formats.

- For online information about Perl DBI, visit the DBI website, <http://dbi.perl.org/>. That site hosts a general DBI mailing list.
- For printed information, the official DBI book is *Programming the Perl DBI* (Alligator Descartes and Tim Bunce, O'Reilly & Associates, 2000). Information about the book is available at the DBI website, <http://dbi.perl.org/>.

## 31.10 MySQL Python API

`MySQLDb` is a third-party driver that provides MySQL support for Python, compliant with the Python DB API version 2.0. It can be found at <http://sourceforge.net/projects/mysql-python/>.

The new MySQL Connector/Python component provides an interface to the same Python API, and is built into the MySQL Server and supported by Oracle. See [MySQL Connector/Python Developer Guide](#) for details on the Connector, as well as coding guidelines for Python applications and sample Python code.

## 31.11 MySQL Ruby APIs

The [mysql2](#) Ruby gem provides an API for connecting to MySQL, performing queries, and iterating through results; it is intended to support MySQL 5.7 and MySQL 8.0. For more information, see the [mysql2 page at RubyGems.org](#) or the project's [GitHub page](#).

For background and syntax information about the Ruby language, see [Ruby Programming Language](#).

### 31.11.1 The MySQL/Ruby API

The MySQL/Ruby module provides access to MySQL databases using Ruby through [libmysqlclient](#).

For information on installing the module, and the functions exposed, see [MySQL/Ruby](#).

### 31.11.2 The Ruby/MySQL API

The Ruby/MySQL module provides access to MySQL databases using Ruby through a native driver interface using the MySQL network protocol.

For information on installing the module, and the functions exposed, see [Ruby/MySQL](#).

## 31.12 MySQL Tcl API

[MySQLtcl](#) is a simple API for accessing a MySQL database server from the [Tcl programming language](#). It can be found at <http://www.xdobry.de/mysqltcl/>.

## 31.13 MySQL Eiffel Wrapper

Eiffel MySQL is an interface to the MySQL database server using the [Eiffel programming language](#), written by Michael Ravits. It can be found at <http://efsa.sourceforge.net/archive/ravits/mysql.htm>.

# Chapter 32 MySQL Enterprise Edition

## Table of Contents

32.1 MySQL Enterprise Backup Overview .....	5057
32.2 MySQL Enterprise Security Overview .....	5058
32.3 MySQL Enterprise Encryption Overview .....	5058
32.4 MySQL Enterprise Audit Overview .....	5059
32.5 MySQL Enterprise Firewall Overview .....	5059
32.6 MySQL Enterprise Thread Pool Overview .....	5059
32.7 MySQL Enterprise Data Masking and De-Identification Overview .....	5059
32.8 MySQL Enterprise Monitor Overview .....	5060
32.9 MySQL Telemetry .....	5061

MySQL Enterprise Edition is a commercial product. Like MySQL Community Edition, MySQL Enterprise Edition includes MySQL Server, a fully integrated transaction-safe, ACID-compliant database with full commit, rollback, crash-recovery, and row-level locking capabilities. In addition, MySQL Enterprise Edition includes the following components designed to provide monitoring and online backup, as well as improved security and scalability:

The following sections briefly discuss each of these components and indicate where to find more detailed information. To learn more about commercial products, see <https://www.mysql.com/products/>.

- [MySQL Enterprise Backup](#)
- [MySQL Enterprise Security](#)
- [MySQL Enterprise Encryption](#)
- [MySQL Enterprise Audit](#)
- [MySQL Enterprise Firewall](#)
- [MySQL Enterprise Thread Pool](#)
- [MySQL Enterprise Data Masking and De-Identification](#)
- [MySQL Enterprise Monitor](#)

## 32.1 MySQL Enterprise Backup Overview

MySQL Enterprise Backup performs hot backup operations for MySQL databases. The product is architected for efficient and reliable backups of tables created by the InnoDB storage engine. For completeness, it can also back up tables from MyISAM and other storage engines.

The following discussion briefly summarizes MySQL Enterprise Backup. For more information, see the MySQL Enterprise Backup manual, available at <https://dev.mysql.com/doc/mysql-enterprise-backup/en/>.

Hot backups are performed while the database is running and applications are reading and writing to it. This type of backup does not block normal database operations, and it captures even changes that occur while the backup is happening. For these reasons, hot backups are desirable when your database “grows up” -- when the data is large enough that the backup takes significant time, and when your data is important enough to your business that you must capture every last change, without taking your application, website, or web service offline.

MySQL Enterprise Backup does a hot backup of all tables that use the InnoDB storage engine. For tables using MyISAM or other non-InnoDB storage engines, it does a “warm” backup, where the database continues to run, but those tables cannot be modified while being backed up. For efficient

backup operations, you can designate InnoDB as the default storage engine for new tables, or convert existing tables to use the InnoDB storage engine.

## 32.2 MySQL Enterprise Security Overview

MySQL Enterprise Edition provides plugins that implement security features using external services:

- MySQL Enterprise Edition includes an authentication plugin that enables MySQL Server to use LDAP (Lightweight Directory Access Protocol) to authenticate MySQL users. LDAP Authentication supports user name and password, SASL, and GSSAPI/Kerberos authentication methods to LDAP services. For more information, see [Section 8.4.1.7, “LDAP Pluggable Authentication”](#).
- MySQL Enterprise Edition includes an authentication plugin that enables MySQL Server to use Native Kerberos to authenticate MySQL users using their Kerberos Principals. For more information, see [Section 8.4.1.8, “Kerberos Pluggable Authentication”](#).
- MySQL Enterprise Edition includes an authentication plugin that enables MySQL Server to use PAM (Pluggable Authentication Modules) to authenticate MySQL users. PAM enables a system to use a standard interface to access various kinds of authentication methods, such as Unix passwords or an LDAP directory. For more information, see [Section 8.4.1.5, “PAM Pluggable Authentication”](#).
- MySQL Enterprise Edition includes an authentication plugin that performs external authentication on Windows, enabling MySQL Server to use native Windows services to authenticate client connections. Users who have logged in to Windows can connect from MySQL client programs to the server based on the information in their environment without specifying an additional password. For more information, see [Section 8.4.1.6, “Windows Pluggable Authentication”](#).
- MySQL Enterprise Edition includes a suite of masking and de-identification functions that perform subsetting, random generation, and dictionary replacement to de-identify strings, numerics, phone numbers, emails and more. These functions enable masking existing data using several methods such as obfuscation (removing identifying characteristics), generation of formatted random data, and data replacement or substitution. For more information, see [Section 8.5, “MySQL Enterprise Data Masking and De-Identification”](#).
- MySQL Enterprise Edition includes a set of encryption functions based on the OpenSSL library that expose OpenSSL capabilities at the SQL level. For more information, see [Section 32.3, “MySQL Enterprise Encryption Overview”](#).
- MySQL Enterprise Edition 5.7 and higher includes a keyring plugin that uses Oracle Key Vault as a backend for keyring storage. For more information, see [Section 8.4.4, “The MySQL Keyring”](#).
- MySQL Transparent Data Encryption (TDE) provides at-rest encryption for MySQL Server for all files that might contain sensitive data. For more information, see [Section 17.13, “InnoDB Data-at-Rest Encryption”](#), [Section 19.3.2, “Encrypting Binary Log Files and Relay Log Files”](#), and [Encrypting Audit Log Files](#).

For other related Enterprise security features, see [Section 32.3, “MySQL Enterprise Encryption Overview”](#).

## 32.3 MySQL Enterprise Encryption Overview

MySQL Enterprise Edition includes a set of encryption functions based on the OpenSSL library that expose OpenSSL capabilities at the SQL level. These functions enable Enterprise applications to perform the following operations:

- Implement added data protection using public-key asymmetric cryptography
- Create public and private keys and digital signatures
- Perform asymmetric encryption and decryption

- Use cryptographic hashing for digital signing and data verification and validation

For more information, see [Section 8.6, “MySQL Enterprise Encryption”](#).

For other related Enterprise security features, see [Section 32.2, “MySQL Enterprise Security Overview”](#).

## 32.4 MySQL Enterprise Audit Overview

MySQL Enterprise Edition includes MySQL Enterprise Audit, implemented using a server plugin. MySQL Enterprise Audit uses the open MySQL Audit API to enable standard, policy-based monitoring and logging of connection and query activity executed on specific MySQL servers. Designed to meet the Oracle audit specification, MySQL Enterprise Audit provides an out of box, easy to use auditing and compliance solution for applications that are governed by both internal and external regulatory guidelines.

When installed, the audit plugin enables MySQL Server to produce a log file containing an audit record of server activity. The log contents include when clients connect and disconnect, and what actions they perform while connected, such as which databases and tables they access.

For more information, see [Section 8.4.5, “MySQL Enterprise Audit”](#).

## 32.5 MySQL Enterprise Firewall Overview

MySQL Enterprise Edition includes MySQL Enterprise Firewall, an application-level firewall that enables database administrators to permit or deny SQL statement execution based on matching against allowlists of accepted statement patterns. This helps harden MySQL Server against attacks such as SQL injection or attempts to exploit applications by using them outside of their legitimate query workload characteristics.

Each MySQL account registered with the firewall has its own statement allowlist, enabling protection to be tailored per account. For a given account, the firewall can operate in recording or protecting mode, for training in the accepted statement patterns or protection against unacceptable statements.

For more information, see [Section 8.4.7, “MySQL Enterprise Firewall”](#).

## 32.6 MySQL Enterprise Thread Pool Overview

MySQL Enterprise Edition includes MySQL Enterprise Thread Pool, implemented using a server plugin. The default thread-handling model in MySQL Server executes statements using one thread per client connection. As more clients connect to the server and execute statements, overall performance degrades. In MySQL Enterprise Edition, a thread pool plugin provides an alternative thread-handling model designed to reduce overhead and improve performance. The plugin implements a thread pool that increases server performance by efficiently managing statement execution threads for large numbers of client connections.

For more information, see [Section 7.6.3, “MySQL Enterprise Thread Pool”](#).

## 32.7 MySQL Enterprise Data Masking and De-Identification Overview

MySQL Enterprise Edition 5.7 and higher includes MySQL Enterprise Data Masking and De-Identification, implemented as a plugin library containing a plugin and several loadable functions. Data masking hides sensitive information by replacing real values with substitutes. MySQL Enterprise Data Masking and De-Identification functions enable masking existing data using several methods such as obfuscation (removing identifying characteristics), generation of formatted random data, and data replacement or substitution.

For more information, see [Section 8.5, “MySQL Enterprise Data Masking and De-Identification”](#).

## 32.8 MySQL Enterprise Monitor Overview

For information about MySQL Enterprise Monitor behavior, see the MySQL Enterprise Monitor manual: <https://dev.mysql.com/doc/mysql-monitor/en/>.

### Important

MySQL Enterprise Monitor will be end of life and deprecated with obsolescence as of January 1, 2025.

After this date, MySQL Enterprise Monitor will no longer receive security updates, non-security updates, bug fixes, or online technical content updates. It will transition to the *Sustaining Support model*.

What to expect when MySQL Enterprise Monitor reaches the end of life (EOL):

- MySQL will cease all bug fix activities for the product
- MySQL will cease all security fix activities for the product
- MySQL will cease all new feature work for the product

Sustaining Support does not include:

- New program updates, fixes, security alerts, and critical patch updates
- New tax, legal, or regulatory updates
- New upgrade scripts
- Certification with new third-party products/versions
- 24 hour commitment and response guidelines for Severity 1 service requests as defined in "Section 9 - Severity Definitions" in the document titled "Oracle Software Technical Support Policies"
- Previously released fixes or updates that Oracle has withdrawn from publication. Older or existing published software bundles will remain available as archived content.

For the set of Oracle Technical Support Policies, visit: <https://www.oracle.com/support/policies.html>

For an explanation of the different support models (like Sustaining Support), visit: <https://www.oracle.com/support/lifetime-support/>

For customers that are currently using earlier versions of MySQL Enterprise Monitor, your options include:

- Use Enterprise Manager for MySQL. This is a free product for customers with a valid Oracle Support Contract. For more information, visit [Comprehensive Monitoring and Compliance Management for MySQL Databases using Enterprise Manager](#).
- Use the database monitoring capabilities of the OCI Database Management service. For MySQL on-premises customers, this is a paid feature that will be released soon. For more information, visit [Database Management for MySQL HeatWave](#).

## Affected deployments

- MySQL Enterprise Monitor Service Manager for Linux x86 (64-bit)
- MySQL Enterprise Monitor Agent for Linux x86 (64-bit)

- MySQL Enterprise Monitor Service Manager for Windows x86 (64-bit)
- MySQL Enterprise Monitor Agent for Microsoft Windows x86 (64-bit)
- MySQL Enterprise Monitor Service Manager for Mac OS X x86 (64-bit)
- MySQL Enterprise Monitor Agent for Mac OS X x86 (64-bit)

## 32.9 MySQL Telemetry

The MySQL telemetry component is based on the OpenTelemetry (OTel) project, an open-source, vendor-neutral observability framework providing a common observability standard. It enables users to instrument their applications in order to export observability data: traces, metrics and logs, enabling increased granularity of debugging and testing.

For more information, see [Chapter 35, \*Telemetry\*](#).

---

# Chapter 33 MySQL Workbench

MySQL Workbench provides a graphical tool for working with MySQL servers and databases. MySQL Workbench is developed and tested with MySQL Server 8.0. MySQL Workbench may connect to MySQL Server 8.4 and higher but some MySQL Workbench features may not function with those newer server versions.

The following discussion briefly describes MySQL Workbench capabilities. For more information, see the MySQL Workbench manual, available at <https://dev.mysql.com/doc/workbench/en/>.

MySQL Workbench provides five main areas of functionality:

- **SQL Development:** Enables you to create and manage connections to database servers. As well as enabling you to configure connection parameters, MySQL Workbench provides the capability to execute SQL queries on the database connections using the built-in SQL Editor. This functionality replaces that previously provided by the Query Browser standalone application.
- **Data Modeling:** Enables you to create models of your database schema graphically, reverse and forward engineer between a schema and a live database, and edit all aspects of your database using the comprehensive Table Editor. The Table Editor provides easy-to-use facilities for editing Tables, Columns, Indexes, Triggers, Partitioning, Options, Inserts and Privileges, Routines and Views.
- **Server Administration:** Enables you to create and administer server instances.
- **Data Migration:** Allows you to migrate from Microsoft SQL Server, Sybase ASE, SQLite, SQL Anywhere, PostgreSQL, and other RDBMS tables, objects and data to MySQL. Migration also supports migrating from earlier versions of MySQL to the latest releases.
- **MySQL Enterprise Support:** Support for Enterprise products such as MySQL Enterprise Backup and MySQL Audit.

MySQL Workbench is available in two editions, the Community Edition and the Commercial Edition. The Community Edition is available free of charge. The Commercial Edition provides additional Enterprise features, such as database documentation generation, at low cost.

---

# Chapter 34 MySQL on OCI Marketplace

## Table of Contents

34.1 Prerequisites to Deploying MySQL EE on Oracle Cloud Infrastructure .....	5065
34.2 Deploying MySQL EE on Oracle Cloud Infrastructure .....	5065
34.3 Configuring Network Access .....	5067
34.4 Connecting .....	5067
34.5 Maintenance .....	5068

This chapter describes how to deploy MySQL Enterprise Edition as an Oracle Cloud Infrastructure (OCI) Marketplace Application. This is a BYOL product.

### Note

For more information on OCI marketplace, see [Overview of Marketplace](#).

The MySQL Enterprise Edition Marketplace Application is an OCI compute instance, running Oracle Linux 9.3, with MySQL EE 8.4. The MySQL EE installation on the deployed image is similar to the RPM installation, as described in [Section 2.5.4, “Installing MySQL on Linux Using RPM Packages from Oracle”](#).

For more information on MySQL Enterprise Edition, see [Chapter 32, MySQL Enterprise Edition](#).

For more information on MySQL advanced configuration, see [Secure Deployment Guide](#).

For more information on Oracle Linux 9, see [Oracle Linux Documentation](#)

This product is user-managed, meaning you are responsible for upgrades and maintenance.

## 34.1 Prerequisites to Deploying MySQL EE on Oracle Cloud Infrastructure

The following assumptions are made:

- You are familiar with OCI terminology. If you are new to OCI, see [Getting Started](#).
- You have access to a properly configured Virtual Cloud Network (VCN) and subnet. For more information, see [Virtual Networking](#).
- You have the permissions required to deploy OCI Marketplace applications in a compartment of your tenancy. For more information, see [How Policies Work](#).

## 34.2 Deploying MySQL EE on Oracle Cloud Infrastructure

To deploy MySQL EE on Oracle Cloud Infrastructure, do the following:

1. Open the OCI Marketplace and search for **MySQL**.

The **MySQL** listings are displayed.

2. Select **MySQL Enterprise Edition**.

The **MySQL Enterprise Edition** overview is displayed.

3. Click **Launch Instance** to begin the application launch process.

The **Create Compute Instance** dialog is displayed.

See [To create a Linux instance](#) for information on how to complete the fields.

By default, the MySQL server listens on port 3306 and is configured with a single user, root.

### Important

When the deployment is complete, and the MySQL server is started, you must connect to the compute instance and retrieve the default root password which was written to the MySQL log file.

See [Connecting with SSH](#) for more information.

The following MySQL software is installed:

- MySQL Server EE
- MySQL Enterprise Backup
- MySQL Shell
- MySQL Router

## MySQL Configuration

For security, the following are enabled:

- SELinux: for more information, see [Configuring and Using SELinux](#)
- `firewalld`: for more information, see [Controlling the firewalld Firewall Service](#)

The following MySQL plugins are enabled:

- `thread_pool`
- `validate_password`

On startup, the following occurs:

- MySQL Server reads `/etc/my.cnf` and all files named `*.cnf` in `/etc/my.cnf.d/`.
- `/etc/my.cnf.d/perf-tuning.cnf` is created by `/usr/bin/mkcnf` based on the selected OCI shape.

### Note

To disable this mechanism, remove `/etc/systemd/system/mysqld.service.d/perf-tuning.conf`.

Performance tuning is configured for the following shapes:

- VM.Standard2.1
- VM.Standard2.2
- VM.Standard2.4
- VM.Standard2.8
- VM.Standard2.16

- VM.Standard2.24
- VM.Standard.E2.1
- VM.Standard.E2.2
- VM.Standard.E2.4
- VM.Standard.E2.8
- VM.Standard.E3.Flex
- VM.Standard.E4.Flex
- BM.Standard2.52

**Important**

For all other shapes, the tuning for VM.Standard2.1 is used.

## 34.3 Configuring Network Access

For information on OCI Security Rules, see [Security Rules](#).

**Important**

You must enable ingress on the following ports:

- 22: SSH
- 3306: MySQL
- 33060: (optional) MySQL X Protocol. Used by MySQL Shell.

## 34.4 Connecting

This section describes the various connection methods for connecting to the deployed MySQL server on the OCI Compute Instance.

### Connecting with SSH

This section gives some detail on connecting from a UNIX-like platform to the OCI Compute. For more information on connecting with SSH, see [Accessing an Oracle Linux Instance Using SSH](#) and [Connecting to Your Instance](#).

To connect to the Oracle Linux running on the Compute Instance with SSH, run the following command:

```
ssh opc@computeIP
```

where `opc` is the compute user and `computeIP` is the IP address of your Compute Instance.

To find the temporary root password created for the root user, run the following command:

```
sudo grep 'temporary password' /var/log/mysqld.log
```

To change your default password, log in to the server using the generated, temporary password, using the following command: `mysql -uroot -p`. Then run the following:

```
ALTER USER 'root'@'localhost' IDENTIFIED BY 'MyNewPass4!';
```

## Connecting with MySQL Client

### Note

To connect from your local MySQL client, you must first create on the MySQL server a user which allows remote login.

To connect to the MySQL Server from your local MySQL client, run the following command from your shell session:

```
mysql -uroot -p -hcomputeIP
```

where `computeIP` is the IP address of your Compute Instance.

## Connecting with MySQL Shell

To connect to the MySQL Server from your local MySQL Shell, run the following command to start your shell session:

```
mysqlsh root@computeIP
```

where `computeIP` is the IP address of your Compute Instance.

For more information on MySQL Shell connections, see [MySQL Shell Connections](#).

## Connecting with Workbench

To connect to the MySQL Server from MySQL Workbench, see [Connections in MySQL Workbench](#).

## 34.5 Maintenance

This product is user-managed, meaning you are responsible for upgrades and maintenance.

### Upgrading MySQL

The existing installation is RPM-based, to upgrade the MySQL server, see [Section 3.7, “Upgrading MySQL Binary or Package-based Installations on Unix/Linux”](#).

You can use `scp` to copy the required RPM to the OCI Compute Instance, or copy it from OCI Object Storage, if you have configured access to it. File Storage is also an option. For more information, see [File Storage and NFS](#).

### Backup and Restore

MySQL Enterprise Backup is the preferred backup and restore solution. For more information, see [Backing Up to Cloud Storage](#).

For information on MySQL Enterprise Backup, see [Getting Started with MySQL Enterprise Backup](#).

For information on the default MySQL backup and restore, see [Chapter 9, \*Backup and Recovery\*](#).

# Chapter 35 Telemetry

## Table of Contents

35.1 Installing OpenTelemetry Support .....	5069
35.2 Telemetry Variables .....	5070
35.3 OpenTelemetry Trace .....	5071
35.3.1 Configuring Trace Telemetry .....	5071
35.3.2 Trace Format .....	5080
35.4 OpenTelemetry Metrics .....	5082
35.4.1 Configuring Metrics Telemetry .....	5082
35.4.2 Server Meters .....	5087
35.4.3 Server Metrics .....	5087

The OpenTelemetry (OTel) project is an open-source, vendor-neutral observability framework, providing a common observability standard. It enables users to instrument their applications in order to export observability data: traces, metrics and logs, enabling increased granularity of debugging and testing.

### Note

OpenTelemetry support is a component included in MySQL Enterprise Edition, a commercial product. To learn more about commercial products, see <https://www.mysql.com/products/>.

This chapter assumes familiarity with the [OpenTelemetry Documentation](#).

## 35.1 Installing OpenTelemetry Support

This section describes the installation of the server and client OpenTelemetry support.

- [Installing Server Component](#)
- [Installing Client Plugin](#)

### Installing Server Component

To install the server component, run the following command:

```
install component 'file:///component_telemetry';
```

To confirm the component is present in your server, run the following query:

```
mysql> select * from mysql.component;
+-----+-----+-----+
| component_id | component_group_id | component_urn |
+-----+-----+-----+
| 1 | 1 | file:///component_validate_password |
| 2 | 2 | file:///component_telemetry |
+-----+-----+-----+
```

If `component_telemetry` is present in the `component_urn` column, the component is installed.

The component installation also adds telemetry-specific system variables.

```
mysql> show variables like "%telemetry%";
+-----+-----+
| Variable_name | Value |
+-----+-----+
| telemetry.metrics_enabled | ON |
| telemetry.metrics_reader_frequency_1 | 10 |
+-----+-----+
```

telemetry.metrics_reader_frequency_2	60
telemetry.metrics_reader_frequency_3	0
telemetry.otel_bsp_max_export_batch_size	512
telemetry.otel_bsp_max_queue_size	2048
telemetry.otel_bsp_schedule_delay	5000
telemetry.otel_exporter_otlp_metrics_certificates	
telemetry.otel_exporter_otlp_metrics_cipher	
telemetry.otel_exporter_otlp_metrics_cipher_suite	
telemetry.otel_exporter_otlp_metrics_client_certificates	
telemetry.otel_exporter_otlp_metrics_client_key	
telemetry.otel_exporter_otlp_metrics_compression	none
telemetry.otel_exporter_otlp_metrics_endpoint	http://localhost:4318/v1/metrics
telemetry.otel_exporter_otlp_metrics_headers	
telemetry.otel_exporter_otlp_metrics_max_tls	
telemetry.otel_exporter_otlp_metrics_min_tls	
telemetry.otel_exporter_otlp_metrics_protocol	
telemetry.otel_exporter_otlp_metrics_timeout	
telemetry.otel_exporter_otlp_traces_certificates	http/protobuf
telemetry.otel_exporter_otlp_traces_cipher	10000
telemetry.otel_exporter_otlp_traces_cipher_suite	
telemetry.otel_exporter_otlp_traces_client_certificates	
telemetry.otel_exporter_otlp_traces_client_key	
telemetry.otel_exporter_otlp_traces_compression	none
telemetry.otel_exporter_otlp_traces_endpoint	http://localhost:4318/v1/traces
telemetry.otel_exporter_otlp_traces_headers	
telemetry.otel_exporter_otlp_traces_max_tls	
telemetry.otel_exporter_otlp_traces_min_tls	
telemetry.otel_exporter_otlp_traces_protocol	
telemetry.otel_exporter_otlp_traces_timeout	
telemetry.otel_log_level	info
telemetry.otel_resource_attributes	
telemetry.query_text_enabled	ON
telemetry.trace_enabled	ON

See [Server Configuration](#).

## Installing Client Plugin

The Telemetry plugin for the MySQL client can be enabled with a command line switch, `--telemetry_client` or from a configuration option, `telemetry-client=ON | OFF`, defined in the `[mysql]` section of the configuration file.

## 35.2 Telemetry Variables

The following table lists the Telemetry variables.

**Table 35.1 Telemetry Variable Summary**

Name	Cmd-Line	Option File	System Var	Status Var	Var Scope	Dynamic
telemetry.live_sessions				Yes	Global	No
telemetry.metrics_reader_frequency_1	Yes				Global	No
telemetry.metrics_reader_frequency_2	Yes				Global	No
telemetry.metrics_reader_frequency_3	Yes				Global	No
telemetry.otel_bsp_max_export_batch_size	Yes				Global	No
telemetry.otel_bsp_max_queue_size	Yes				Global	No
telemetry.otel_bsp_schedule_delay	Yes				Global	No
telemetry.otel_exporter_otlp_metrics_certificates	Yes				Global	No
telemetry.otel_exporter_otlp_metrics_cipher	Yes				Global	No
telemetry.otel_exporter_otlp_metrics_cipher_suite	Yes				Global	No
telemetry.otel_exporter_otlp_metrics_client_certificates	Yes				Global	No

Name	Cmd-Line	Option File	System Var	Status Var	Var Scope	Dynamic
telemetry.otel_exporter_otlp_metrics_client	Yes				Global	No
telemetry.otel_exporter_otlp_metrics_compression	Yes				Global	No
telemetry.otel_exporter_otlp_metrics_endpoints	Yes				Global	No
telemetry.otel_exporter_otlp_metrics_headers	Yes				Global	No
telemetry.otel_exporter_otlp_metrics_max_tls	Yes				Global	No
telemetry.otel_exporter_otlp_metrics_min_tls	Yes				Global	No
telemetry.otel_exporter_otlp_metrics_protocols	Yes				Global	No
telemetry.otel_exporter_otlp_metrics_timeout	Yes				Global	No
telemetry.otel_exporter_otlp_traces_certificates	Yes				Global	No
telemetry.otel_exporter_otlp_traces_cipher	Yes				Global	No
telemetry.otel_exporter_otlp_traces_ciphers	Yes				Global	No
telemetry.otel_exporter_otlp_traces_client_certificates	Yes				Global	No
telemetry.otel_exporter_otlp_traces_client_keys	Yes				Global	No
telemetry.otel_exporter_otlp_traces_compress	Yes				Global	No
telemetry.otel_exporter_otlp_traces_endpoint	Yes				Global	No
telemetry.otel_exporter_otlp_traces_headers	Yes				Global	No
telemetry.otel_exporter_otlp_traces_max_tls	Yes				Global	No
telemetry.otel_exporter_otlp_traces_min_tls	Yes				Global	No
telemetry.otel_exporter_otlp_traces_protocol	Yes				Global	No
telemetry.otel_exporter_otlp_traces_timeout	Yes				Global	No
telemetry.otel_log_level		Yes			Global	Yes
telemetry.otel_resource_attributes		Yes			Global	No
telemetry.query_text_enabled		Yes			Global	Yes
telemetry.trace_enabled		Yes			Global	Yes

## 35.3 OpenTelemetry Trace

Tracing telemetry enables you to visualize the flow of any processing action as it is processed through your server. The data for each action, a span, includes possible error information and timing data. Traces are generated for [COM\\_QUERY](#) commands executed, including non-query commands such as [COM\\_PING](#), or [COM\\_STMT\\_CLOSE](#). Query statement traces also have an associated SQL text attribute.

Telemetry tracing is implemented in:

- MySQL Enterprise Edition Telemetry Component
- MySQL Enterprise Edition Client
- MySQL Connectors

### 35.3.1 Configuring Trace Telemetry

This section describes the configuration for server and client.

- [Server Configuration](#)
- [Client Configuration](#)
- [Client Configuration Example](#)

## Server Configuration

The following are the server trace telemetry configuration variables:

- `telemetry.trace_enabled`

System Variable	<code>telemetry.trace_enabled</code>
Scope	Global
Dynamic	Yes
<code>SET_VAR</code> Hint Applies	No
Type	Boolean
Default Value	<code>ON</code>

Controls whether telemetry traces are collected or not .

- `telemetry.query_text_enabled`

System Variable	<code>telemetry.query_text_enabled</code>
Scope	Global
Dynamic	Yes
<code>SET_VAR</code> Hint Applies	No
Type	Boolean
Default Value	<code>ON</code>

Controls whether the SQL query text is included in the trace

- `telemetry.otel_log_level`

System Variable	<code>telemetry.otel_log_level</code>
Scope	Global
Dynamic	Yes
<code>SET_VAR</code> Hint Applies	No
Type	Enumeration
Default Value	<code>ERROR</code>
Valid Values	<code>SILENT</code> <code>INFO</code> <code>ERROR</code> <code>WARNING</code> <code>DEBUG</code>

Controls which OpenTelemetry logs are printed in the server logs

- `telemetry.otel_resource_attributes`

System Variable	<code>telemetry.otel_resource_attributes</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No

Type	String
Default Value	empty

See corresponding OpenTelemetry variable OTEL\_RESOURCE\_ATTRIBUTES.

- `telemetry.otel_exporter_otlp_traces_protocol`

System Variable	<code>telemetry.otel_exporter_otlp_traces_protocol</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Enumeration
Default Value	<code>http/protobuf</code>
Valid Values	<code>http/protobuf</code> <code>http/json</code>

OTLP transport protocol

- `telemetry.otel_exporter_otlp_traces_endpoint`

System Variable	<code>telemetry.otel_exporter_otlp_traces_endpoint</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	String
Default Value	<code>http://localhost:4318/v1/traces</code>

Target URL to which the exporter sends traces

- `telemetry.otel_exporter_otlp_traces_certificates`

System Variable	<code>telemetry.otel_exporter_otlp_traces_certificates</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	String
Default Value	

The trusted certificate to use when verifying a server's TLS credentials.

- `telemetry.otel_exporter_otlp_traces_client_key`

System Variable	<code>telemetry.otel_exporter_otlp_traces_client_key</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	String
Default Value	

Client's private key in PEM format.

- `telemetry.otel_exporter_otlp_traces_client_certificates`

System Variable	<code>telemetry.otel_exporter_otlp_traces_client_certificates</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	String
Default Value	

Client certificate/chain trust for clients private key in PEM format.

- `telemetry.otel_exporter_otlp_traces_headers`

System Variable	<code>telemetry.otel_exporter_otlp_traces_headers</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	String
Default Value	<code>empty</code>

See corresponding OpenTelemetry variable OTEL\_EXPORTER\_TRACES\_HEADERS.

- `telemetry.otel_exporter_otlp_traces_compression`

System Variable	<code>telemetry.otel_exporter_otlp_traces_compression</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	String
Default Value	<code>none (no compression)</code>
Valid Values	<code>none (no compression)</code> <code>gzip</code>

Compression used by exporter

- `telemetry.otel_exporter_otlp_traces_timeout`

System Variable	<code>telemetry.otel_exporter_otlp_traces_timeout</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	<code>10000</code>
Unit	milliseconds

Time in milliseconds the OLTP exporter waits for each batch export.

- `telemetry.otel_bsp_schedule_delay`

System Variable	<code>telemetry.otel_bsp_schedule_delay</code>
-----------------	------------------------------------------------

Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	5000
Unit	milliseconds

Delay interval between two consecutive exports in milliseconds

- `telemetry.otel_bsp_max_queue_size`

System Variable	<code>telemetry.otel_bsp_max_queue_size</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	2048

Maximum queue size

- `telemetry.otel_bsp_max_export_batch_size`

System Variable	<code>telemetry.otel_bsp_max_export_batch_size</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	512

Maximum batch size

- `telemetry.otel_exporter_otlp_traces_min_tls`

System Variable	<code>telemetry.otel_exporter_otlp_traces_min_tls</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Enumeration
Default Value	[none]
Valid Values	[none] 1.2 1.3

- `telemetry.otel_exporter_otlp_traces_max_tls`

System Variable	<code>telemetry.otel_exporter_otlp_traces_max_tls</code>
Scope	Global

Dynamic	No
<a href="#">SET_VAR Hint Applies</a>	No
Type	Enumeration
Default Value	[none]
Valid Values	[none] 1.2 1.3

- `telemetry.otel_exporter_otlp_traces_cipher`

System Variable	<a href="#">telemetry.otel_exporter_otlp_traces_cipher</a>
Scope	Global
Dynamic	No
<a href="#">SET_VAR Hint Applies</a>	No
Type	String
Default Value	[none]

- `telemetry.otel_exporter_otlp_traces_cipher_suite`

System Variable	<a href="#">telemetry.otel_exporter_otlp_traces_cipher_suite</a>
Scope	Global
Dynamic	No
<a href="#">SET_VAR Hint Applies</a>	No
Type	String
Default Value	[none]

## Client Configuration

The MySQL client reads telemetry configuration from the `[telemetry_client]` section of the configuration file. See [Installing Client Plugin](#) for information on the `telemetry_client` option. The following configuration options are available:

**Table 35.2 mysql client Telemetry Option Summary**

Option Name	Description
<code>--telemetry_client</code>	Enables the telemetry client.
<code>--otel_bsp_max_export_batch_size</code>	See variable OTEL_BSP_MAX_EXPORT_BATCH_SIZE.
<code>--otel_bsp_max_queue_size</code>	See variable OTEL_BSP_MAX_QUEUE_SIZE.
<code>--otel_bsp_schedule_delay</code>	See variable OTEL_BSP_SCHEDULE_DELAY.
<code>--otel_exporter_otlp_traces_certificates</code>	Not in use at this time. Reserved for future development.
<code>--otel_exporter_otlp_traces_client_certificates</code>	Not in use at this time. Reserved for future development.
<code>--otel_exporter_otlp_traces_client_key</code>	Not in use at this time. Reserved for future development.

Option Name	Description
--otel_exporter_otlp_traces_compression	Compression type
--otel_exporter_otlp_traces_endpoint	The trace export endpoint
--otel_exporter_otlp_traces_headers	Key-value pairs to be used as headers associated with HTTP requests
--otel_exporter_otlp_traces_protocol	The OTLP transport protocol
--otel_exporter_otlp_traces_timeout	Time OLTP exporter waits for each batch export
--otel-help	When enabled, prints help about telemetry_client options.
--otel_log_level	Controls which opentelemetry logs are printed in the server logs
--otel_resource_attributes	See corresponding OpenTelemetry variable OTEL_RESOURCE_ATTRIBUTES.
--otel-trace	This system variable controls whether telemetry traces are collected or not.

- [trace](#)

Command-Line Format	--otel-trace
Type	Boolean
Default Value	ON

Controls whether telemetry traces are collected or not .

- [help](#)

Command-Line Format	--otel-help
Type	Boolean
Default Value	OFF

When enabled, prints help about telemetry\_client options .

- [otel\\_log\\_level](#)

Command-Line Format	--otel_log_level
Type	Enumeration
Default Value	ERROR
Valid Values	ERROR SILENT WARNING INFO DEBUG

Controls which OpenTelemetry logs are printed in the server logs

- [otel\\_resource\\_attributes](#)

Command-Line Format	--otel_resource_attributes
Type	String

Default Value	
---------------	--

See corresponding OpenTelemetry variable OTEL\_RESOURCE\_ATTRIBUTES.

- `otel_exporter_otlp_traces_protocol`

Command-Line Format	--otel_exporter_otlp_traces_protocol
Type	Enumeration
Default Value	<code>http/protobuf</code>
Valid Values	<code>http/protobuf</code> <code>http/json</code>

OTLP transport protocol

- `otel_exporter_otlp_traces_endpoint`

Command-Line Format	--otel_exporter_otlp_traces_endpoint
Type	String
Default Value	<code>http://localhost:4318/v1/traces</code>

Target URL to which the exporter sends traces

- `otel_exporter_otlp_traces_certificates`

Command-Line Format	-- otel_exporter_otlp_traces_certificates
Type	String
Default Value	

The trusted certificate to use when verifying a server's TLS credentials.

- `otel_exporter_otlp_traces_client_key`

Command-Line Format	-- otel_exporter_otlp_traces_client_key
Type	String
Default Value	

Client's private key in PEM format.

- `otel_exporter_otlp_traces_client_certificates`

Command-Line Format	-- otel_exporter_otlp_traces_client_certificates
Type	String
Default Value	

Client certificate/chain trust for clients private key in PEM format.

- `otel_exporter_otlp_traces_headers`

Command-Line Format	--otel_exporter_otlp_traces_headers
Type	String

Default Value	
---------------	--

See corresponding OpenTelemetry variable OTEL\_EXPORTER\_TRACES\_HEADERS.

- `otel_exporter_otlp_traces_compression`

Command-Line Format	-- otel_exporter_otlp_traces_compression
Type	String
Default Value	<code>none</code>
Valid Values	<code>none</code> <code>gzip</code>

Compression used by exporter

- `otel_exporter_otlp_traces_timeout`

Command-Line Format	-- <code>otel_exporter_otlp_traces_timeout</code>
Type	Integer
Default Value	<code>10000</code>

Time OLTP exporter waits for each batch export

- `otel_bsp_schedule_delay`

Command-Line Format	-- <code>otel_bsp_schedule_delay</code>
Type	Integer
Default Value	<code>5000</code>

Delay interval between two consecutive exports in milliseconds

- `otel_bsp_max_queue_size`

Command-Line Format	-- <code>otel_bsp_max_queue_size</code>
Type	Integer
Default Value	<code>2048</code>

Maximum queue size

- `otel_bsp_max_export_batch_size`

Command-Line Format	-- <code>otel_bsp_max_export_batch_size</code>
Type	Integer
Default Value	<code>512</code>

Maximum batch size

## Client Configuration Example

The following is an example of a `my.cnf` configuration file containing the Client Telemetry plugin configuration:

```
[mysql]
telemetry-client = ON
```

```
[telemetry_client]
help = ON
trace = OFF
otel-resource-attributes = "RK1=RV1, RK2=RV2, RK3=RV3"
otel-log-level = "error"
otel-exporter-otlp-traces-headers = "K1=V1, K2=V2"
otel-exporter-otlp-traces-protocol = "http/json"
```

If `telemetry-client = ON` is set in the configuration file, you do not need to specify `--telemetry-client` when starting the client.

### 35.3.2 Trace Format

A span represents an operation within a trace. For more information, see [OpenTelemetry Span](#). The following span types are emitted by the telemetry component:

- [Control Span](#)
- [Session Span](#)
- [Statement Span](#)

#### Control Span

Issued when the telemetry configuration changes, notifying downstream system of which signal collection has been enabled or disabled.

This span type has the following attributes:

- `Name: Control`
- `trace_enabled: Boolean`.
- `metrics_enabled: Boolean`.
- `logs_enabled: Boolean`
- `details:`

#### Session Span

Issued when a client session ends, recording data relevant to that session from initial connection to close of session.

This span type has the following attributes:

- `Name: Session`
- `mysql.processlist_id`
- `mysql.thread_id`
- `mysql.user`
- `mysql.host`
- `mysql.group`

This span also contains dynamic attributes generated with the format `mysql.session_attr.xxx`, where `xxx` is the session connect attribute name. See [session\\_connect\\_attrs](#).

For example, after the following session disconnects:

```
mysql> select * from session_connect_attrs;
+-----+-----+-----+-----+
```

PROCESSLIST_ID	ATTR_NAME	ATTR_VALUE	ORDINAL_POSITION
10	_pid	14488	0
10	_platform	x86_64	1
10	_os	Linux	2
10	_client_name	libmysql	3
10	os_user	malff	4
10	_client_version	8.4.0-tr	5
10	program_name	mysql	6

7 rows in set (0.00 sec)

The session span emitted is:

```
Span #
 Trace ID : 4137db42febad2d00a4123286076ba18
 Parent ID :
 ID : b7ff26660b9fc35
 Name : session
 Kind : Internal
 Start time : 2023-01-11 10:58:24.79557649 +0000 UTC
 End time : 2023-01-11 11:00:50.46695685 +0000 UTC
 Status code : Unset
 Status message :

Attributes:
 -> mysql.processlist_id: Int(10)
 -> mysql.thread_id: Int(50)
 -> mysql.user: Str(root)
 -> mysql.host: Str(localhost)
 -> mysql.group: Str(USR_default)
 -> mysql.session_attr._pid: Str(14488)
 -> mysql.session_attr._platform: Str(x86_64)
 -> mysql.session_attr._os: Str(Linux)
 -> mysql.session_attr._client_name: Str(libmysql)
 -> mysql.session_attr.os_user: Str(malff)
 -> mysql.session_attr._client_version: Str(8.4.0-tr)
 -> mysql.session_attr.program_name: Str(mysql)
```

## Statement Span

Issued when a statement execution ends in the server, recording all relevant statement information from the start of the execution to its completion.

This span type has the following attributes:

- `Name: stmt`
- `mysql.event_name`
- `mysql.lock_time`
- `mysql.sql_text`
- `mysql.digest_text`
- `mysql.current_schema`
- `mysql.object_type`
- `mysql.object_schema`
- `mysql.object_name`
- `mysql.sql_errno`
- `mysql.sqlstate`

- `mysql.message_text`
- `mysql.error_count`
- `mysql.warning_count`
- `mysql.rows_affected`
- `mysql.rows_sent`
- `mysql.rows_examined`
- `mysql.created_tmp_disk_tables`
- `mysql.created_tmp_tables`
- `mysql.select_full_join`
- `mysql.select_full_range_join`
- `mysql.select_range`
- `mysql.select_range_check`
- `mysql.select_scan`
- `mysql.sort_merge_passes`
- `mysql.sort_range`
- `mysql.sort_rows`
- `mysql.sort_scan`
- `mysql.no_index_used`
- `mysql.no_good_index_used`
- `mysql.max_controlled_memory`
- `mysql.max_total_memory`
- `mysql.cpu_time`

## 35.4 OpenTelemetry Metrics

The Server Telemetry Metrics Service and the Server Metrics Instrument Service enable you to register and query telemetry meters, metrics, and metric measurements, in order to periodically export these measurements using the OpenTelemetry protocol.

For more information on these services, see Server Telemetry Metrics Service and the Server Metrics Instrument Service documentation in the MySQL Server Doxygen Documentation.

### 35.4.1 Configuring Metrics Telemetry

#### Server Configuration

- `telemetry.otel_exporter_otlp_metrics_protocol`

System Variable	<code>telemetry.otel_exporter_otlp_metrics_protocol</code>
Scope	Global
Dynamic	No

<code>SET_VAR</code> Hint Applies	No
Type	Enumeration
Default Value	<code>http/protobuf</code>
Valid Values	<code>http/protobuf</code> <code>http/json</code>

The OLTP transport protocol.

**Note**

MySQL does not support the `gprc` protocol.

- `telemetry.otel_exporter_otlp_metrics_endpoint`

System Variable	<code>telemetry.otel_exporter_otlp_metrics_endpoint</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	String
Default Value	<code>http://localhost:4318/v1/metrics</code>

Endpoint metric signals are sent to.

- `telemetry.otel_exporter_otlp_metrics_certificates`

System Variable	<code>telemetry.otel_exporter_otlp_metrics_certificates</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	String
Default Value	<code>[none]</code>

The trusted certificate to use when verifying a server's TLS credentials.

- `telemetry.otel_exporter_otlp_metrics_client_key`

System Variable	<code>telemetry.otel_exporter_otlp_metrics_client_key</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	String
Default Value	<code>[none]</code>

Client's private key in PEM format.

- `telemetry.otel_exporter_otlp_metrics_client_certificates`

System Variable	<code>telemetry.otel_exporter_otlp_metrics_client_certificates</code>
Scope	Global
Dynamic	No

<code>SET_VAR</code> Hint Applies	No
Type	String
Default Value	[none]

Client certificate/chain trust for clients private key in PEM format.

- `telemetry.otel_exporter_otlp_metrics_min_tls`

System Variable	<code>telemetry.otel_exporter_otlp_metrics_min_tls</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Enumeration
Default Value	[none]
Valid Values	<p>[none]</p> <p>1.2</p> <p>1.3</p>

Minimum TLS version to use for metrics.

- `telemetry.otel_exporter_otlp_metrics_max_tls`

System Variable	<code>telemetry.otel_exporter_otlp_metrics_max_tls</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Enumeration
Default Value	[none]
Valid Values	<p>[none]</p> <p>1.2</p> <p>1.3</p>

Maximum TLS version to use for metrics.

- `telemetry.otel_exporter_otlp_metrics_cipher`

System Variable	<code>telemetry.otel_exporter_otlp_metrics_cipher</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	String
Default Value	[none]

TLS cipher to use for metrics (TLS 1.2).

- `telemetry.otel_exporter_otlp_metrics_cipher_suite`

System Variable	<code>telemetry.otel_exporter_otlp_metrics_cipher_suite</code>
-----------------	----------------------------------------------------------------

Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	String
Default Value	[none]

TLS cipher to use for metrics (TLS 1.3).

- `telemetry.otel_exporter_otlp_metrics_headers`

System Variable	<code>telemetry.otel_exporter_otlp_metrics_headers</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	String
Default Value	[none]

Key-value pairs to be used as headers associated with HTTP requests.

- `telemetry.otel_exporter_otlp_metrics_compression`

System Variable	<code>telemetry.otel_exporter_otlp_metrics_compression</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	String
Default Value	<code>none (no compression)</code>
Valid Values	<code>none (no compression)</code> <code>gzip</code>

Compression used by exporter

- `telemetry.otel_exporter_otlp_metrics_timeout`

System Variable	<code>telemetry.otel_exporter_otlp_metrics_timeout</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	<code>10000</code>
Unit	milliseconds

Time in milliseconds the OLTP exporter waits for each batch export.

- `telemetry.metrics_reader_frequency_1`

System Variable	<code>telemetry.metrics_reader_frequency_1</code>
Scope	Global
Dynamic	No

<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	10
Unit	seconds

Mandatory. Defines the interval in seconds (f1) between meter evaluations for meters with a frequency less than or equal to the interval, f1. For example:

```
SELECT * from performance_schema.setup_meters WHERE FREQUENCY <= telemetry.metrics_reader_frequency_1
```

- `telemetry.metrics_reader_frequency_2`

System Variable	<code>telemetry.metrics_reader_frequency_2</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	10
Unit	seconds

Optional. Defines the interval in seconds (f2) between meter evaluations for meters with a frequency greater than the interval, f1. For example, if f1 and f2 are defined:

```
SELECT * from performance_schema.setup_meters WHERE FREQUENCY <= telemetry.metrics_reader_frequency_1
```

and, every f2 seconds:

```
SELECT * from performance_schema.setup_meters
WHERE FREQUENCY > telemetry.metrics_reader_frequency_1
AND FREQUENCY <= metrics_reader_frequency_2;
```

- `telemetry.metrics_reader_frequency_3`

System Variable	<code>telemetry.metrics_reader_frequency_3</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	10
Unit	seconds

Optional. Defines the interval in seconds (f3) between meter evaluations for meters with a frequency greater than the interval, f2. For example, if f1, f2, and f3 are defined:

```
SELECT * from performance_schema.setup_meters WHERE FREQUENCY <= telemetry.metrics_reader_frequency_1
```

and, every f2 seconds:

```
SELECT * from performance_schema.setup_meters
WHERE FREQUENCY > telemetry.metrics_reader_frequency_1
AND FREQUENCY <= metrics_reader_frequency_2;
```

and, every f3 seconds:

```
SELECT * from performance_schema.setup_meters WHERE FREQUENCY > telemetry.metrics_reader_frequency_2;
```

### 35.4.2 Server Meters

The server metrics are organised in groups, called Meters.

NAME	FREQUENCY	ENABLED	DESCRIPTION
mysql.inno	10	YES	MySQL InnoDB metrics
mysql.inno.buffer_pool	10	YES	MySQL InnoDB buffer pool metrics
mysql.inno.data	10	YES	MySQL InnoDB data metrics
mysql.x	10	YES	MySQL X plugin metrics
mysql.x.stmt	10	YES	MySQL X plugin statement statistics
mysql.stats	10	YES	MySQL core metrics
mysql.stats.com	10	YES	MySQL command stats
mysql.stats.connection	10	YES	MySQL connection stats
mysql.stats.handler	10	YES	MySQL handler stats
mysql.stats.ssl	10	YES	MySQL TLS related stats
mysql.myisam	10	YES	MySQL MyISAM storage engine stats
mysql.perf_schema	10	YES	MySQL performance_schema lost instruments

[FREQUENCY](#) and [ENABLED](#) can be edited. For example, to update the frequency of the mysql.inno metrics:

```
mysql>update performance_schema.setup_meters set FREQUENCY='30' where name = 'mysql.inno';
```

The maximum number of meter instruments which can be created is set by [performance\\_schema\\_max\\_meter\\_classes](#).

### 35.4.3 Server Metrics

The following server metrics are registered by default:

- [mysql.stats Metrics](#)
- [mysql.stats.com Metrics](#)
- [mysql.stats.connection Metrics](#)
- [mysql.perf\\_schema Metrics](#)
- [mysql.stats.handler Metrics](#)
- [mysql.stats.myisam Metrics](#)
- [mysql.stats.ssl Metrics](#)
- [mysql.inno Metrics](#)
- [mysql.inno.buffer\\_pool Metrics](#)
- [mysql.inno.data Metrics](#)
- [mysql.x Metrics](#)
- [mysql.x.stmt Metrics](#)

The maximum number of metric instruments which can be created is set by `performance_schema_max_metric_classes`.

## mysql.stats Metrics

**Table 35.3 mysql.stats Metrics**

Name	Source Variable	OTEL Type	Description
aborted_clients	Aborted_clients	ASYNC COUNTER	The number of connections that were aborted because the client died without closing the connection properly
aborted_connects	Aborted_connects	ASYNC COUNTER	The number of failed attempts to connect to the MySQL server
acl_cache_items	Aclcache_items	ASYNC GAUGE COUNTER	The number of cached privilege objects
binlog_cache.size	Binlog_cache_size	ASYNC COUNTER	The number of transactions that used the temporary binary log cache but that exceeded the value of binlog_cache_size and used a temporary file to store statements from the transaction
binlog_cache.usages	Binlog_cache_usages	ASYNC COUNTER	The number of transactions that used the binary log cache.
binlog_stmt_cache.size	Binlog_stmt_cache_size	ASYNC COUNTER	The number of nontransaction statements that used the binary log statement cache but that exceeded the value of binlog_stmt_cache_size and used a temporary file to store those statements.
binlog_stmt_cache.usages	Binlog_stmt_cache_usages	ASYNC COUNTER	The number of nontransactional statements that used the binary log statement cache
bytes_received	Bytes_received	ASYNC COUNTER	The number of bytes received from all clients
bytes_sent	Bytes_sent	ASYNC COUNTER	The number of bytes sent to all clients
created.tmp_disk_tables	Created_tmp_disk_tables	ASYNC COUNTER	The number of internal on-disk temporary tables created by the server while executing statements
created.tmp_files	Created_tmp_files	ASYNC COUNTER	How many temporary files mysqld has created
created.tmp_tables	Created_tmp_tables	ASYNC COUNTER	The number of internal temporary tables created by the server while executing statements
error_log.buffered_bytes	Error_log_buffered_bytes	ASYNC GAUGE COUNTER	The number of bytes currently used in the Performance Schema error_log table
error_log.buffered_events	Error_log_buffered_events	ASYNC GAUGE COUNTER	The number of events currently present in the Performance Schema error_log table
error_log.expired_events	Error_log_expired_events	ASYNC COUNTER	The number of events discarded from the Performance Schema error_log table to make room for new events

Name	Source Variable	OTEL Type	Description
flush_commands	Flush_commands	ASYNC COUNTER	The number of times the server flushes tables
global_connections	Global_connections	ASYNC GAUGE COUNTER	The memory used by all user connections to the server
locked_connects	Locked_connects	ASYNC COUNTER	The number of attempts to connect to locked user accounts
max_execution_time_exceeded	Max_execution_time_exceeded	ASYNC COUNTER	The number of SELECT statements for which the execution timeout was exceeded
max_execution_time_set	Max_execution_time_set	ASYNC COUNTER	The number of SELECT statements for which a nonzero execution timeout was set
max_execution_time_failed	Max_execution_time_failed	ASYNC COUNTER	The number of SELECT statements for which the attempt to set an execution timeout failed
max_used_connections	Max_used_connections	ASYNC GAUGE COUNTER	The maximum number of connections that have been in use simultaneously since the server started
ongoing_anonymous_transactions	Ongoing_anonymous_transactions	ASYNC GAUGE COUNTER	Shows the number of ongoing transactions which have been marked as anonymous
open_files	Open_files	ASYNC COUNTER	The number of files that are open. This count includes regular files opened by the server.
open_streams	Open_streams	ASYNC COUNTER	The number of streams that are open, used mainly for logging
open_table_definitions	Open_table_definitions	ASYNC GAUGE COUNTER	The number of cached table definitions
open_tables	Open_tables	ASYNC GAUGE COUNTER	The number of tables that are open.
opened_files	Opened_files	ASYNC COUNTER	The number of files that have been opened with <code>my_open()</code> .
opened_table_definitions	Opened_table_definitions	ASYNC GAUGE COUNTER	The number of table definitions that have been cached.
opened_tables	Opened_tables	ASYNC COUNTER	The number of tables that have been opened
prepared_stmt_count	Prepared_stmt_count	ASYNC GAUGE COUNTER	The current number of prepared statements
queries	Queries	ASYNC COUNTER	The number of statements executed by the server, including ones executed within stored programs. It does not count <code>COM_PING</code> or <code>COM_STATISTICS</code> commands.
questions	Questions	ASYNC COUNTER	The number of statements executed by the server. This includes only statements sent to the server by clients and not statements executed within stored programs.

## Server Metrics

---

Name	Source Variable	OTEL Type	Description
replica_open_temp_tables	replica_open_temp_tables	ASYNC GAUGE COUNTER	Number of temporary tables that the replication SQL thread currently has open.
secondary_engines	secondary_engines	ASYNC COUNTER	The number of queries offloaded to a secondary engine
select_full_joins	Select_full_joins	ASYNC COUNTER	The number of joins that perform table scans because they do not use indexes
select_full_range_joins	Select_full_range_joins	ASYNC COUNTER	The number of joins that used a range search on a reference table
select_range	Select_range	ASYNC COUNTER	The number of joins that used ranges on the first table
select_range_checks	Select_range_checks	ASYNC COUNTER	The number of joins without keys that check for key usage after each row
select_scan	Select_scan	ASYNC COUNTER	The number of joins that did a full scan of the first table
slow_launch_threads	slow_launch_threads	ASYNC COUNTER	The number of threads that have taken more than slow_launch_time seconds to create.
slow_queries	Slow_queries	ASYNC COUNTER	The number of queries that have taken more than long_query_time seconds
sort_merge_passes	Sort_merge_passes	ASYNC COUNTER	The number of merge passes that the sort algorithm has had to do
sort_range	Sort_range	ASYNC COUNTER	The number of sorts that were done using ranges
sort_rows	Sort_rows	ASYNC COUNTER	The number of sorted rows.
sort_scan	Sort_scan	ASYNC COUNTER	The number of sorts that were done by scanning the table.
table_locks_immediate	Table_locks_immediate	ASYNC COUNTER	The number of times that a request for a table lock could be granted immediately
table_locks_waited	Table_locks_waited	ASYNC COUNTER	The number of times that a request for a table lock could not be granted immediately and a wait was needed.
table_open_cache_hits	Tables_open_cache_hits	ASYNC COUNTER	The number of hits for open tables cache lookups.
table_open_cache_misses	Tables_open_cache_misses	ASYNC COUNTER	The number of misses for open tables cache lookups.
table_open_cache_overflows	Tables_open_cache_overflows	ASYNC COUNTER	The number of overflows for the open tables cache.
tc_log_page_waits	Tc_log_page_waits	ASYNC COUNTER	For the memory-mapped implementation of the recovery log, this variable increments each time the server was not able to commit a transaction and had to wait for a free page in the log.
threads_cached	Threads_cached	ASYNC GAUGE COUNTER	The number of threads in the thread cache.
threads_connected	Threads_connected	ASYNC GAUGE COUNTER	The number of currently open connections

Name	Source Variable	OTEL Type	Description
threads_created	Threads_created	ASYNC GAUGE COUNTER	The number of threads created to handle connections.
threads_running	Threads_running	ASYNC GAUGE COUNTER	The number of threads that are not sleeping.
uptime	Uptime	ASYNC COUNTER	The number of seconds that the server has been up.

## mysql.stats.com Metrics

The `mysql.stats.com` metrics correspond to the `Com_xxx` statement counter variables. See [Section 7.1.10, “Server Status Variables”](#) and `Com_xxx` for more information.

The `mysql.stats.com` metrics are named for those variables, without the `Com_` prefix. For example, the `select` metric corresponds to the `Com_select` statement counter variable.

These metrics are of OTEL Type `ASYNC COUNTER` and record the number of times (INTEGER) the corresponding command statement has been executed.

## mysql.stats.connection Metrics

The `mysql.stats.connection` metrics correspond to the `Connections` and `Connection_xxx` status variables.

**Table 35.4 mysql.stats.connection Metrics**

Name	Source Variable	OTEL Type	Description
total	Connections	ASYNC COUNTER	Cumulative count of total connections created.
errors_accept	Connection_errors_accept	ASYNC COUNTER	The number of errors that occurred during calls to <code>accept()</code> on the listening port.
errors_internal	Connection_errors_internal	ASYNC COUNTER	The number of connections refused due to internal errors in the server, such as failure to start a new thread or an out-of-memory condition.
errors_max_connections	Connection_errors_max_connections	ASYNC COUNTER	The number of connections refused because the server <code>max_connections</code> limit was reached.
errors_peer_address	Connection_errors_peer_address	ASYNC COUNTER	The number of errors that occurred while searching for connecting client IP addresses.
errors_select	Connection_errors_select	ASYNC COUNTER	The number of errors that occurred during calls to <code>select()</code> or <code>poll()</code> on the listening port.
errors_tcpwrap	Connection_errors_tcpwrap	ASYNC COUNTER	The number of connections refused by the <code>libwrap</code> library.

## mysql.perf\_schema Metrics

The `mysql.perf_schema` correspond to the `Performance_schema_xxx` status variables. See [Section 29.7, “Performance Schema Status Monitoring”](#).

**Table 35.5 mysql.perf\_schema Metrics**

Name	Source Variable	OTEL Type	Description
accounts_lost	Performance_schema.accounts_lost	ASYNC_COUNTER	The number of times a row could not be added to the accounts table because it was full.
cond_classes_lost	Performance_schema.cond_classes_lost	ASYNC_COUNTER	How many condition instruments could not be loaded.
cond_instances_lost	Performance_schema.cond_instances_lost	ASYNC_COUNTER	How many condition instrument instances could not be created.
digest_lost	Performance_schema.digest_lost	ASYNC_DIGEST	The number of digest instances that could not be instrumented in the events_statements_summary_by_digest table.
file_classes_lost	Performance_schema.file_classes_lost	ASYNC_COUNTER	How many file instruments could not be loaded.
file_handles_lost	Performance_schema.file_handles_lost	ASYNC_COUNTER	How many file instrument instances could not be opened.
file_instances_lost	Performance_schema.file_instances_lost	ASYNC_COUNTER	How many file instrument instances could not be created.
hosts_lost	Performance_schema.hosts_lost	ASYNC_COUNTER	The number of times a row could not be added to the hosts table because it was full.
index_stat_lost	Performance_schema.index_stat_lost	ASYNC_INDEX	The number of indexes for which statistics were lost.
locker_lost	Performance_schema.locker_lost	ASYNC_COUNTER	How many events are lost or not recorded.
memory_classes_lost	Performance_schema.memory_classes_lost	ASYNC_COUNTER	The number of times a memory instrument could not be loaded.
metadata_lock_lost	Performance_schema.metadata_lock_lost	ASYNC_COUNTER	The number of metadata locks that could not be instrumented in the metadata_locks table.
meter_lost	Performance_schema.meter_lost	ASYNC_COUNTER	How many meter instruments could not be loaded.
metric_lost	Performance_schema.metric_lost	ASYNC_COUNTER	How many metric instruments could not be loaded.
mutex_classes_lost	Performance_schema.mutex_classes_lost	ASYNC_COUNTER	How many mutex instruments could not be loaded.
mutex_instances_lost	Performance_schema.mutex_instances_lost	ASYNC_COUNTER	How many mutex instrument instances could not be created.
nested_statements_lost	Performance_schema.nested_statements_lost	ASYNC_COUNTER	The number of stored program statements for which statistics were lost.
prepared_statements_lost	Performance_schema.prepared_statements_lost	ASYNC_COUNTER	The number of prepared statements that could not be instrumented in the prepared_statements_instances table.
program_lost	Performance_schema.program_lost	ASYNC_PROGRAM	The number of stored programs for which statistics were lost.
rwlock_classes_lost	Performance_schema.rwlock_classes_lost	ASYNC_COUNTER	How many rwlock instruments could not be loaded.

Name	Source Variable	OTEL Type	Description
rwlock_instances	\$performance_schema.threads_rwlocks	ASYNC COUNTER	How many rwlock instrument instances could not be created.
session_connect	\$performance_schema.sessions	ASYNC COUNTER	Longest seen connection attribute received.
session_connect	\$performance_schema.sessions	ASYNC COUNTER	The number of connections for which connection attribute truncation has occurred
socket_classes	\$performance_schema.sockets	ASYNC COUNTER	How many socket instruments could not be loaded.
socket_instances	\$performance_schema.sockets	ASYNC COUNTER	How many socket instrument instances could not be created.
stage_classes_1	\$performance_schema.stages	ASYNC COUNTER	How many stage instruments could not be loaded.
statement_classes	\$performance_schema.statements	ASYNC COUNTER	How many statement instruments could not be loaded.
table_handles_1	\$performance_schema.tables	ASYNC COUNTER	How many table instrument instances could not be opened.
table_instances	\$performance_schema.tables	ASYNC COUNTER	How many table instrument instances could not be created.
table_lock_stat	\$performance_schema.table_lock_stat	ASYNC COUNTER	The number of tables for which lock statistics were lost.
thread_classes	\$performance_schema.threads	ASYNC COUNTER	How many thread instruments could not be loaded.
thread_instances	\$performance_schema.threads	ASYNC COUNTER	The number of thread instances that could not be instrumented in the <code>threads</code> table.
users_lost	Performance_schema.users	ASYNC COUNTER	The number of times a row could not be added to the <code>users</code> table because it was full.

## mysql.stats.handler Metrics

The `mysql.stats.handler` metrics correspond to the `Handler_XXX` status variables.

**Table 35.6 mysql.perf\_schema Metrics**

Name	Source Variable	OTEL Type	Description
commit	Handler_commit	ASYNC COUNTER	The number of internal COMMIT statements.
delete	Handler_delete	ASYNC COUNTER	The number of times that rows have been deleted from tables
discover	Handler_discover	ASYNC COUNTER	The number of times that tables have been discovered.
external_lock	Handler_external	ASYNC COUNTER	The server increments this variable for each call to its <code>external_lock()</code> function, which generally occurs at the beginning and end of access to a table instance.
mrr_init	Handler_mrr_init	ASYNC COUNTER	The number of times the server uses a storage engine's own Multi-Range Read implementation for table access.

Name	Source Variable	OTEL Type	Description
prepare	Handler_prepare	ASYNC COUNTER	A counter for the prepare phase of two-phase commit operations.
read_first	Handler_read_fi	ASYNC COUNTER	The number of times the first entry in an index was read.
read_key	Handler_read_key	ASYNC COUNTER	The number of requests to read a row based on a key.
read_last	Handler_read_la	ASYNC COUNTER	The number of requests to read the last key in an index.
read_next	Handler_read_ne	ASYNC COUNTER	The number of requests to read the next row in key order.
read_prev	Handler_read_pr	ASYNC COUNTER	The number of requests to read the previous row in key order.
read_rnd	Handler_read_rn	ASYNC COUNTER	The number of requests to read a row based on a fixed position.
read_rnd_next	Handler_read_rn	ASYNC COUNTER	The number of requests to read the next row in the data file.
rollback	Handler_rollback	ASYNC COUNTER	The number of requests for a storage engine to perform a rollback operation.
savepoint	Handler_savepoi	ASYNC COUNTER	The number of requests for a storage engine to place a savepoint.
savepoint_rollback	Handler_savepoi	ASYNC COUNTER	The number of requests for a storage engine to roll back to a savepoint.
update	Handler_update	ASYNC COUNTER	The number of requests to update a row in a table.
write	Handler_write	ASYNC COUNTER	The number of requests to insert a row in a table.

## mysql.stats.myisam Metrics

Table 35.7 mysql.perf\_schema Metrics

Name	Source Variable	OTEL Type	Description
key_blocks_not_flushed	key_blocks_not_flushed	ASYNC COUNTER	The number of key blocks in the MyISAM key cache that have changed but have not yet been flushed to disk.
key_blocks_unused	key_blocks_unused	ASYNC COUNTER	The number of unused blocks in the MyISAM key cache.
key_blocks_used	key_blocks_used	ASYNC COUNTER	The number of used blocks in the MyISAM key cache.
key_read_requests	key_read_requests	ASYNC COUNTER	The number of requests to read a key block from the MyISAM key cache.
key_reads	key_reads	ASYNC COUNTER	The number of physical reads of a key block from disk into the MyISAM key cache.
key_write_requests	key_write_requests	ASYNC COUNTER	The number of requests to write a key block to the MyISAM key cache.
key_writes	key_writes	ASYNC COUNTER	The number of physical writes of a key block from the MyISAM key cache to disk.

## mysql.stats.ssl Metrics

**Table 35.8 mysql.stats.ssl Metrics**

Name	Source Variable	OTEL Type	Description
client_connects	Ssl_client_connects	ASYNC COUNTER	The number of SSL connection attempts to an SSL-enabled replication source server.
connect_renegotiates	Ssl_connect_renegotiates	ASYNC COUNTER	The number of negotiates needed to establish the connection to an SSL-enabled replication source server.
finished_accepts	Ssl_finished_accepts	ASYNC COUNTER	The number of successful SSL connections to the server.
finished_connections	Ssl_finished_connections	ASYNC COUNTER	The number of successful replica connections to an SSL-enabled replication source server.
session_cache_hits	Ssl_session_cache_hits	ASYNC COUNTER	The number of SSL session cache hits.
session_cache_misses	Ssl_session_cache_misses	ASYNC COUNTER	The number of SSL session cache misses.
session_cache_overflows	Ssl_session_cache_overflows	ASYNC COUNTER	The number of SSL session cache overflows.
session_cache_size	Ssl_session_cache_size	ASYNC COUNTER	The SSL session cache size.
session_cache_timeouts	Ssl_session_cache_timeouts	ASYNC COUNTER	The number of SSL session cache timeouts.
used_session_cache_entries	Ssl_used_sessions_entries	ASYNC COUNTER	How many SSL session cache entries were used.
accept_renegotiations	Ssls_accept_renegotiations	ASYNC COUNTER	The number of negotiates needed to establish the connection.
accepts	Ssl_accepts	ASYNC COUNTER	The number of accepted SSL connections.
callback_cache_hits	Ssls_callback_cache_hits	ASYNC COUNTER	The number of callback cache hits.

## mysql.inno Metrics

**Table 35.9 mysql.inno Metrics**

Name	Source Variable	OTEL Type	Description
dblwr_pages_written	Innodb_dblwr_pages_written	ASYNC COUNTER	Number of pages that have been written for doublewrite operations
dblwr_writes	Innodb_dblwr_writes	ASYNC COUNTER	Number of doublewrite operations that have been performed
redo_log_logical_size	Innodb_redo_log_logical_size	ASYNC GAUGE	LSN range size in bytes containing in-use redo log data.
redo_log_physical_size	Innodb_redo_log_physical_size	ASYNC GAUGE	Disk space in bytes currently consumed by all redo log files on disk, excluding spare redo log files
redo_log_capacity	Innodb_redo_log_capacity	ASYNC GAUGE	Redo log capacity in bytes for all redo log files, after the last completed capacity resize operation
log_waits	Innodb_log_waits	ASYNC COUNTER	Number of log waits due to small log buffer

## Server Metrics

---

Name	Source Variable	OTEL Type	Description
log_write_requests	Innodb_log_write	ASYNC COUNTER	Number of log write requests
log_writes	Innodb_log_write	ASYNC COUNTER	The number of physical writes to the InnoDB redo log file
os_log_fsyncs	Innodb_os_log_f	ASYNC COUNTER	Number of fsync log writes.
os_log_pending_fsyncs	Innodb_os_log_p	ASYNC GAUGE	Number of pending fsync writes.
os_log_pending_writes	Innodb_os_log_p	ASYNC GAUGE	Number of pending log file writes.
os_log_written	Innodb_os_log_w	ASYNC COUNTER	Bytes of log written.
page_size	Innodb_page_size	ASYNC GAUGE	InnoDB page size in bytes.
pages_created	Innodb_pages_cr	ASYNC COUNTER	Number of pages created
pages_read	Innodb_pages_rea	ASYNC COUNTER	Number of pages read.
pages_written	Innodb_pages_wr	ASYNC COUNTER	Number of pages written.
row_lock_current	Innodb_row_lock	ASYNC GAUGE	Number of row locks currently being waited for.
row_lock_time	Innodb_row_lock	ASYNC COUNTER	Time spent in acquiring row locks, in milliseconds
row_lock_time_avg	Innodb_row_lock	ASYNC GAUGE	The average time to acquire a row lock, in milliseconds
row_lock_time_max	Innodb_row_lock	ASYNC GAUGE	The maximum time to acquire a row lock, in milliseconds.
row_lock_waits	Innodb_row_lock	ASYNC COUNTER	Number of times a row lock had to be waited for.
rows_deleted	Innodb_rows_dele	ASYNC COUNTER	The number of rows inserted into InnoDB tables.
rows_read	Innodb_rows_rea	ASYNC COUNTER	The number of rows read from InnoDB tables
rows_updated	Innodb_rows_upd	ASYNC COUNTER	The number of rows updated in InnoDB tables.
system_rows_deleted	Innodb_system_r	ASYNC COUNTER	Number of rows deleted from InnoDB tables belonging to system-created schemas.
system_rows_inserted	Innodb_system_r	ASYNC COUNTER	Number of rows inserted into InnoDB tables belonging to system-created schemas
system_rows_read	Innodb_system_r	ASYNC COUNTER	Number of rows read from InnoDB tables belonging to system-created schemas.
system_rows_updated	Innodb_system_r	ASYNC COUNTER	Number of rows updated in InnoDB tables belonging to system-created schemas.
num_open_files	Innodb_num_open	ASYNC GAUGE	Number of files currently open.
truncated_status	Innodb_truncate	ASYNC COUNTER	Number of times output from the <code>SHOW ENGINE INNODB STATUS</code> statement has been truncated.

Name	Source Variable	OTEL Type	Description
undo_tablespaces	\$Innodb_undo_tablespaces	ASYNC COUNTER	Total number of undo tablespaces.
undo_tablespaces	\$Innodb_implicit_undo_tablespaces	ASYNC COUNTER	Number of user-created undo tablespaces.
undo_tablespaces	\$Innodb_active_undo_tablespaces	ASYNC COUNTER	Number of active undo tablespaces, including implicit and explicit tablespaces

## mysql.inno.buffer\_pool Metrics

Table 35.10 mysql.inno.buffer\_pool Metrics

Name	Source Variable	OTEL Type	Description
pages_data	Innodb_buffer_pages_in_use	ASYNC COUNTER	Buffer pages containing data.
bytes_data	Innodb_buffer_bytes_in_use	ASYNC COUNTER	Buffer bytes containing data.
pages_dirty	Innodb_buffer_pages_dirty	ASYNC COUNTER	Buffer pages currently dirty.
bytes_dirty	Innodb_buffer_bytes_dirty	ASYNC COUNTER	Buffer bytes currently dirty
pages_flushed	Innodb_buffer_pageflushes	ASYNC COUNTER	The number of requests to flush pages from the InnoDB buffer pool.
pages_free	Innodb_buffer_pages_free	ASYNC COUNTER	Buffer pages currently free.
pages_misc	Innodb_buffer_pages_misc	ASYNC COUNTER	Buffer pages for misc use such as row locks or the adaptive hash index.
pages_total	Innodb_buffer_pages_total	ASYNC COUNTER	Total buffer pool size in pages.
read_ahead_rnd	Innodb_buffer_page_reads_ahead_rnd	ASYNC COUNTER	The number of 'random' read-aheads initiated by InnoDB.
read_ahead	Innodb_buffer_page_reads_ahead	ASYNC COUNTER	Number of pages read as read ahead.
read_ahead_evict	Innodb_buffer_page_reads_ahead_evict	ASYNC COUNTER	Read-ahead pages evicted without being accessed.
read_requests	Innodb_buffer_page_reads_requests	ASYNC COUNTER	Number of logical read requests.
reads	Innodb_buffer_page_reads	ASYNC COUNTER	Number of reads directly from disk.
wait_free	Innodb_buffer_page_wait_free	ASYNC COUNTER	Number of times waited for free buffer.
write_requests	Innodb_buffer_page_write_requests	ASYNC COUNTER	Number of write requests.

## mysql.inno.data Metrics

Table 35.11 mysql.inno.data Metrics

Name	Source Variable	OTEL Type	Description
fsyncs	Innodb_data_fsyncs	ASYNC COUNTER	Number of <code>fsync()</code> calls.
pending_fsyncs	Innodb_data_pending_fsyncs	ASYNC COUNTER	Number of pending fsync operations.
pending_reads	Innodb_data_pending_reads	ASYNC COUNTER	The current number of pending reads

Name	Source Variable	OTEL Type	Description
pending_writes	Innodb_data_pending	ASYNC GAUGE COUNTER	The current number of pending writes.
read	Innodb_data_read	ASYNC COUNTER	Amount of data read in bytes.
reads	Innodb_data_reads	ASYNC COUNTER	Number of reads initiated.
writes	Innodb_data_written	ASYNC COUNTER	Number of writes initiated.
written	Innodb_data_written	ASYNC COUNTER	Amount of data written in bytes.

## mysqlx Metrics

Table 35.12 mysqlx Metrics

Name	Source Variable	OTEL Type	Description
aborted_clients	Mysqlx_aborted_clients	ASYNC COUNTER	The number of clients that were disconnected because of an input or output error.
bytes_received	Mysqlx_bytes_received	ASYNC COUNTER	The total number of bytes received through the network, measured before decompression.
bytes_received_compressed	Mysqlx_bytes_received_compressed	ASYNC COUNTER	The number of bytes received as compressed message payloads, measured before decompression.
bytes_received_decompressed	Mysqlx_bytes_received_decompressed	ASYNC COUNTER	The number of bytes received as compressed message payloads, measured after decompression.
bytes_sent	Mysqlx_bytes_sent	ASYNC COUNTER	The total number of bytes sent through the network.
bytes_sent_compressed	Mysqlx_bytes_sent_compressed	ASYNC COUNTER	The number of bytes sent as compressed message payloads, measured after compression.
bytes_sent_uncompressed	Mysqlx_bytes_sent_uncompressed	ASYNC COUNTER	The number of bytes sent as compressed message payloads, measured before compression.
connection_accept_errors	Mysqlx_connection_accept_errors	ASYNC COUNTER	The number of connections which have caused accept errors.
connection_errors	Mysqlx_connection_errors	ASYNC COUNTER	The number of connections which have caused errors.
connections_accepted	Mysqlx_connections_accepted	ASYNC COUNTER	The number of connections which have been accepted.
connections_closed	Mysqlx_connections_closed	ASYNC COUNTER	The number of connections which have been closed.
connections_rejected	Mysqlx_connections_rejected	ASYNC COUNTER	The number of connections which have been rejected.
crud_create_view	Mysqlx_crud_create_view	ASYNC COUNTER	The number of create view requests received.
crud_delete	Mysqlx_crud_delete	ASYNC COUNTER	The number of delete requests received.
crud_drop_view	Mysqlx_crud_drop_view	ASYNC COUNTER	The number of drop view requests received.
crud_find	Mysqlx_crud_find	ASYNC COUNTER	The number of find requests received.

Name	Source Variable	OTEL Type	Description
crud_insert	Mysqlx_crud_insert	ASYNC COUNTER	The number of insert requests received.
crud_modify_view	Mysqlx_crud_modify_view	ASYNC COUNTER	The number of modify view requests received.
crud_update	Mysqlx_crud_update	ASYNC COUNTER	The number of update requests received.
cursor_close	Mysqlx_cursor_close	ASYNC COUNTER	The number of cursor-close messages received.
cursor_fetch	Mysqlx_cursor_fetch	ASYNC COUNTER	The number of cursor-fetch messages received.
cursor_open	Mysqlx_cursor_open	ASYNC COUNTER	The number of cursor-open messages received.
errors_sent	Mysqlx_errors_sent	ASYNC COUNTER	The number of errors sent to clients.
errors_unknown_message_type	Mysqlx_errors_unknown_message_type	ASYNC COUNTER	The number of unknown message types that have been received.
expect_close	Mysqlx_expect_close	ASYNC COUNTER	The number of expectation blocks closed.
expect_open	Mysqlx_expect_open	ASYNC COUNTER	The number of expectation blocks opened.
init_error	Mysqlx_init_error	ASYNC COUNTER	The number of errors during initialisation.
messages_sent	Mysqlx_messages_sent	ASYNC COUNTER	The total number of messages of all types sent to clients.
notice_global_send	Mysqlx_notice_global_send	ASYNC COUNTER	The number of global notifications sent to clients.
notice_other_send	Mysqlx_notice_other_send	ASYNC COUNTER	The number of other types of notices sent back to clients.
notice_warning_send	Mysqlx_notice_warning_send	ASYNC COUNTER	The number of warning notices sent back to clients.
notified_by_group	Mysqlx_notified_by_group	ASYNC COUNTER	Number of Group Replication notifications sent to clients.
prep_deallocate	Mysqlx_prep_deallocate	ASYNC COUNTER	The number of prepared-statement-deallocate messages received.
prep_execute	Mysqlx_prep_execute	ASYNC COUNTER	The number of prepared-statement-execute messages received.
prep_prepare	Mysqlx_prep_prepare	ASYNC COUNTER	The number of prepared-statement messages received.
rows_sent	Mysqlx_rows_sent	ASYNC COUNTER	The number of rows sent back to clients.
sessions	Mysqlx_sessions	ASYNC COUNTER	The number of sessions that have been opened.
sessions_accepted	Mysqlx_sessions_accepted	ASYNC COUNTER	The number of session attempts which have been accepted.
sessions_closed	Mysqlx_sessions_closed	ASYNC COUNTER	The number of sessions that have been closed.
sessions_fatal_error	Mysqlx_sessions_fatal_error	ASYNC COUNTER	The number of sessions that have closed with a fatal error.

Name	Source Variable	OTEL Type	Description
sessions_killed	Mysqlx_sessions	ASYNC COUNTER	The number of sessions which have been killed.
sessions_rejected	Mysqlx_sessions	ASYNC COUNTER	The number of session attempts which have been rejected.
ssl_accepts	Mysqlx_ssl_accepts	ASYNC COUNTER	The number of accepted SSL connections.
ssl_finished_accepted	Mysqlx_ssl_finished_accepted	ASYNC GAUGE	The number of successful SSL connections to the server.
worker_threads	Mysqlx_worker_threads	ASYNC GAUGE	The number of worker threads available.
worker_threads_used	Mysqlx_worker_threads_used	ASYNC COUNTER	The number of worker threads currently used.

## mysqlx stmt Metrics

Table 35.13 mysqlx(stmt) Metrics

Name	Source Variable	OTEL Type	Description
create_collection	Mysqlx_stmt_create_collection	ASYNC IDENTIFIER	The number of create collection statements received.
create_collection_index	Mysqlx_stmt_create_collection_index	ASYNC IDENTIFIER	The number of create collection index statements received.
disable_notices	Mysqlx_stmt_disable_notices	ASYNC COUNTER	The number of disable notice statements received.
drop_collection	Mysqlx_stmt_drop_collection	ASYNC COUNTER	The number of drop collection statements received.
drop_collection_index	Mysqlx_stmt_drop_collection_index	ASYNC COUNTER	The number of drop collection index statements received.
enable_notices	Mysqlx_stmt_enable_notices	ASYNC COUNTER	The number of enable notice statements received.
ensure_collection	Mysqlx_stmt_ensure_collection	ASYNC IDENTIFIER	The number of ensure collection statements received.
execute_myslqx	Mysqlx_stmt_execute_myslqx	ASYNC GAUGE	The number of StmtExecute messages received with namespace set to myslx.
execute_sql	Mysqlx_stmt_execute_sql	ASYNC COUNTER	The number of StmtExecute requests received for the SQL namespace.
get_collection_object	Mysqlx_stmt_get_collection_object	ASYNC COUNTER	The number of get collection object statements received.
kill_client	Mysqlx_stmt_kill_client	ASYNC COUNTER	The number of kill client statements received.
list_clients	Mysqlx_stmt_list_clients	ASYNC COUNTER	The number of list client statements received.
list_notices	Mysqlx_stmt_list_notices	ASYNC COUNTER	The number of list notice statements received.
list_objects	Mysqlx_stmt_list_objects	ASYNC COUNTER	The number of list object statements received.
modify_collection_options	Mysqlx_stmt_modify_collection_options	ASYNC IDENTIFIER	The number of modify collection options statements received.

Name	Source Variable	OTEL Type	Description
ping	Mysqlx_stmt_ping	ASYNC COUNTER	The number of ping statements received.

## A.1 MySQL 8.4 FAQ: General

A.1.1 Which version of MySQL is production-ready (GA)? .....	5103
A.1.2 Why did MySQL version numbering skip versions 6 and 7 and go straight to 8.0? .....	5104
A.1.3 Can MySQL do subqueries? .....	5104
A.1.4 Can MySQL perform multiple-table inserts, updates, and deletes? .....	5104
A.1.5 Does MySQL have Sequences? .....	5104
A.1.6 Does MySQL have a <code>NOW()</code> function with fractions of seconds? .....	5104
A.1.7 Does MySQL work with multi-core processors? .....	5104
A.1.8 Why do I see multiple processes for <code>mysqld</code> ? .....	5105
A.1.9 Can MySQL perform ACID transactions? .....	5105

### A.1.1. Which version of MySQL is production-ready (GA)?

MySQL 9.4, 8.4, and 8.0 are actively supported for production use.

The MySQL 9 Innovation series began with the MySQL 9.0.0 release on 01 July 2024.

The MySQL 8.4 LTS series began with the MySQL 8.4.0 release on 30 April 2024.

The MySQL 8 Innovation series began with the MySQL 8.1.0 release on 18 July 2023. Active development ended on 2024-01-16 with the MySQL 8.3.0 release.

MySQL 8.0 achieved General Availability (GA) status with MySQL 8.0.11, which was released for production use on 19 April 2018. It became a bugfix series as of MySQL 8.0.34 with the introduction of the [Innovation and LTS release model](#).

MySQL 5.7 achieved General Availability (GA) status with MySQL 5.7.9, which was released for production use on 21 October 2015. Active development for MySQL 5.7 ended on 25 October 2023 with the MySQL 5.7.44 release.

MySQL 5.6 achieved General Availability (GA) status with MySQL 5.6.10, which was released for production use on 5 February 2013. Active development for MySQL 5.6 has ended.

MySQL 5.5 achieved General Availability (GA) status with MySQL 5.5.8, which was released for production use on 3 December 2010. Active development for MySQL 5.5 has ended.

MySQL 5.1 achieved General Availability (GA) status with MySQL 5.1.30, which was released for production use on 14 November 2008. Active development for MySQL 5.1 has ended.

MySQL 5.0 achieved General Availability (GA) status with MySQL 5.0.15, which was released for production use on 19 October 2005. Active development for MySQL 5.0 has ended.

#### A.1.2. Why did MySQL version numbering skip versions 6 and 7 and go straight to 8.0?

Due to the many new and important features we were introducing in this MySQL version, we decided to start a fresh new series. As the series numbers 6 and 7 had actually been used before by MySQL, we went to 8.0.

#### A.1.3. Can MySQL do subqueries?

Yes. See [Section 15.2.15, “Subqueries”](#).

#### A.1.4. Can MySQL perform multiple-table inserts, updates, and deletes?

Yes. For the syntax required to perform multiple-table updates, see [Section 15.2.17, “UPDATE Statement”](#); for that required to perform multiple-table deletes, see [Section 15.2.2, “DELETE Statement”](#).

A multiple-table insert can be accomplished using a trigger whose `FOR EACH ROW` clause contains multiple `INSERT` statements within a `BEGIN ... END` block. See [Section 27.3, “Using Triggers”](#).

#### A.1.5. Does MySQL have Sequences?

No. However, MySQL has an `AUTO_INCREMENT` system, which can also handle inserts in a multi-source replication setup. With the `auto_increment_increment` and `auto_increment_offset` system variables, you can set each server to generate auto-increment values that don't conflict with other servers. The `auto_increment_increment` value should be greater than the number of servers, and each server should have a unique offset.

#### A.1.6. Does MySQL have a `NOW( )` function with fractions of seconds?

Yes, see [Section 13.2.6, “Fractional Seconds in Time Values”](#).

#### A.1.7. Does MySQL work with multi-core processors?

Yes. MySQL is fully multithreaded, and makes use of all CPUs made available to it. Not all CPUs may be available; modern operating systems should be able to utilize all underlying CPUs, but also make it possible to restrict a process to a specific CPU or sets of CPUs.

On Windows, there is currently a limit to the number of (logical) processors that `mysqld` can use: a single processor group, which is limited to a maximum of 64 logical processors.

Use of multiple cores may be seen in these ways:

- A single core is usually used to service the commands issued from one session.
- A few background threads make limited use of extra cores; for example, to keep background I/O tasks moving.
- If the database is I/O-bound (indicated by CPU consumption less than capacity), adding more CPUs is futile. If the database is partitioned into an I/O-bound part and a CPU-bound part, adding CPUs may still be useful.

**A.1.8.** Why do I see multiple processes for `mysqld`?

`mysqld` is a single-process program, not a multi-process program, and does not fork or launch other processes. However, `mysqld` is multithreaded and some process-reporting system utilities display separate entries for each thread of multithreaded processes, which may lead to the appearance of multiple `mysqld` processes when in fact there is only one.

**A.1.9.** Can MySQL perform ACID transactions?

Yes. All current MySQL versions support transactions. The `InnoDB` storage engine offers full ACID transactions with row-level locking, multi-versioning, nonlocking repeatable reads, and all four SQL standard isolation levels.

The `NDB` storage engine supports the `READ COMMITTED` transaction isolation level only.

## A.2 MySQL 8.4 FAQ: Storage Engines

A.2.1 Where can I obtain complete documentation for MySQL storage engines? .....	5105
A.2.2 Are there any new storage engines in MySQL 8.4? .....	5105
A.2.3 Have any storage engines been removed in MySQL 8.4? .....	5105
A.2.4 Can I prevent the use of a particular storage engine? .....	5105
A.2.5 Is there an advantage to using the <code>InnoDB</code> storage engine exclusively, as opposed to a combination of <code>InnoDB</code> and non- <code>InnoDB</code> storage engines? .....	5105
A.2.6 What are the unique benefits of the <code>ARCHIVE</code> storage engine? .....	5105

**A.2.1.** Where can I obtain complete documentation for MySQL storage engines?

See [Chapter 18, Alternative Storage Engines](#). That chapter contains information about all MySQL storage engines except for the `InnoDB` storage engine and the `NDB` storage engine (used for MySQL Cluster). `InnoDB` is covered in [Chapter 17, The InnoDB Storage Engine](#). `NDB` is covered in [Chapter 25, MySQL NDB Cluster 8.4](#).

**A.2.2.** Are there any new storage engines in MySQL 8.4?

No. `InnoDB` is the default storage engine for new tables. See [Section 17.1, “Introduction to InnoDB”](#) for details.

**A.2.3.** Have any storage engines been removed in MySQL 8.4?

No.

**A.2.4.** Can I prevent the use of a particular storage engine?

Yes. The `disabled_storage_engines` configuration option defines which storage engines cannot be used to create tables or tablespaces. By default, `disabled_storage_engines` is empty (no engines disabled), but it can be set to a comma-separated list of one or more engines.

**A.2.5.** Is there an advantage to using the `InnoDB` storage engine exclusively, as opposed to a combination of `InnoDB` and non-`InnoDB` storage engines?

Yes. Using `InnoDB` tables exclusively can simplify backup and recovery operations. MySQL Enterprise Backup does a [hot backup](#) of all tables that use the `InnoDB` storage engine. For tables using `MyISAM` or other non-`InnoDB` storage engines, it does a “warm” backup, where the database continues to run, but those tables cannot be modified while being backed up. See [Section 32.1, “MySQL Enterprise Backup Overview”](#).

**A.2.6.** What are the unique benefits of the `ARCHIVE` storage engine?

The `ARCHIVE` storage engine stores large amounts of data without indexes; it has a small footprint, and performs selects using table scans. See [Section 18.5, “The ARCHIVE Storage Engine”](#), for details.

## A.3 MySQL 8.4 FAQ: Server SQL Mode

A.3.1 What are server SQL modes? .....	5106
A.3.2 How many server SQL modes are there? .....	5106
A.3.3 How do you determine the server SQL mode? .....	5106
A.3.4 Is the mode dependent on the database or connection? .....	5106
A.3.5 Can the rules for strict mode be extended? .....	5106
A.3.6 Does strict mode impact performance? .....	5106
A.3.7 What is the default server SQL mode when MySQL 8.4 is installed? .....	5106

### A.3.1. What are server SQL modes?

Server SQL modes define what SQL syntax MySQL should support and what kind of data validation checks it should perform. This makes it easier to use MySQL in different environments and to use MySQL together with other database servers. The MySQL Server apply these modes individually to different clients. For more information, see [Section 7.1.11, “Server SQL Modes”](#).

### A.3.2. How many server SQL modes are there?

Each mode can be independently switched on and off. See [Section 7.1.11, “Server SQL Modes”](#), for a complete list of available modes.

### A.3.3. How do you determine the server SQL mode?

You can set the default SQL mode (for `mysqld` startup) with the `--sql-mode` option. Using the statement `SET [GLOBAL|SESSION] sql_mode='modes'`, you can change the settings from within a connection, either locally to the connection, or to take effect globally. You can retrieve the current mode by issuing a `SELECT @@sql_mode` statement.

### A.3.4. Is the mode dependent on the database or connection?

A mode is not linked to a particular database. Modes can be set locally to the session (connection), or globally for the server. you can change these settings using `SET [GLOBAL|SESSION] sql_mode='modes'`.

### A.3.5. Can the rules for strict mode be extended?

When we refer to *strict mode*, we mean a mode where at least one of the modes `TRADITIONAL`, `STRICT_TRANS_TABLES`, or `STRICT_ALL_TABLES` is enabled. Options can be combined, so you can add restrictions to a mode. See [Section 7.1.11, “Server SQL Modes”](#), for more information.

### A.3.6. Does strict mode impact performance?

The intensive validation of input data that some settings requires more time than if the validation is not done. While the performance impact is not that great, if you do not require such validation (perhaps your application already handles all of this), then MySQL gives you the option of leaving strict mode disabled. However, if you do require it, strict mode can provide such validation.

### A.3.7. What is the default server SQL mode when MySQL 8.4 is installed?

The default SQL mode in MySQL 8.0 includes these modes: `ONLY_FULL_GROUP_BY`, `STRICT_TRANS_TABLES`, `NO_ZERO_IN_DATE`, `NO_ZERO_DATE`, `ERROR_FOR_DIVISION_BY_ZERO`, and `NO_ENGINE_SUBSTITUTION`.

For information about all available modes and default MySQL behavior, see [Section 7.1.11, “Server SQL Modes”](#).

## A.4 MySQL 8.4 FAQ: Stored Procedures and Functions

A.4.1 Does MySQL support stored procedures and functions? .....	5107
-----------------------------------------------------------------	------

A.4.2 Where can I find documentation for MySQL stored procedures and stored functions? .....	5107
A.4.3 Is there a discussion forum for MySQL stored procedures? .....	5107
A.4.4 Where can I find the ANSI SQL 2003 specification for stored procedures? .....	5107
A.4.5 How do you manage stored routines? .....	5107
A.4.6 Is there a way to view all stored procedures and stored functions in a given database? .....	5107
A.4.7 Where are stored procedures stored? .....	5108
A.4.8 Is it possible to group stored procedures or stored functions into packages? .....	5108
A.4.9 Can a stored procedure call another stored procedure? .....	5108
A.4.10 Can a stored procedure call a trigger? .....	5108
A.4.11 Can a stored procedure access tables? .....	5108
A.4.12 Do stored procedures have a statement for raising application errors? .....	5108
A.4.13 Do stored procedures provide exception handling? .....	5108
A.4.14 Can MySQL stored routines return result sets? .....	5108
A.4.15 Is <code>WITH RECOMPILE</code> supported for stored procedures? .....	5108
A.4.16 Is there a MySQL equivalent to using <code>mod_plsql</code> as a gateway on Apache to talk directly to a stored procedure in the database? .....	5108
A.4.17 Can I pass an array as input to a stored procedure? .....	5109
A.4.18 Can I pass a cursor as an <code>IN</code> parameter to a stored procedure? .....	5109
A.4.19 Can I return a cursor as an <code>OUT</code> parameter from a stored procedure? .....	5109
A.4.20 Can I print out a variable's value within a stored routine for debugging purposes? .....	5109
A.4.21 Can I commit or roll back transactions inside a stored procedure? .....	5109
A.4.22 Do MySQL stored procedures and functions work with replication? .....	5109
A.4.23 Are stored procedures and functions created on a replication source server replicated to a replica? .....	5109
A.4.24 How are actions that take place inside stored procedures and functions replicated? .....	5109
A.4.25 Are there special security requirements for using stored procedures and functions together with replication? .....	5109
A.4.26 What limitations exist for replicating stored procedure and function actions? .....	5109
A.4.27 Do the preceding limitations affect the ability of MySQL to do point-in-time recovery? .....	5110
A.4.28 What is being done to correct the aforementioned limitations? .....	5110

**A.4.1.** Does MySQL support stored procedures and functions?

Yes. MySQL supports two types of stored routines, stored procedures, and stored functions.

**A.4.2.** Where can I find documentation for MySQL stored procedures and stored functions?

See [Section 27.2, “Using Stored Routines”](#).

**A.4.3.** Is there a discussion forum for MySQL stored procedures?

Yes. See <https://forums.mysql.com/list.php?98>.

**A.4.4.** Where can I find the ANSI SQL 2003 specification for stored procedures?

Unfortunately, the official specifications are not freely available (ANSI makes them available for purchase). However, there are books, such as *SQL-99 Complete, Really* by Peter Gulutzan and Trudy Pelzer, that provide a comprehensive overview of the standard, including coverage of stored procedures.

**A.4.5.** How do you manage stored routines?

It is always good practice to use a clear naming scheme for your stored routines. You can manage stored procedures with `CREATE [ FUNCTION | PROCEDURE ]`, `ALTER [ FUNCTION | PROCEDURE ]`, `DROP [ FUNCTION | PROCEDURE ]`, and `SHOW CREATE [ FUNCTION | PROCEDURE ]`. You can obtain information about existing stored procedures using the `ROUTINES` table in the `INFORMATION_SCHEMA` database (see [Section 28.3.30, “The INFORMATION\\_SCHEMA ROUTINES Table”](#)).

**A.4.6.** Is there a way to view all stored procedures and stored functions in a given database?

Yes. For a database named `dbname`, use this query on the `INFORMATION_SCHEMA.ROUTINES` table:

```
SELECT ROUTINE_TYPE, ROUTINE_NAME
 FROM INFORMATION_SCHEMA.ROUTINES
 WHERE ROUTINE_SCHEMA= 'dbname' ;
```

For more information, see [Section 28.3.30, “The INFORMATION\\_SCHEMA ROUTINES Table”](#).

The body of a stored routine can be viewed using `SHOW CREATE FUNCTION` (for a stored function) or `SHOW CREATE PROCEDURE` (for a stored procedure). See [Section 15.7.7.10, “SHOW CREATE PROCEDURE Statement”](#), for more information.

#### A.4.7. Where are stored procedures stored?

Stored procedures are stored in the `mysql.routines` and `mysql.parameters` tables, which are part of the data dictionary. You cannot access these tables directly. Instead, query the `INFORMATION_SCHEMA ROUTINES` and `PARAMETERS` tables. See [Section 28.3.30, “The INFORMATION\\_SCHEMA ROUTINES Table”](#), and [Section 28.3.20, “The INFORMATION\\_SCHEMA PARAMETERS Table”](#).

You can also use `SHOW CREATE FUNCTION` to obtain information about stored functions, and `SHOW CREATE PROCEDURE` to obtain information about stored procedures. See [Section 15.7.7.10, “SHOW CREATE PROCEDURE Statement”](#).

#### A.4.8. Is it possible to group stored procedures or stored functions into packages?

No. This is not supported in MySQL.

#### A.4.9. Can a stored procedure call another stored procedure?

Yes.

#### A.4.10 Can a stored procedure call a trigger?

A stored procedure can execute an SQL statement, such as an `UPDATE`, that causes a trigger to activate.

#### A.4.11 Can a stored procedure access tables?

Yes. A stored procedure can access one or more tables as required.

#### A.4.12 Do stored procedures have a statement for raising application errors?

Yes. MySQL implements the SQL standard `SIGNAL` and `RESIGNAL` statements. See [Section 15.6.7, “Condition Handling”](#).

#### A.4.13 Do stored procedures provide exception handling?

MySQL implements `HANDLER` definitions according to the SQL standard. See [Section 15.6.7.2, “DECLARE ... HANDLER Statement”](#), for details.

#### A.4.14 Can MySQL stored routines return result sets?

*Stored procedures* can, but stored functions cannot. If you perform an ordinary `SELECT` inside a stored procedure, the result set is returned directly to the client. You need to use the MySQL 4.1 (or higher) client/server protocol for this to work. This means that, for example, in PHP, you need to use the `mysqli` extension rather than the old `mysql` extension.

#### A.4.15 Is `WITH RECOMPILE` supported for stored procedures?

No.

#### A.4.16 Is there a MySQL equivalent to using `mod_plsql` as a gateway on Apache to talk directly to a stored procedure in the database?

There is no equivalent in MySQL.

**A.4.17** Can I pass an array as input to a stored procedure?

No.

**A.4.18** Can I pass a cursor as an `IN` parameter to a stored procedure?

Cursors are only available inside stored procedures.

**A.4.19** Can I return a cursor as an `OUT` parameter from a stored procedure?

Cursors are only available inside stored procedures. However, if you do not open a cursor on a `SELECT`, the result is sent directly to the client. You can also `SELECT INTO` variables. See [Section 15.2.13, “SELECT Statement”](#).

**A.4.20** Can I print out a variable's value within a stored routine for debugging purposes?

Yes, you can do this in a *stored procedure*, but not in a stored function. If you perform an ordinary `SELECT` inside a stored procedure, the result set is returned directly to the client. You must use the MySQL 4.1 (or above) client/server protocol for this to work. This means that, for example, in PHP, you need to use the `mysqli` extension rather than the old `mysql` extension.

**A.4.21** Can I commit or roll back transactions inside a stored procedure?

Yes. However, you cannot perform transactional operations within a stored function.

**A.4.22** Do MySQL stored procedures and functions work with replication?

Yes, standard actions carried out in stored procedures and functions are replicated from a replication source server to a replica. There are a few limitations that are described in detail in [Section 27.7, “Stored Program Binary Logging”](#).

**A.4.23** Are stored procedures and functions created on a replication source server replicated to a replica?

Yes, creation of stored procedures and functions carried out through normal DDL statements on a replication source server are replicated to a replica, so that the objects exist on both servers. `ALTER` and `DROP` statements for stored procedures and functions are also replicated.

**A.4.24** How are actions that take place inside stored procedures and functions replicated?

MySQL records each DML event that occurs in a stored procedure and replicates those individual actions to a replica. The actual calls made to execute stored procedures are not replicated.

Stored functions that change data are logged as function invocations, not as the DML events that occur inside each function.

**A.4.25** Are there special security requirements for using stored procedures and functions together with replication?

Yes. Because a replica has authority to execute any statement read from a source's binary log, special security constraints exist for using stored functions with replication. If replication or binary logging in general (for the purpose of point-in-time recovery) is active, then MySQL DBAs have two security options open to them:

1. Any user wishing to create stored functions must be granted the `SUPER` privilege.
2. Alternatively, a DBA can set the `log_bin_trust_function_creators` system variable to 1, which enables anyone with the standard `CREATE ROUTINE` privilege to create stored functions.

**A.4.26** What limitations exist for replicating stored procedure and function actions?

Nondeterministic (random) or time-based actions embedded in stored procedures may not replicate properly. By their very nature, randomly produced results are not predictable and cannot be exactly reproduced; therefore, random actions replicated to a replica do not mirror those performed on a source. Declaring stored functions to be `DETERMINISTIC` or setting the `log_bin_trust_function_creators` system variable to 0 keeps random operations producing random values from being invoked.

In addition, time-based actions cannot be reproduced on a replica because the timing of such actions in a stored procedure is not reproducible through the binary log used for replication. It records only DML events and does not factor in timing constraints.

Finally, nontransactional tables for which errors occur during large DML actions (such as bulk inserts) may experience replication issues in that a source may be partially updated from DML activity, but no updates are done to the replica because of the errors that occurred. A workaround is for a function's DML actions to be carried out with the `IGNORE` keyword so that updates on the source that cause errors are ignored and updates that do not cause errors are replicated to the replica.

**A.4.27** Do the preceding limitations affect the ability of MySQL to do point-in-time recovery?

The same limitations that affect replication do affect point-in-time recovery.

**A.4.28** What is being done to correct the aforementioned limitations?

You can choose either statement-based replication or row-based replication. The original replication implementation is based on statement-based binary logging. Row-based binary logging resolves the limitations mentioned earlier.

*Mixed* replication is also available (by starting the server with `--binlog-format=mixed`). This hybrid form of replication “knows” whether statement-level replication can safely be used, or row-level replication is required.

For additional information, see [Section 19.2.1, “Replication Formats”](#).

## A.5 MySQL 8.4 FAQ: Triggers

A.5.1 Where can I find the documentation for MySQL 8.4 triggers? .....	5110
A.5.2 Is there a discussion forum for MySQL Triggers? .....	5110
A.5.3 Does MySQL have statement-level or row-level triggers? .....	5110
A.5.4 Are there any default triggers? .....	5111
A.5.5 How are triggers managed in MySQL? .....	5111
A.5.6 Is there a way to view all triggers in a given database? .....	5111
A.5.7 Where are triggers stored? .....	5111
A.5.8 Can a trigger call a stored procedure? .....	5111
A.5.9 Can triggers access tables? .....	5111
A.5.10 Can a table have multiple triggers with the same trigger event and action time? .....	5111
A.5.11 Is it possible for a trigger to update tables on a remote server? .....	5111
A.5.12 Do triggers work with replication? .....	5111
A.5.13 How are actions carried out through triggers on a source replicated to a replica? .....	5112

**A.5.1.** Where can I find the documentation for MySQL 8.4 triggers?

See [Section 27.3, “Using Triggers”](#).

**A.5.2.** Is there a discussion forum for MySQL Triggers?

Yes. It is available at <https://forums.mysql.com/list.php?99>.

**A.5.3.** Does MySQL have statement-level or row-level triggers?

All triggers are `FOR EACH ROW`; that is, the trigger is activated for each row that is inserted, updated, or deleted. MySQL does not support triggers using `FOR EACH STATEMENT`.

**A.5.4.** Are there any default triggers?

Not explicitly. MySQL does have specific special behavior for some `TIMESTAMP` columns, as well as for columns which are defined using `AUTO_INCREMENT`.

**A.5.5.** How are triggers managed in MySQL?

Triggers can be created using the `CREATE TRIGGER` statement, and dropped using `DROP TRIGGER`. See [Section 15.1.22, “CREATE TRIGGER Statement”](#), and [Section 15.1.34, “DROP TRIGGER Statement”](#), for more about these statements.

Information about triggers can be obtained by querying the `INFORMATION_SCHEMA.TRIGGERS` table. See [Section 28.3.44, “The INFORMATION\\_SCHEMA TRIGGERS Table”](#).

**A.5.6.** Is there a way to view all triggers in a given database?

Yes. You can obtain a listing of all triggers defined on database `dbname` using a query on the `INFORMATION_SCHEMA.TRIGGERS` table such as the one shown here:

```
SELECT TRIGGER_NAME, EVENT_MANIPULATION, EVENT_OBJECT_TABLE, ACTION_STATEMENT
 FROM INFORMATION_SCHEMA.TRIGGERS
 WHERE TRIGGER_SCHEMA= 'dbname' ;
```

For more information about this table, see [Section 28.3.44, “The INFORMATION\\_SCHEMA TRIGGERS Table”](#).

You can also use the `SHOW TRIGGERS` statement, which is specific to MySQL. See [Section 15.7.7.40, “SHOW TRIGGERS Statement”](#).

**A.5.7.** Where are triggers stored?

Triggers are stored in the `mysql.triggers` system table, which is part of the data dictionary.

**A.5.8.** Can a trigger call a stored procedure?

Yes.

**A.5.9.** Can triggers access tables?

A trigger can access both old and new data in its own table. A trigger can also affect other tables, but it is not permitted to modify a table that is already being used (for reading or writing) by the statement that invoked the function or trigger.

**A.5.10.** Can a table have multiple triggers with the same trigger event and action time?

In MySQL 8.4, it is possible to define multiple triggers for a given table that have the same trigger event and action time. For example, you can have two `BEFORE UPDATE` triggers for a table. By default, triggers that have the same trigger event and action time activate in the order they were created. To affect trigger order, specify a clause after `FOR EACH ROW` that indicates `FOLLOWS` or `PRECEDES` and the name of an existing trigger that also has the same trigger event and action time. With `FOLLOWS`, the new trigger activates after the existing trigger. With `PRECEDES`, the new trigger activates before the existing trigger.

**A.5.11.** Is it possible for a trigger to update tables on a remote server?

Yes. A table on a remote server could be updated using the `FEDERATED` storage engine. (See [Section 18.8, “The FEDERATED Storage Engine”](#)).

**A.5.12.** Do triggers work with replication?

Yes. However, the way in which they work depends whether you are using MySQL’s “classic” statement-based or row-based replication format.

When using statement-based replication, triggers on the replica are executed by statements that are executed on the source (and replicated to the replica).

When using row-based replication, triggers are not executed on the replica due to statements that were run on the source and then replicated to the replica. Instead, when using row-based replication, the changes caused by executing the trigger on the source are applied on the replica.

For more information, see [Section 19.5.1.36, “Replication and Triggers”](#).

#### A.5.13 How are actions carried out through triggers on a source replicated to a replica?

Again, this depends on whether you are using statement-based or row-based replication.

**Statement-based replication.** First, the triggers that exist on a source must be re-created on the replica server. Once this is done, the replication flow works as any other standard DML statement that participates in replication. For example, consider a table `EMP` that has an `AFTER` insert trigger, which exists on a replication source server. The same `EMP` table and `AFTER` insert trigger exist on the replica server as well. The replication flow would be:

1. An `INSERT` statement is made to `EMP`.
2. The `AFTER` trigger on `EMP` activates.
3. The `INSERT` statement is written to the binary log.
4. The replica picks up the `INSERT` statement to `EMP` and executes it.
5. The `AFTER` trigger on `EMP` that exists on the replica activates.

**Row-based replication.** When you use row-based replication, the changes caused by executing the trigger on the source are applied on the replica. However, the triggers themselves are not actually executed on the replica under row-based replication. This is because, if both the source and the replica applied the changes from the source and, in addition, the trigger causing these changes were applied on the replica, the changes would in effect be applied twice on the replica, leading to different data on the source and the replica.

In most cases, the outcome is the same for both row-based and statement-based replication. However, if you use different triggers on the source and replica, you cannot use row-based replication. (This is because the row-based format replicates the changes made by triggers executing on the source to the replicas, rather than the statements that caused the triggers to execute, and the corresponding triggers on the replica are not executed.) Instead, any statements causing such triggers to be executed must be replicated using statement-based replication.

For more information, see [Section 19.5.1.36, “Replication and Triggers”](#).

## A.6 MySQL 8.4 FAQ: Views

A.6.1 Where can I find documentation covering MySQL Views? .....	5112
A.6.2 Is there a discussion forum for MySQL Views? .....	5112
A.6.3 What happens to a view if an underlying table is dropped or renamed? .....	5113
A.6.4 Does MySQL have table snapshots? .....	5113
A.6.5 Does MySQL have materialized views? .....	5113
A.6.6 Can you insert into views that are based on joins? .....	5113

#### A.6.1. Where can I find documentation covering MySQL Views?

See [Section 27.5, “Using Views”](#).

You may also find the [MySQL User Forums](#) to be helpful.

#### A.6.2. Is there a discussion forum for MySQL Views?

See the [MySQL User Forums](#).

**A.6.3.** What happens to a view if an underlying table is dropped or renamed?

After a view has been created, it is possible to drop or alter a table or view to which the definition refers. To check a view definition for problems of this kind, use the `CHECK TABLE` statement. (See [Section 15.7.3.2, “CHECK TABLE Statement”](#).)

**A.6.4.** Does MySQL have table snapshots?

No.

**A.6.5.** Does MySQL have materialized views?

No.

**A.6.6.** Can you insert into views that are based on joins?

It is possible, provided that your `INSERT` statement has a column list that makes it clear there is only one table involved.

You *cannot* insert into multiple tables with a single insert on a view.

## A.7 MySQL 8.4 FAQ: INFORMATION\_SCHEMA

A.7.1 Where can I find documentation for the MySQL <code>INFORMATION_SCHEMA</code> database? .....	5113
A.7.2 Is there a discussion forum for <code>INFORMATION_SCHEMA</code> ? .....	5113
A.7.3 Where can I find the ANSI SQL 2003 specification for <code>INFORMATION_SCHEMA</code> ? .....	5113
A.7.4 What is the difference between the Oracle Data Dictionary and MySQL <code>INFORMATION_SCHEMA</code> ? .....	5113
A.7.5 Can I add to or otherwise modify the tables found in the <code>INFORMATION_SCHEMA</code> database? 5113	

**A.7.1.** Where can I find documentation for the MySQL `INFORMATION_SCHEMA` database?

See [Chapter 28, “INFORMATION\\_SCHEMA Tables”](#).

You may also find the [MySQL User Forums](#) to be helpful.

**A.7.2.** Is there a discussion forum for `INFORMATION_SCHEMA`?

See the [MySQL User Forums](#).

**A.7.3.** Where can I find the ANSI SQL 2003 specification for `INFORMATION_SCHEMA`?

Unfortunately, the official specifications are not freely available. (ANSI makes them available for purchase.) However, there are books available, such as *SQL-99 Complete, Really* by Peter Gulutzan and Trudy Pelzer, that provide a comprehensive overview of the standard, including `INFORMATION_SCHEMA`.

**A.7.4.** What is the difference between the Oracle Data Dictionary and MySQL `INFORMATION_SCHEMA`?

Both Oracle and MySQL provide metadata in tables. However, Oracle and MySQL use different table names and column names. The MySQL implementation is more similar to those found in DB2 and SQL Server, which also support `INFORMATION_SCHEMA` as defined in the SQL standard.

**A.7.5.** Can I add to or otherwise modify the tables found in the `INFORMATION_SCHEMA` database?

No. Since applications may rely on a certain standard structure, this should not be modified. For this reason, we *cannot support bugs or other issues which result from modifying `INFORMATION_SCHEMA` tables or data*.

## A.8 MySQL 8.4 FAQ: Migration

A.8.1 Where can I find information on how to upgrade or downgrade MySQL? ..... 5114

### A.8.1.1. Where can I find information on how to upgrade or downgrade MySQL?

For detailed upgrade information, see [Chapter 3, Upgrading MySQL](#). Do not skip a major version when upgrading, but rather complete the process in steps, upgrading from one major version to the next in each step. This may seem more complicated, but ultimately saves time and trouble. If you encounter problems during the upgrade, their origin is easier to identify, either by you or, if you have a MySQL Enterprise subscription, by MySQL support.

## A.9 MySQL 8.4 FAQ: Security

A.9.1 Where can I find documentation that addresses security issues for MySQL? .....	5114
A.9.2 What is the default authentication plugin in MySQL 8.4? .....	5114
A.9.3 Does MySQL have native support for SSL? .....	5115
A.9.4 Is SSL support built into MySQL binaries, or must I recompile the binary myself to enable it? .....	5115
A.9.5 Does MySQL have built-in authentication against LDAP directories? .....	5115
A.9.6 Does MySQL include support for Roles Based Access Control (RBAC)? .....	5115
A.9.7 Does MySQL support TLS 1.0 and 1.1? .....	5115

### A.9.1.1. Where can I find documentation that addresses security issues for MySQL?

The best place to start is [Chapter 8, Security](#).

Other portions of the MySQL Documentation which you may find useful with regard to specific security concerns include the following:

- [Section 8.1.1, “Security Guidelines”](#).
- [Section 8.1.3, “Making MySQL Secure Against Attackers”](#).
- [Section B.3.3.2, “How to Reset the Root Password”](#).
- [Section 8.1.5, “How to Run MySQL as a Normal User”](#).
- [Section 8.1.4, “Security-Related mysqld Options and Variables”](#).
- [Section 8.1.6, “Security Considerations for LOAD DATA LOCAL”](#).
- [Section 2.9, “Postinstallation Setup and Testing”](#).
- [Section 8.3, “Using Encrypted Connections”](#).
- [Loadable Function Security Precautions](#).

There is also the [Secure Deployment Guide](#), which provides procedures for deploying a generic binary distribution of MySQL Enterprise Edition Server with features for managing the security of your MySQL installation.

### A.9.2.1. What is the default authentication plugin in MySQL 8.4?

The default authentication plugin as of MySQL 8.0 is `caching_sha2_password`. For information about this plugin, see [Section 8.4.1.2, “Caching SHA-2 Pluggable Authentication”](#).

The `caching_sha2_password` plugin provides more secure password encryption than the deprecated `mysql_native_password` plugin (the default plugin in MySQL versions before MySQL 8.0). For information about the implications of this change of default plugin for server operation and compatibility of the server with clients and connectors, see [caching\\_sha2\\_password as the Preferred Authentication Plugin](#).

For general information about pluggable authentication and other available authentication plugins, see [Section 8.2.17, “Pluggable Authentication”](#), and [Section 8.4.1, “Authentication Plugins”](#).

#### A.9.3. Does MySQL have native support for SSL?

Yes, the binaries have support for SSL connections between the client and server. See [Section 8.3, “Using Encrypted Connections”](#).

You can also tunnel a connection using SSH, if (for example) the client application does not support SSL connections. For an example, see [Section 8.3.4, “Connecting to MySQL Remotely from Windows with SSH”](#).

#### A.9.4. Is SSL support built into MySQL binaries, or must I recompile the binary myself to enable it?

Yes, the binaries have SSL enabled for client/server connections that are secured, authenticated, or both. See [Section 8.3, “Using Encrypted Connections”](#).

#### A.9.5. Does MySQL have built-in authentication against LDAP directories?

The Enterprise edition includes a [PAM Authentication Plugin](#) that supports authentication against an LDAP directory.

#### A.9.6. Does MySQL include support for Roles Based Access Control (RBAC)?

Not at this time.

#### A.9.7. Does MySQL support TLS 1.0 and 1.1?

Support for the TLSv1 and TLSv1.1 connection protocols is removed as of MySQL 8.0.28. The protocols were deprecated from MySQL 8.0.26. For the consequences of that removal, see [Removal of Support for the TLSv1 and TLSv1.1 Protocols](#).

Support for TLS versions 1.0 and 1.1 is removed because those protocol versions are old, released in 1996 and 2006, respectively. The algorithms used are weak and outdated.

Unless you are using very old versions of MySQL Server or connectors, you are unlikely to have connections using TLS 1.0 or 1.1. MySQL connectors and clients select the highest TLS version available by default.

*When was support for TLS 1.2 added to MySQL Server?* MySQL Community Server added TLS 1.2 support when the community server switched to OpenSSL for MySQL 5.6, 5.7, and 8.0 in 2019. For MySQL Enterprise Edition, OpenSSL added TLS 1.2 support in 2015, in MySQL Server 5.7.10.

*How can one view which TLS versions are in active use?* For MySQL 5.7 or 8.0, review whether TLS 1.0 or 1.1 is in use by running this query:

```
SELECT
 `session_ssl_status`.`thread_id`, `session_ssl_status`.`ssl_version`,
 `session_ssl_status`.`ssl_cipher`, `session_ssl_status`.`ssl_sessions_reused`
FROM `sys`.`session_ssl_status`
WHERE ssl_version NOT IN ('TLSv1.3', 'TLSv1.2');
```

If a thread using TLSv1.0 or TLSv1.1 is listed, you can determine where this connection is coming from by running this query:

```
SELECT thd_id, conn_id, user, db, current_statement, program_name
FROM sys.processlist
WHERE thd_id IN (
 SELECT `session_ssl_status`.`thread_id`
 FROM `sys`.`session_ssl_status`
```

```
 WHERE ssl_version NOT IN ('TLSv1.3','TLSv1.2')
);
```

Alternatively, you can run this query:

```
SELECT *
FROM sys.session
WHERE thd_id IN (
 SELECT `session_ssl_status`.`thread_id`
 FROM `sys`.`session_ssl_status`
 WHERE ssl_version NOT IN ('TLSv1.3','TLSv1.2')
);
```

These queries provide details needed to determine which application is not supporting TLS 1.2 or 1.3, and target upgrades for those.

*Are there other options for testing for TLS 1.0 or 1.1?* Yes, you can disable those versions prior to upgrading your server to a newer version. Explicitly specify which version to use, either in `mysql.cnf` (or `mysql.ini`) or by using `SET PERSIST`, for example: `--tls-version=TLSv12`.

*Do all MySQL Connectors (5.7 and 8.0) support TLS 1.2 and higher? What about C and C++ applications using libmysql?* For C and C++ applications using the community `libmysqlclient` library, use an OpenSSL-based library (that is, do *not* use YaSSL). Usage of OpenSSL was unified in 2018 (in MySQL 8.0.4 and 5.7.28, respectively). The same applies for Connector/ODBC and Connector/C++. To determine what library dependencies are used, run the following commands to see if OpenSSL is listed. On Linux, use this command:

```
$> sudo ldd /usr/local/mysql/lib/libmysqlclient.a | grep -i openssl
```

On MacOS, use this command:

```
$> sudo otool -l /usr/local/mysql/lib/libmysqlclient.a | grep -i openssl
```

Check the documentation for each connector, but they do support TLS 1.2 and TLS 1.3.

## A.10 MySQL 8.4 FAQ: NDB Cluster

In the following section, we answer questions that are frequently asked about MySQL NDB Cluster and the `NDB` storage engine.

A.10.1 Which versions of the MySQL software support NDB Cluster? Do I have to compile from source? .....	5117
A.10.2 What do “NDB” and “NDBCLUSTER” mean? .....	5118
A.10.3 What is the difference between using NDB Cluster versus using MySQL Replication? .....	5118
A.10.4 Do I need any special networking to run NDB Cluster? How do computers in a cluster communicate? .....	5118

**A.10.1** Which versions of the MySQL software support NDB Cluster? Do I have to compile from source?

NDB Cluster is not supported in standard MySQL Server releases. Instead, MySQL NDB Cluster is provided as a separate product. Available NDB Cluster release series include the following:

- **NDB Cluster 7.3 / NDB Cluster 7.4.** These two series are no longer maintained or supported for new deployments. Users of NDB Cluster 7.3 or 7.4 should upgrade to NDB 7.5 or newer as soon as possible. We recommend that new deployments use the latest NDB Cluster 8.0 release.
- **NDB Cluster 7.5.** This series is a previous General Availability (GA) version of NDB Cluster, still available for production use, although we recommend that new deployments use the latest NDB Cluster 8.0 release. The latest NDB Cluster 7.5 releases can be obtained from <https://dev.mysql.com/downloads/cluster/>.
- **NDB Cluster 7.6.** This series is a previous General Availability (GA) version of NDB Cluster, still available for production use, although we recommend that new deployments use the latest NDB Cluster 8.0 release. The latest NDB Cluster 7.6 releases can be obtained from <https://dev.mysql.com/downloads/cluster/>.
- **NDB Cluster 8.0.** This series is the most recent General Availability (GA) version of NDB Cluster, based on version 8.0 of the `NDB` storage engine and MySQL Server 8.0. NDB Cluster 8.0 is available for production use; new deployments intended for production should use the latest GA release in this series, which is currently NDB Cluster 8.0.42. You can obtain the most recent NDB Cluster 8.0 release from <https://dev.mysql.com/downloads/cluster/>. For information about new features and other important changes in this series, see [What is New in MySQL NDB Cluster 8.0](#).

You can obtain and compile NDB Cluster from source (see [Section 25.3.1.4, “Building NDB Cluster from Source on Linux”](#), and [Section 25.3.2.2, “Compiling and Installing NDB Cluster from Source on Windows”](#)), but for all but the most specialized cases, we recommend using one of the following installers provided by Oracle that is appropriate to your operating platform and circumstances:

- Linux [binary release](#) (`.tar.gz` file)
- Linux [RPM package](#)
- Linux [.deb file](#)
- Windows [binary “no-install” release](#)
- Windows [MSI Installer](#)

Installation packages may also be available from your platform's package management system.

You can determine whether your MySQL Server has `NDB` support using one of the statements `SHOW VARIABLES LIKE 'have_%'`, `SHOW ENGINES`, or `SHOW PLUGINS`.

#### A.10.2 What do “NDB” and “NDBCLUSTER” mean?

“NDB” stands for “**N**etwork **D**atabase”. `NDB` and `NDBCLUSTER` are both names for the storage engine that enables clustering support with MySQL. `NDB` is preferred, but either name is correct.

#### A.10.3 What is the difference between using NDB Cluster versus using MySQL Replication?

In traditional MySQL replication, a source MySQL server updates one or more replicas. Transactions are committed sequentially, and a slow transaction can cause the replica to lag behind the source. This means that if the source fails, it is possible that the replica might not have recorded the last few transactions. If a transaction-safe engine such as `InnoDB` is being used, a transaction is either completed on the replica or not applied at all, but replication does not guarantee that all data on the source and the replica remains consistent at all times. In NDB Cluster, all data nodes are kept in synchrony, and a transaction committed by any one data node is committed for all data nodes. In the event of a data node failure, all remaining data nodes remain in a consistent state.

In short, whereas standard MySQL replication is *asynchronous*, NDB Cluster is *synchronous*.

Asynchronous replication is also available in NDB Cluster. *NDB Cluster Replication* (also sometimes known as “geo-replication”) includes the capability to replicate both between two NDB Clusters, and from an NDB Cluster to a non-Cluster MySQL server. See [Section 25.7, “NDB Cluster Replication”](#).

#### A.10.4 Do I need any special networking to run NDB Cluster? How do computers in a cluster communicate?

NDB Cluster is intended to be used in a high-bandwidth environment, with computers connecting using TCP/IP. Its performance depends directly upon the connection speed between the cluster's computers. The minimum connectivity requirements for NDB Cluster include a typical 100-megabit Ethernet network or the equivalent. We recommend you use gigabit Ethernet whenever available.

#### A.10.5 How many computers do I need to run an NDB Cluster, and why?

A minimum of three computers is required to run a viable cluster. However, the minimum *recommended* number of computers in an NDB Cluster is four: one each to run the management and SQL nodes, and two computers to serve as data nodes. The purpose of the two data nodes is to provide redundancy; the management node must run on a separate machine to guarantee continued arbitration services in the event that one of the data nodes fails.

To provide increased throughput and high availability, you should use multiple SQL nodes (MySQL Servers connected to the cluster). It is also possible (although not strictly necessary) to run multiple management servers.

#### A.10.6 What do the different computers do in an NDB Cluster?

An NDB Cluster has both a physical and logical organization, with computers being the physical elements. The logical or functional elements of a cluster are referred to as *nodes*, and a computer housing a cluster node is sometimes referred to as a *cluster host*. There are three types of nodes, each corresponding to a specific role within the cluster. These are:

- **Management node.** This node provides management services for the cluster as a whole, including startup, shutdown, backups, and configuration data for the other nodes. The management node server is implemented as the application `ndb_mgmd`; the management client used to control NDB Cluster is `ndb_mgm`. See [Section 25.5.4, “ndb\\_mgmd — The NDB Cluster Management Server Daemon”](#), and [Section 25.5.5, “ndb\\_mgm — The NDB Cluster Management Client”](#), for information about these programs.
- **Data node.** This type of node stores and replicates data. Data node functionality is handled by instances of the NDB data node process `ndbd`. For more information, see [Section 25.5.1, “ndbd — The NDB Cluster Data Node Daemon”](#).
- **SQL node.** This is simply an instance of MySQL Server (`mysqld`) that is built with support for the NDBCLUSTER storage engine and started with the `--ndb-cluster` option to enable the engine and the `--ndb-connectstring` option to enable it to connect to an NDB Cluster management server. For more about these options, see [MySQL Server Options for NDB Cluster](#).

#### Note

An *API node* is any application that makes direct use of Cluster data nodes for data storage and retrieval. An SQL node can thus be considered a type of API node that uses a MySQL Server to provide an SQL interface to the Cluster. You can write such applications (that do not depend on a MySQL Server) using the NDB API, which supplies a direct, object-oriented transaction and scanning interface to NDB Cluster data; see [NDB Cluster API Overview: The NDB API](#), for more information.

#### A.10.7 When I run the `SHOW` command in the NDB Cluster management client, I see a line of output that looks like this:

```
id=2 @10.100.10.32 (Version: 8.0.42-ndb-8.0.42 Nodegroup: 0, *)
```

What does the `*` mean? How is this node different from the others?

The simplest answer is, “It’s not something you can control, and it’s nothing that you need to worry about in any case, unless you’re a software engineer writing or analyzing the NDB Cluster source code”.

If you don’t find that answer satisfactory, here’s a longer and more technical version:

A number of mechanisms in NDB Cluster require distributed coordination among the data nodes. These distributed algorithms and protocols include global checkpointing, DDL (schema) changes, and node restart handling. To make this coordination simpler, the data nodes “elect” one of their number to act as leader. There is no user-facing mechanism for influencing this selection, which is completely automatic; the fact that it *is* automatic is a key part of NDB Cluster’s internal architecture.

When a node acts as the “leader” for any of these mechanisms, it is usually the point of coordination for the activity, and the other nodes act as “followers”, carrying out their parts of the activity as directed by the leader. If the node acting as leader fails, then the remaining nodes elect a new leader. Tasks in progress that were being coordinated by the old leader may either fail or be continued by the new leader, depending on the actual mechanism involved.

It is possible for some of these different mechanisms and protocols to have different leader nodes, but in general the same leader is chosen for all of them. The node indicated as the leader in the output of `SHOW` in the management client is known internally as the `DICT` manager, responsible for coordinating DDL and metadata activity.

NDB Cluster is designed in such a way that the choice of leader has no discernible effect outside the cluster itself. For example, the current leader does not have significantly higher CPU or resource usage than the other data nodes, and failure of the leader should not have a significantly different impact on the cluster than the failure of any other data node.

#### A.10.8 With which operating systems can I use NDB Cluster?

NDB Cluster is supported on most Unix-like operating systems. NDB Cluster is also supported in production settings on Microsoft Windows operating systems.

For more detailed information concerning the level of support which is offered for NDB Cluster on various operating system versions, operating system distributions, and hardware platforms, please refer to <https://www.mysql.com/support/supportedplatforms/cluster.html>.

#### A.10.9 What are the hardware requirements for running NDB Cluster?

NDB Cluster should run on any platform for which `NDB`-enabled binaries are available. For data nodes and API nodes, faster CPUs and more memory are likely to improve performance, and 64-bit CPUs are likely to be more effective than 32-bit processors. There must be sufficient memory on machines used for data nodes to hold each node's share of the database (see *How much RAM do I Need?* for more information). For a computer which is used only for running the NDB Cluster management server, the requirements are minimal; a common desktop PC (or the equivalent) is generally sufficient for this task. Nodes can communicate through the standard TCP/IP network and hardware. They can also use the high-speed SCI protocol; however, special networking hardware and software are required to use SCI (see [Section 25.4.4, “Using High-Speed Interconnects with NDB Cluster”](#)).

#### A.10.10 How much RAM do I need to use NDB Cluster? Is it possible to use disk memory at all?

NDB Cluster was originally implemented as in-memory only, but all versions currently available also provide the ability to store NDB Cluster on disk. See [Section 25.6.11, “NDB Cluster Disk Data Tables”](#), for more information.

For in-memory `NDB` tables, you can use the following formula for obtaining a rough estimate of how much RAM is needed for each data node in the cluster:

```
(SizeofDatabase × NumberOfReplicas × 1.1) / NumberOfDataNodes
```

To calculate the memory requirements more exactly requires determining, for each table in the cluster database, the storage space required per row (see [Section 13.7, “Data Type Storage Requirements”](#), for details), and multiplying this by the number of rows. You must also remember to account for any column indexes as follows:

- Each primary key or hash index created for an `NDBCCLUSTER` table requires 21–25 bytes per record. These indexes use `IndexMemory`.
- Each ordered index requires 10 bytes storage per record, using `DataMemory`.
- Creating a primary key or unique index also creates an ordered index, unless this index is created with `USING HASH`. In other words:

- A primary key or unique index on a Cluster table normally takes up 31 to 35 bytes per record.
- However, if the primary key or unique index is created with `USING HASH`, then it requires only 21 to 25 bytes per record.

Creating NDB Cluster tables with `USING HASH` for all primary keys and unique indexes generally causes table updates to run more quickly—in some cases by as much as 20 to 30 percent faster than updates on tables where `USING HASH` was not used in creating primary and unique keys. This is due to the fact that less memory is required (because no ordered indexes are created), and that less CPU must be utilized (because fewer indexes must be read and possibly updated). However, it also means that queries that could otherwise use range scans must be satisfied by other means, which can result in slower selects.

When calculating Cluster memory requirements, you may find useful the `ndb_size.pl` utility which is available in recent MySQL 8.4 releases. This Perl script connects to a current (non-Cluster) MySQL database and creates a report on how much space that database would require if it used the `NDBCLUSTER` storage engine. For more information, see [Section 25.5.29, “`ndb\_size.pl` — NDBCLUSTER Size Requirement Estimator”](#).

It is especially important to keep in mind that *every NDB Cluster table must have a primary key*. The `NDB` storage engine creates a primary key automatically if none is defined; this primary key is created without `USING HASH`.

You can determine how much memory is being used for storage of NDB Cluster data and indexes at any given time using the `REPORT MEMORYUSAGE` command in the `ndb_mgm` client; see [Section 25.6.1, “Commands in the NDB Cluster Management Client”](#), for more information. In addition, warnings are written to the cluster log when 80% of available `DataMemory` or (prior to NDB 7.6) `IndexMemory` is in use, and again when usage reaches 90%, 99%, and 100%.

#### A.10.1 What file systems can I use with NDB Cluster? What about network file systems or network shares?

Generally, any file system that is native to the host operating system should work well with NDB Cluster. If you find that a given file system works particularly well (or not so especially well) with NDB Cluster, we invite you to discuss your findings in the [NDB Cluster Forums](#).

For Windows, we recommend that you use `NTFS` file systems for NDB Cluster, just as we do for standard MySQL. We do not test NDB Cluster with `FAT` or `VFAT` file systems. Because of this, we do not recommend their use with MySQL or NDB Cluster.

NDB Cluster is implemented as a shared-nothing solution; the idea behind this is that the failure of a single piece of hardware should not cause the failure of multiple cluster nodes, or possibly even the failure of the cluster as a whole. For this reason, the use of network shares or network file systems is not supported for NDB Cluster. This also applies to shared storage devices such as SANs.

#### A.10.12 Can I run NDB Cluster nodes inside virtual machines (such as those created by VMWare, VirtualBox, Parallels, or Xen)?

NDB Cluster is supported for use in virtual machines. We currently support and test using [Oracle VM](#).

Some NDB Cluster users have successfully deployed NDB Cluster using other virtualization products; in such cases, Oracle can provide NDB Cluster support, but issues specific to the virtual environment must be referred to that product's vendor.

#### A.10.13 I am trying to populate an NDB Cluster database. The loading process terminates prematurely and I get an error message like this one:

```
ERROR 1114: The table 'my_cluster_table' is full
```

Why is this happening?

The cause is very likely to be that your setup does not provide sufficient RAM for all table data and all indexes, *including the primary key required by the NDB storage engine and automatically created in the event that the table definition does not include the definition of a primary key.*

It is also worth noting that all data nodes should have the same amount of RAM, since no data node in a cluster can use more memory than the least amount available to any individual data node. For example, if there are four computers hosting Cluster data nodes, and three of these have 3GB of RAM available to store Cluster data while the remaining data node has only 1GB RAM, then each data node can devote at most 1GB to NDB Cluster data and indexes.

In some cases it is possible to get `Table is full` errors in MySQL client applications even when `ndb_mgm -e "ALL REPORT MEMORYUSAGE"` shows significant free `DataMemory`. You can force `NDB` to create extra partitions for NDB Cluster tables and thus have more memory available for hash indexes by using the `MAX_ROWS` option for `CREATE TABLE`. In general, setting `MAX_ROWS` to twice the number of rows that you expect to store in the table should be sufficient.

For similar reasons, you can also sometimes encounter problems with data node restarts on nodes that are heavily loaded with data. The `MinFreePct` parameter can help with this issue by reserving a portion (5% by default) of `DataMemory` and (prior to NDB 7.6) `IndexMemory` for use in restarts. This reserved memory is not available for storing `NDB` tables or data.

#### A.10.14 NDB Cluster uses TCP/IP. Does this mean that I can run it over the Internet, with one or more nodes in remote locations?

It is very unlikely that a cluster would perform reliably under such conditions, as NDB Cluster was designed and implemented with the assumption that it would be run under conditions guaranteeing dedicated high-speed connectivity such as that found in a LAN setting using 100 Mbps or gigabit Ethernet—preferably the latter. We neither test nor warrant its performance using anything slower than this.

Also, it is extremely important to keep in mind that communications between the nodes in an NDB Cluster are not secure; they are neither encrypted nor safeguarded by any other protective mechanism. The most secure configuration for a cluster is in a private network behind a firewall, with no direct access to any Cluster data or management nodes from outside. (For SQL nodes, you should take the same precautions as you would with any other instance of the MySQL server.) For more information, see [Section 25.6.19, “NDB Cluster Security”](#).

#### A.10.15 Do I have to learn a new programming or query language to use NDB Cluster?

No. Although some specialized commands are used to manage and configure the cluster itself, only standard (My)SQL statements are required for the following operations:

- Creating, altering, and dropping tables
- Inserting, updating, and deleting table data
- Creating, changing, and dropping primary and unique indexes

Some specialized configuration parameters and files are required to set up an NDB Cluster—see [Section 25.4.3, “NDB Cluster Configuration Files”](#), for information about these.

A few simple commands are used in the NDB Cluster management client (`ndb_mgm`) for tasks such as starting and stopping cluster nodes. See [Section 25.6.1, “Commands in the NDB Cluster Management Client”](#).

**A.10.16** What programming languages and APIs are supported by NDB Cluster?

NDB Cluster supports the same programming APIs and languages as the standard MySQL Server, including ODBC, .Net, the MySQL C API, and numerous drivers for popular scripting languages such as PHP, Perl, and Python. NDB Cluster applications written using these APIs behave similarly to other MySQL applications; they transmit SQL statements to a MySQL Server (in the case of NDB Cluster, an SQL node), and receive responses containing rows of data. For more information about these APIs, see [Chapter 31, Connectors and APIs](#).

NDB Cluster also supports application programming using the NDB API, which provides a low-level C++ interface to NDB Cluster data without needing to go through a MySQL Server. See [The NDB API](#). In addition, many `NDBCLUSTER` management functions are exposed by the C-language MGM API; see [The MGM API](#), for more information.

NDB Cluster also supports Java application programming using ClusterJ, which supports a domain object model of data using sessions and transactions. See [Java and NDB Cluster](#), for more information.

NDB Cluster 8.0 also includes adapters supporting NoSQL applications written against `Node.js`, with NDB Cluster as the data store. See [MySQL NoSQL Connector for JavaScript](#), for more information.

**A.10.17** Does NDB Cluster include any management tools?

NDB Cluster includes a command line client for performing basic management functions. See [Section 25.5.5, “ndb\\_mgm — The NDB Cluster Management Client”](#), and [Section 25.6.1, “Commands in the NDB Cluster Management Client”](#).

NDB Cluster is also supported by MySQL Cluster Manager, a separate product providing an advanced command line interface that can automate many NDB Cluster management tasks such as rolling restarts and configuration changes. For more information about MySQL Cluster Manager, see [MySQL Cluster Manager 8.4.6 User Manual](#).

**A.10.18** How do I find out what an error or warning message means when using NDB Cluster?

There are two ways in which this can be done:

- From within the `mysql` client, use `SHOW ERRORS` or `SHOW WARNINGS` immediately upon being notified of the error or warning condition.
- From a system shell prompt, use `perror --ndb error_code`.

**A.10.19** Is NDB Cluster transaction-safe? What isolation levels are supported?

Yes. For tables created with the `NDB` storage engine, transactions are supported. Currently, NDB Cluster supports only the `READ COMMITTED` transaction isolation level.

**A.10.20** What storage engines are supported by NDB Cluster?

NDB Cluster requires the `NDB` storage engine. That is, in order for a table to be shared between nodes in an NDB Cluster, the table must be created using `ENGINE=NDB` (or the equivalent option `ENGINE=NDCLUSTER`).

It is possible to create tables using other storage engines (such as `InnoDB` or `MyISAM`) on a MySQL server being used with NDB Cluster, but since these tables do not use `NDB`, they do not participate in clustering; each such table is strictly local to the individual MySQL server instance on which it is created.

NDB Cluster is quite different from `InnoDB` clustering with regard to architecture, requirements, and implementation; despite any similarity in their names, the two are not compatible. For more information about `InnoDB` clustering, see [MySQL AdminAPI](#). See also [Section 25.2.6, “MySQL](#)

[Server Using InnoDB Compared with NDB Cluster](#)”, for information about the differences between the `NDB` and `InnoDB` storage engines.

**A.10.21** In the event of a catastrophic failure—for example, the whole city loses power *and* my UPS fails—would I lose all my data?

All committed transactions are logged. Therefore, although it is possible that some data could be lost in the event of a catastrophe, this should be quite limited. Data loss can be further reduced by minimizing the number of operations per transaction. (It is not a good idea to perform large numbers of operations per transaction in any case.)

**A.10.22** Is it possible to use `FULLTEXT` indexes with NDB Cluster?

`FULLTEXT` indexing is currently supported only by the `InnoDB` and `MyISAM` storage engines. See [Section 14.9, “Full-Text Search Functions”](#), for more information.

**A.10.23** Can I run multiple nodes on a single computer?

It is possible but not always advisable. One of the chief reasons to run a cluster is to provide redundancy. To obtain the full benefits of this redundancy, each node should reside on a separate machine. If you place multiple nodes on a single machine and that machine fails, you lose all of those nodes. For this reason, if you do run multiple data nodes on a single machine, it is *extremely* important that they be set up in such a way that the failure of this machine does not cause the loss of all the data nodes in a given node group.

Given that NDB Cluster can be run on commodity hardware loaded with a low-cost (or even no-cost) operating system, the expense of an extra machine or two is well worth it to safeguard mission-critical data. It also worth noting that the requirements for a cluster host running a management node are minimal. This task can be accomplished with a 300 MHz Pentium or equivalent CPU and sufficient RAM for the operating system, plus a small amount of overhead for the `ndb_mgmd` and `ndb_mgm` processes.

It is acceptable to run multiple cluster data nodes on a single host that has multiple CPUs, cores, or both. The NDB Cluster distribution also provides a multithreaded version of the data node binary intended for use on such systems. For more information, see [Section 25.5.3, “ndbmtd — The NDB Cluster Data Node Daemon \(Multi-Threaded\)”](#).

It is also possible in some cases to run data nodes and SQL nodes concurrently on the same machine; how well such an arrangement performs is dependent on a number of factors such as number of cores and CPUs as well as the amount of disk and memory available to the data node and SQL node processes, and you must take these factors into account when planning such a configuration.

**A.10.24** Can I add data nodes to an NDB Cluster without restarting it?

It is possible to add new data nodes to a running NDB Cluster without taking the cluster offline. For more information, see [Section 25.6.7, “Adding NDB Cluster Data Nodes Online”](#).

For other types of NDB Cluster nodes, a rolling restart is all that is required (see [Section 25.6.5, “Performing a Rolling Restart of an NDB Cluster”](#)).

**A.10.25** Are there any limitations that I should be aware of when using NDB Cluster?

Limitations on `NDB` tables in MySQL NDB Cluster include the following:

- Temporary tables are not supported; a `CREATE TEMPORARY TABLE` statement using `ENGINE=NDB` or `ENGINE=NDCLUSTER` fails with an error.
- The only types of user-defined partitioning supported for `NDCLUSTER` tables are `KEY` and `LINEAR KEY`. Trying to create an `NDB` table using any other partitioning type fails with an error.

- `FULLTEXT` indexes are not supported.
- Index prefixes are not supported. Only complete columns may be indexed.
- Spatial indexes are not supported (although spatial columns can be used). See [Section 13.4, “Spatial Data Types”](#).
- Support for partial transactions and partial rollbacks is comparable to that of other transactional storage engines such as `InnoDB` that can roll back individual statements.
- The maximum number of attributes allowed per table is 512. Attribute names cannot be any longer than 31 characters. For each table, the maximum combined length of the table and database names is 122 characters.
- Prior to NDB 8.0, the maximum size for a table row is 14 kilobytes, not counting `BLOB` values. In NDB 8.0, this maximum is increased to 30000 bytes. See [Section 25.2.7.5, “Limits Associated with Database Objects in NDB Cluster”](#), for more information.

There is no set limit for the number of rows per `NDB` table. Limits on table size depend on a number of factors, in particular on the amount of RAM available to each data node.

For a complete listing of limitations in NDB Cluster, see [Section 25.2.7, “Known Limitations of NDB Cluster”](#). See also [Section 25.2.7.11, “Previous NDB Cluster Issues Resolved in NDB Cluster 8.4”](#).

#### A.10.26 Does NDB Cluster support foreign keys?

NDB Cluster provides support for foreign key constraints which is comparable to that found in the `InnoDB` storage engine; see [Section 1.7.3.2, “FOREIGN KEY Constraints”](#), for more detailed information, as well as [Section 15.1.20.5, “FOREIGN KEY Constraints”](#). Applications requiring foreign key support should use NDB Cluster 7.3, 7.4, 7.5, or later.

#### A.10.27 How do I import an existing MySQL database into an NDB Cluster?

You can import databases into NDB Cluster much as you would with any other version of MySQL. Other than the limitations mentioned elsewhere in this FAQ, the only other special requirement is that any tables to be included in the cluster must use the `NDB` storage engine. This means that the tables must be created with `ENGINE=NDB` or `ENGINE=NDBCLUSTER`.

It is also possible to convert existing tables that use other storage engines to `NDBCLUSTER` using one or more `ALTER TABLE` statement. However, the definition of the table must be compatible with the `NDBCLUSTER` storage engine prior to making the conversion. In MySQL 8.4, an additional workaround is also required; see [Section 25.2.7, “Known Limitations of NDB Cluster”](#), for details.

#### A.10.28 How do NDB Cluster nodes communicate with one another?

Cluster nodes can communicate through any of three different transport mechanisms: TCP/IP, SHM (shared memory), and SCI (Scalable Coherent Interface). Where available, SHM is used by default between nodes residing on the same cluster host; however, this is considered experimental. SCI is a high-speed (1 gigabit per second and higher), high-availability protocol used in building scalable multi-processor systems; it requires special hardware and drivers. See [Section 25.4.4, “Using High-Speed Interconnects with NDB Cluster”](#), for more about using SCI as a transport mechanism for NDB Cluster.

#### A.10.29 What is an *arbitrator*?

If one or more data nodes in a cluster fail, it is possible that not all cluster data nodes are able to “see” one another. In fact, it is possible that two sets of data nodes might become isolated from one another in a network partitioning, also known as a “split-brain” scenario. This type of

situation is undesirable because each set of data nodes tries to behave as though it is the entire cluster. An arbitrator is required to decide between the competing sets of data nodes.

When all data nodes in at least one node group are alive, network partitioning is not an issue, because no single subset of the cluster can form a functional cluster on its own. The real problem arises when no single node group has all its nodes alive, in which case network partitioning (the “split-brain” scenario) becomes possible. Then an arbitrator is required. All cluster nodes recognize the same node as the arbitrator, which is normally the management server; however, it is possible to configure any of the MySQL Servers in the cluster to act as the arbitrator instead. The arbitrator accepts the first set of cluster nodes to contact it, and tells the remaining set to shut down. Arbitrator selection is controlled by the [ArbitrationRank](#) configuration parameter for MySQL Server and management server nodes. You can also use the [ArbitrationRank](#) configuration parameter to control the arbitrator selection process. For more information about these parameters, see [Section 25.4.3.5, “Defining an NDB Cluster Management Server”](#).

The role of arbitrator does not in and of itself impose any heavy demands upon the host so designated, and thus the arbitrator host does not need to be particularly fast or to have extra memory especially for this purpose.

#### A.10.30 What data types are supported by NDB Cluster?

NDB Cluster supports all of the usual MySQL data types, including those associated with MySQL's spatial extensions; however, the [NDB](#) storage engine does not support spatial indexes. (Spatial indexes are supported only by [MyISAM](#); see [Section 13.4, “Spatial Data Types”](#), for more information.) In addition, there are some differences with regard to indexes when used with [NDB](#) tables.

##### Note

NDB Cluster Disk Data tables (that is, tables created with `TABLESPACE ... STORAGE DISK ENGINE=NDB` or `TABLESPACE ... STORAGE DISK ENGINE=NDCLUSTER`) have only fixed-width rows. This means that (for example) each Disk Data table record containing a `VARCHAR(255)` column requires space for 255 characters (as required for the character set and collation being used for the table), regardless of the actual number of characters stored therein.

See [Section 25.2.7, “Known Limitations of NDB Cluster”](#), for more information about these issues.

#### A.10.31 How do I start and stop NDB Cluster?

It is necessary to start each node in the cluster separately, in the following order:

1. Start the management node, using the `ndb_mgmd` command.

When starting the cluster for the first time, you must include the `-f` or `--config-file` option to tell the management node where its configuration file can be found.

2. Start each data node with the `ndbd` command.

Each data node must be started with the `-c` or `--ndb-connectstring` option so that the data node knows how to connect to the management server.

3. Start each MySQL Server (SQL node) using your preferred startup script, such as `mysqld_safe`.

Each MySQL Server must be started with the `--ndbcluster` and `--ndb-connectstring` options. These options cause `mysqld` to enable [NDCLUSTER](#) storage engine support and how to connect to the management server.

Each of these commands must be run from a system shell on the machine housing the affected node. (You do not have to be physically present at the machine—a remote login shell can be used for this purpose.) You can verify that the cluster is running by starting the [NDB](#) management client `ndb_mgm` on the machine housing the management node and issuing the `SHOW` or `ALL STATUS` command.

To shut down a running cluster, issue the command `SHUTDOWN` in the management client. Alternatively, you may enter the following command in a system shell:

```
$> ndb_mgm -e "SHUTDOWN"
```

(The quotation marks in this example are optional, since there are no spaces in the command string following the `-e` option; in addition, the `SHUTDOWN` command, like other management client commands, is not case-sensitive.)

Either of these commands causes the `ndb_mgm`, `ndb_mgm`, and any `ndbd` processes to terminate gracefully. MySQL servers running as SQL nodes can be stopped using `mysqladmin shutdown`.

For more information, see [Section 25.6.1, “Commands in the NDB Cluster Management Client”](#), and [Section 25.3.6, “Safe Shutdown and Restart of NDB Cluster”](#).

MySQL Cluster Manager provides additional ways to handle starting and stopping of NDB Cluster nodes. See [MySQL Cluster Manager 8.4.6 User Manual](#), for more information about this tool.

#### A.10.32 What happens to NDB Cluster data when the cluster is shut down?

The data that was held in memory by the cluster's data nodes is written to disk, and is reloaded into memory the next time that the cluster is started.

#### A.10.33 Is it a good idea to have more than one management node for an NDB Cluster?

It can be helpful as a fail-safe. Only one management node controls the cluster at any given time, but it is possible to configure one management node as primary, and one or more additional management nodes to take over in the event that the primary management node fails.

See [Section 25.4.3, “NDB Cluster Configuration Files”](#), for information on how to configure NDB Cluster management nodes.

#### A.10.34 Can I mix different kinds of hardware and operating systems in one NDB Cluster?

Yes, as long as all machines and operating systems have the same “endianness” (all big-endian or all little-endian).

It is also possible to use software from different NDB Cluster releases on different nodes. However, we support such use only as part of a rolling upgrade procedure (see [Section 25.6.5, “Performing a Rolling Restart of an NDB Cluster”](#)).

#### A.10.35 Can I run two data nodes on a single host? Two SQL nodes?

Yes, it is possible to do this. In the case of multiple data nodes, it is advisable (but not required) for each node to use a different data directory. If you want to run multiple SQL nodes on one machine, each instance of `mysqld` must use a different TCP/IP port.

Running data nodes and SQL nodes together on the same host is possible, but you should be aware that the `ndbd` or `ndbmt` processes may compete for memory with `mysqld`.

#### A.10.36 Can I use host names with NDB Cluster?

Yes, it is possible to use DNS and DHCP for cluster hosts. However, if your application requires “five nines” availability, you should use fixed (numeric) IP addresses, since making

communication between Cluster hosts dependent on services such as DNS and DHCP introduces additional potential points of failure.

#### A.10.3 Does NDB Cluster support IPv6?

All types of NDB Cluster nodes support IPv6; this includes management nodes, data nodes, and API or SQL nodes.

#### A.10.38 How do I handle MySQL users in an NDB Cluster having multiple MySQL servers?

MySQL user accounts and privileges are normally not automatically propagated between different MySQL servers accessing the same NDB Cluster. MySQL NDB Cluster provides support for shared and synchronized users and privileges using the [NDB\\_STORED\\_USER](#) privilege; see [Distributed Privileges Using Shared Grant Tables](#), for more information. You should be aware that this implementation was introduced in NDB 8.0, and is not compatible with the shared privileges mechanism employed in earlier versions of NDB Cluster. The older implementation is no longer supported in NDB 8.0.

#### A.10.39 How do I continue to send queries in the event that one of the SQL nodes fails?

MySQL NDB Cluster does not provide any sort of automatic failover between SQL nodes. Your application must be prepared to handle the loss of SQL nodes and to fail over between them.

#### A.10.40 How do I back up and restore an NDB Cluster?

You can use the NDB Cluster native backup and restore functionality in the NDB management client and the [ndb\\_restore](#) program. See [Section 25.6.8, “Online Backup of NDB Cluster”](#), and [Section 25.5.23, “ndb\\_restore — Restore an NDB Cluster Backup”](#).

You can also use the traditional functionality provided for this purpose in [mysqldump](#) and the MySQL server. See [Section 6.5.4, “mysqldump — A Database Backup Program”](#), for more information.

#### A.10.41 What is an “angel process”?

This process monitors and, if necessary, attempts to restart the data node process. If you check the list of active processes on your system after starting [ndbd](#), you can see that there are actually 2 processes running by that name, as shown here (we omit the output from [ndb\\_mgmd](#) and [ndbd](#) for brevity):

```
$> ./ndb_mgmd
$> ps aux | grep ndb
me 23002 0.0 0.0 122948 3104 ? Ssl 14:14 0:00 ./ndb_mgmd
me 23025 0.0 0.0 5284 820 pts/2 S+ 14:14 0:00 grep ndb

$> ./ndbd -c 127.0.0.1 --initial
$> ps aux | grep ndb
me 23002 0.0 0.0 123080 3356 ? Ssl 14:14 0:00 ./ndb_mgmd
me 23096 0.0 0.0 35876 2036 ? Ss 14:14 0:00 ./ndbmttd -c 127.0.0.1 --initial
me 23097 1.0 2.4 524116 91096 ? S1 14:14 0:00 ./ndbmttd -c 127.0.0.1 --initial
me 23168 0.0 0.0 5284 812 pts/2 R+ 14:15 0:00 grep ndb
```

The [ndbd](#) process showing `0.0` for both memory and CPU usage is the angel process (although it actually does use a very small amount of each). This process merely checks to see if the main [ndbd](#) or [ndbmttd](#) process (the primary data node process which actually handles the data) is running. If permitted to do so (for example, if the [StopOnError](#) configuration parameter is set to `false`), the angel process tries to restart the primary data node process.

## A.11 MySQL 8.4 FAQ: MySQL Chinese, Japanese, and Korean Character Sets

---

This set of Frequently Asked Questions derives from the experience of MySQL's Support and Development groups in handling many inquiries about CJK (Chinese-Japanese-Korean) issues.

A.11.1 What CJK character sets are available in MySQL? .....	5129
A.11.2 I have inserted CJK characters into my table. Why does <code>SELECT</code> display them as "?" characters? .....	5130
A.11.3 What problems should I be aware of when working with the Big5 Chinese character set? ..	5132
A.11.4 Why do Japanese character set conversions fail? .....	5132
A.11.5 What should I do if I want to convert SJIS 81CA to cp932? .....	5133
A.11.6 How does MySQL represent the Yen (¥) sign? .....	5133
A.11.7 Of what issues should I be aware when working with Korean character sets in MySQL? ....	5133
A.11.8 Why do I get <code>Incorrect string value</code> error messages? .....	5134
A.11.9 Why does my GUI front end or browser display CJK characters incorrectly in my application using Access, PHP, or another API? .....	5134
A.11.10 I've upgraded to MySQL 8.4. How can I revert to behavior like that in MySQL 4.0 with regard to character sets? .....	5135
A.11.11 Why do some <code>LIKE</code> and <code>FULLTEXT</code> searches with CJK characters fail? .....	5136
A.11.12 How do I know whether character <code>X</code> is available in all character sets? .....	5137
A.11.13 Why do CJK strings sort incorrectly in Unicode? (I) .....	5138
A.11.14 Why do CJK strings sort incorrectly in Unicode? (II) .....	5138
A.11.15 Why are my supplementary characters rejected by MySQL? .....	5138
A.11.16 Should "CJK" be "CJKV"? .....	5138
A.11.17 Does MySQL permit CJK characters to be used in database and table names? .....	5138
A.11.18 Where can I find translations of the MySQL Manual into Chinese, Japanese, and Korean? .....	5139
A.11.19 Where can I get help with CJK and related issues in MySQL? .....	5139

### A.11.1 What CJK character sets are available in MySQL?

The list of CJK character sets may vary depending on your MySQL version. For example, the `gb18030` character set is not supported prior to MySQL 5.7.4. However, since the name of the applicable language appears in the `DESCRIPTION` column for every entry in the `INFORMATION_SCHEMA.CHARACTER_SETS` table, you can obtain a current list of all the non-Unicode CJK character sets using this query:

```
mysql> SELECT CHARACTER_SET_NAME, DESCRIPTION
 FROM INFORMATION_SCHEMA.CHARACTER_SETS
 WHERE DESCRIPTION LIKE '%Chin%'
 OR DESCRIPTION LIKE '%Japanese%'
 OR DESCRIPTION LIKE '%Korean%'
 ORDER BY CHARACTER_SET_NAME;
+-----+-----+
| CHARACTER_SET_NAME | DESCRIPTION |
+-----+-----+
| big5 | Big5 Traditional Chinese
| cp932 | SJIS for Windows Japanese
| eucjpm5 | UJIS for Windows Japanese
| euckr | EUC-KR Korean
| gb18030 | China National Standard GB18030
| gb2312 | GB2312 Simplified Chinese
| gbk | GBK Simplified Chinese
| sjis | Shift-JIS Japanese
| ujis | EUC-JP Japanese
+-----+-----+
```

(For more information, see [Section 28.3.4, “The INFORMATION\\_SCHEMA CHARACTER\\_SETS Table”](#).)

MySQL supports three variants of the *GB* (*Guojia Biao zhun*, or *National Standard*, or *Simplified Chinese*) character sets which are official in the People's Republic of China: `gb2312`, `gbk`, and (as of MySQL 5.7.4) `gb18030`.

Sometimes people try to insert `gbk` characters into `gb2312`, and it works most of the time because `gbk` is a superset of `gb2312`. But eventually they try to insert a rarer Chinese character and it does not work. (For an example, see Bug #16072).

Here, we try to clarify exactly what characters are legitimate in `gb2312` or `gbk`, with reference to the official documents. Please check these references before reporting `gb2312` or `gbk` bugs:

- The MySQL `gbk` character set is in reality “Microsoft code page 936”. This differs from the official `gbk` for characters `A1A4` (middle dot), `A1AA` (em dash), `A6E0-A6F5`, and `A8BB-A8C0`.
- For a listing of `gbk`/Unicode mappings, see <http://www.unicode.org/Public/MAPPINGS/VENDORS/MICSFT/WINDOWS/CP936.TXT>.

It is also possible to store CJK characters in Unicode character sets, although the available collations may not sort characters quite as you expect:

- The `utf8` and `ucs2` character sets support the characters from Unicode Basic Multilingual Plane (BMP). These characters have code point values between `U+0000` and `U+FFFF`.
- The `utf8mb4`, `utf16`, `utf16le`, and `utf32` character sets support BMP characters, as well as supplementary characters that lie outside the BMP. Supplementary characters have code point values between `U+10000` and `U+10FFFF`.

The collation used for a Unicode character set determines the ability to sort (that is, distinguish) characters in the set:

- Collations based on Unicode Collation Algorithm (UCA) 4.0.0 distinguish only BMP characters.
- Collations based on UCA 5.2.0 or 9.0.0 distinguish BMP and supplementary characters.
- Non-UCA collations may not distinguish all Unicode characters. For example, the `utf8mb4` default collation is `utf8mb4_general_ci`, which distinguishes only BMP characters.

Moreover, distinguishing characters is not the same as ordering them per the conventions of a given CJK language. Currently, MySQL has only one CJK-specific UCA collation, `gb18030_unicode_520_ci` (which requires use of the non-Unicode `gb18030` character set).

For information about Unicode collations and their differentiating properties, including collation properties for supplementary characters, see [Section 12.10.1, “Unicode Character Sets”](#).

#### A.11.2 I have inserted CJK characters into my table. Why does `SELECT` display them as “?” characters?

This problem is usually due to a setting in MySQL that does not match the settings for the application program or the operating system. Here are some common steps for correcting these types of issues:

- *Be certain of what MySQL version you are using.*

Use the statement `SELECT VERSION()`; to determine this.

- *Make sure that the database is actually using the desired character set.*

People often think that the client character set is always the same as either the server character set or the character set used for display purposes. However, both of these are false assumptions. You can make sure by checking the result of `SHOW CREATE TABLE tablename` or, better yet, by using this statement:

```
SELECT character_set_name, collation_name
 FROM information_schema.columns
 WHERE table_schema = your_database_name
```

```
AND table_name = your_table_name
AND column_name = your_column_name;
```

- Determine the hexadecimal value of the character or characters that are not being displayed correctly.

You can obtain this information for a column `column_name` in the table `table_name` using the following query:

```
SELECT HEX(column_name)
FROM table_name;
```

`3F` is the encoding for the `?` character; this means that `?` is the character actually stored in the column. This most often happens because of a problem converting a particular character from your client character set to the target character set.

- Make sure that a round trip is possible. When you select `literal` (or `_introducer_hexadecimal-value`), do you obtain `literal` as a result?

For example, the Japanese Katakana character `Pe` (𠂊) exists in all CJK character sets, and has the code point value (hexadecimal coding) `0x30da`. To test a round trip for this character, use this query:

```
SELECT '𠂊' AS `𠂊`; /* or SELECT _ucs2 0x30da; */
```

If the result is not also `𠂊`, the round trip failed.

For bug reports regarding such failures, we might ask you to follow up with `SELECT HEX('𠂊');`. Then we can determine whether the client encoding is correct.

- Make sure that the problem is not with the browser or other application, rather than with MySQL.

Use the `mysql` client program to accomplish this task. If `mysql` displays characters correctly but your application does not, your problem is probably due to system settings.

To determine your settings, use the `SHOW VARIABLES` statement, whose output should resemble what is shown here:

```
mysql> SHOW VARIABLES LIKE 'char%';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| character_set_client | utf8 |
| character_set_connection | utf8 |
| character_set_database | latin1 |
| character_set_filesystem | binary |
| character_set_results | utf8 |
| character_set_server | latin1 |
| character_set_system | utf8 |
| character_sets_dir | /usr/local/mysql/share/mysql/charsets/ |
+-----+-----+
```

These are typical character-set settings for an international-oriented client (notice the use of `utf8` Unicode) connected to a server in the West (`latin1` is a West Europe character set).

Although Unicode (usually the `utf8` variant on Unix, and the `ucs2` variant on Windows) is preferable to Latin, it is often not what your operating system utilities support best. Many Windows users find that a Microsoft character set, such as `cp932` for Japanese Windows, is suitable.

If you cannot control the server settings, and you have no idea what setting your underlying computer uses, try changing to a common character set for the country that you're in (`euckr` = Korea; `gb18030`, `gb2312` or `gbk` = People's Republic of China; `big5` = Taiwan; `sjis`,

`ujis`, `cp932`, or `eucjpms` = Japan; `ucs2` or `utf8` = anywhere). Usually it is necessary to change only the client and connection and results settings. The `SET NAMES` statement changes all three at once. For example:

```
SET NAMES 'big5';
```

Once the setting is correct, you can make it permanent by editing `my.cnf` or `my.ini`. For example you might add lines looking like these:

```
[mysqld]
character-set-server=big5
[client]
default-character-set=big5
```

It is also possible that there are issues with the API configuration setting being used in your application; see *Why does my GUI front end or browser not display CJK characters correctly...?* for more information.

#### A.11.3 What problems should I be aware of when working with the Big5 Chinese character set?

MySQL supports the Big5 character set which is common in Hong Kong and Taiwan (Republic of China). The MySQL `big5` character set is in reality Microsoft code page 950, which is very similar to the original `big5` character set.

A feature request for adding `HKSCS` extensions has been filed. People who need this extension may find the suggested patch for Bug #13577 to be of interest.

#### A.11.4 Why do Japanese character set conversions fail?

MySQL supports the `sjis`, `ujis`, `cp932`, and `eucjpms` character sets, as well as Unicode. A common need is to convert between character sets. For example, there might be a Unix server (typically with `sjis` or `ujis`) and a Windows client (typically with `cp932`).

In the following conversion table, the `ucs2` column represents the source, and the `sjis`, `cp932`, `ujis`, and `eucjpms` columns represent the destinations; that is, the last 4 columns provide the hexadecimal result when we use `CONVERT(ucs2)` or we assign a `ucs2` column containing the value to an `sjis`, `cp932`, `ujis`, or `eucjpms` column.

Character Name	ucs2	sjis	cp932	ujis	eucjpms
BROKEN BAR	00A6	3F	3F	8FA2C3	3F
FULLWIDTH BROKEN BAR	FFE4	3F	FA55	3F	8FA2
YEN SIGN	00A5	3F	3F	20	3F
FULLWIDTH YEN SIGN	FFE5	818F	818F	A1EF	3F
TILDE	007E	7E	7E	7E	7E
OVERLINE	203E	3F	3F	20	3F
HORIZONTAL BAR	2015	815C	815C	A1BD	A1BD
EM DASH	2014	3F	3F	3F	3F
REVERSE SOLIDUS	005C	815F	5C	5C	5C
FULLWIDTH REVERSE SOLIDUS	FF3C	3F	815F	3F	A1C0
WAVE DASH	301C	8160	3F	A1C1	3F

Character Name	ucs2	sjis	cp932	ujis	eucjpm
FULLWIDTH TILDE	FF5E	3F	8160	3F	A1C1
DOUBLE VERTICAL LINE	2016	8161	3F	A1C2	3F
PARALLEL TO	2225	3F	8161	3F	A1C2
MINUS SIGN	2212	817C	3F	A1DD	3F
FULLWIDTH HYPHEN-MINUS	FF0D	3F	817C	3F	A1DD
CENT SIGN	00A2	8191	3F	A1F1	3F
FULLWIDTH CENT SIGN	FFE0	3F	8191	3F	A1F1
POUND SIGN	00A3	8192	3F	A1F2	3F
FULLWIDTH POUND SIGN	FFE1	3F	8192	3F	A1F2
NOT SIGN	00AC	81CA	3F	A2CC	3F
FULLWIDTH NOT SIGN	FFE2	3F	81CA	3F	A2CC

Now consider the following portion of the table.

	ucs2	sjis	cp932
NOT SIGN	00AC	81CA	3F
FULLWIDTH NOT SIGN	FFE2	3F	81CA

This means that MySQL converts the `NOT SIGN` (Unicode `U+00AC`) to `sjis` code point `0x81CA` and to `cp932` code point `3F`. (`3F` is the question mark (“?”). This is what is always used when the conversion cannot be performed.)

#### A.11.5 What should I do if I want to convert SJIS `81CA` to `cp932`?

Our answer is: “?”. There are disadvantages to this, and many people would prefer a “loose” conversion, so that `81CA (NOT SIGN)` in `sjis` becomes `81CA (FULLWIDTH NOT SIGN)` in `cp932`.

#### A.11.6 How does MySQL represent the Yen (¥) sign?

A problem arises because some versions of Japanese character sets (both `sjis` and `euc`) treat `5C` as a *reverse solidus* (\, also known as a backslash), whereas others treat it as a yen sign (¥).

MySQL follows only one version of the JIS (Japanese Industrial Standards) standard description. In MySQL, `5C` is always the *reverse solidus* (\).

#### A.11.7 Of what issues should I be aware when working with Korean character sets in MySQL?

In theory, while there have been several versions of the `euckr` (*Extended Unix Code Korea*) character set, only one problem has been noted. We use the “ASCII” variant of EUC-KR, in which the code point `0x5c` is REVERSE SOLIDUS, that is \, instead of the “KS-Roman” variant

of EUC-KR, in which the code point `0x5c` is WON SIGN (₩). This means that you cannot convert Unicode `U+20A9` to `euckr`:

```
mysql> SELECT
 CONVERT('₩' USING euckr) AS euckr,
 HEX(CONVERT('₩' USING euckr)) AS hexeuckr;
+-----+-----+
| euckr | hexeuckr |
+-----+-----+
| ? | 3F |
+-----+-----+
```

#### A.11.8 Why do I get `Incorrect string value` error messages?

To see the problem, create a table with one Unicode (`ucs2`) column and one Chinese (`gb2312`) column.

```
mysql> CREATE TABLE ch
 (ucs2 CHAR(3) CHARACTER SET ucs2,
 gb2312 CHAR(3) CHARACTER SET gb2312);
```

In nonstrict SQL mode, try to place the rare character ₩ in both columns.

```
mysql> SET sql_mode = '';
mysql> INSERT INTO ch VALUES ('A₩B','A₩B');
Query OK, 1 row affected, 1 warning (0.00 sec)
```

The `INSERT` produces a warning. Use the following statement to see what it is:

```
mysql> SHOW WARNINGS\G
***** 1. row *****
Level: Warning
Code: 1366
Message: Incorrect string value: '\xE6\xB1\x8CB' for column 'gb2312' at row 1
```

So it is a warning about the `gb2312` column only.

```
mysql> SELECT ucs2,HEX(ucs2),gb2312,HEX(gb2312) FROM ch;
+-----+-----+-----+
| ucs2 | HEX(ucs2) | gb2312 | HEX(gb2312) |
+-----+-----+-----+
| A₩B | 00416C4C0042 | A?B | 413F42 |
+-----+-----+-----+
```

Several things need explanation here:

1. The ₩ character is not in the `gb2312` character set, as described earlier.
2. If you are using an old version of MySQL, you may see a different message.
3. A warning occurs rather than an error because MySQL is not set to use strict SQL mode. In nonstrict mode, MySQL tries to do what it can, to get the best fit, rather than give up. With strict SQL mode, the `Incorrect string value` message occurs as an error rather than a warning, and the `INSERT` fails.

#### A.11.9 Why does my GUI front end or browser display CJK characters incorrectly in my application using Access, PHP, or another API?

Obtain a direct connection to the server using the `mysql` client, and try the same query there. If `mysql` responds correctly, the trouble may be that your application interface requires initialization. Use `mysql` to tell you what character set or sets it uses with the statement `SHOW VARIABLES LIKE 'char%'`. If you are using Access, you are most likely connecting with Connector/ODBC. In this case, you should check [Configuring Connector/ODBC](#). If, for example, you use `big5`, you would enter `SET NAMES 'big5'`. (In this case, no `:` character is required.) If you are using ASP, you might need to add `SET NAMES` in the code. Here is an example that has worked in the past:

```
<%
Session.CodePage=0
Dim strConnection
Dim Conn
strConnection="driver={MySQL ODBC 3.51 Driver};server=server;uid=username; " \
 & "pwd=password;database=database;stmt=SET NAMES 'big5';"
Set Conn = Server.CreateObject("ADODB.Connection")
Conn.Open strConnection
%>
```

In much the same way, if you are using any character set other than [latin1](#) with Connector/NET, you must specify the character set in the connection string. See [Connector/NET Connections](#), for more information.

If you are using PHP, try this:

```
<?php
$link = new mysqli($host, $usr, $pwd, $db);

if(mysqli_connect_errno())
{
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

$link->query("SET NAMES 'utf8'");
?>
```

In this case, we used [SET NAMES](#) to change [character\\_set\\_client](#), [character\\_set\\_connection](#), and [character\\_set\\_results](#).

Another issue often encountered in PHP applications has to do with assumptions made by the browser. Sometimes adding or changing a [`<meta>`](#) tag suffices to correct the problem: for example, to insure that the user agent interprets page content as [UTF-8](#), include [`<meta http-equiv="Content-Type" content="text/html; charset=utf-8">`](#) in the [`<head>`](#) section of the HTML page.

If you are using Connector/J, see [Using Character Sets and Unicode](#).

#### A.11.10 I've upgraded to MySQL 8.4. How can I revert to behavior like that in MySQL 4.0 with regard to character sets?

In MySQL Version 4.0, there was a single “global” character set for both server and client, and the decision as to which character to use was made by the server administrator. This changed starting with MySQL Version 4.1. What happens now is a “handshake”, as described in [Section 12.4, “Connection Character Sets and Collations”](#):

When a client connects, it sends to the server the name of the character set that it wants to use. The server uses the name to set the [character\\_set\\_client](#), [character\\_set\\_results](#), and [character\\_set\\_connection](#) system variables. In effect, the server performs a [SET NAMES](#) operation using the character set name.

The effect of this is that you cannot control the client character set by starting [mysqld](#) with [`--character-set-server=utf8`](#). However, some Asian customers prefer the MySQL 4.0 behavior. To make it possible to retain this behavior, we added a [mysqld](#) switch, [`--character-set-client-handshake`](#), which can be turned off with [`--skip-character-set-client-handshake`](#). If you start [mysqld](#) with [`--skip-character-set-client-handshake`](#), then, when a client connects, it sends to the server the name of the character set that it wants to use. However, *the server ignores this request from the client*.

By way of example, suppose that your favorite server character set is `latin1`. Suppose further that the client uses `utf8` because this is what the client's operating system supports. Start the server with `latin1` as its default character set:

```
mysqld --character-set-server=latin1
```

And then start the client with the default character set `utf8`:

```
mysql --default-character-set=utf8
```

The resulting settings can be seen by viewing the output of `SHOW VARIABLES`:

```
mysql> SHOW VARIABLES LIKE 'char%';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| character_set_client | utf8 |
| character_set_connection | utf8 |
| character_set_database | latin1 |
| character_set_filesystem | binary |
| character_set_results | utf8 |
| character_set_server | latin1 |
| character_set_system | utf8 |
| character_sets_dir | /usr/local/mysql/share/mysql/charsets/ |
+-----+-----+
```

Now stop the client, and stop the server using `mysqladmin`. Then start the server again, but this time tell it to skip the handshake like so:

```
mysqld --character-set-server=utf8 --skip-character-set-client-handshake
```

Start the client with `utf8` once again as the default character set, then display the resulting settings:

```
mysql> SHOW VARIABLES LIKE 'char%';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| character_set_client | latin1 |
| character_set_connection | latin1 |
| character_set_database | latin1 |
| character_set_filesystem | binary |
| character_set_results | latin1 |
| character_set_server | latin1 |
| character_set_system | utf8 |
| character_sets_dir | /usr/local/mysql/share/mysql/charsets/ |
+-----+-----+
```

As you can see by comparing the differing results from `SHOW VARIABLES`, the server ignores the client's initial settings if the `--skip-character-set-client-handshake` option is used.

#### A.11.1 Why do some `LIKE` and `FULLTEXT` searches with CJK characters fail?

For `LIKE` searches, there is a very simple problem with binary string column types such as `BINARY` and `BLOB`: we must know where characters end. With multibyte character sets, different characters might have different octet lengths. For example, in `utf8`, `A` requires one byte but `𠂇` requires three bytes, as shown here:

```
+-----+-----+
| OCTET_LENGTH(_utf8 'A') | OCTET_LENGTH(_utf8 '𠂇') |
+-----+-----+
| 1 | 3 |
+-----+-----+
```

If we do not know where the first character in a string ends, we do not know where the second character begins, in which case even very simple searches such as `LIKE '_A%`' fail. The

solution is to use a nonbinary string column type defined to have the proper CJK character set. For example: `mycol TEXT CHARACTER SET sjis`. Alternatively, convert to a CJK character set before comparing.

This is one reason why MySQL cannot permit encodings of nonexistent characters. If it is not strict about rejecting bad input, it has no way of knowing where characters end.

For `FULLTEXT` searches, we must know where words begin and end. With Western languages, this is rarely a problem because most (if not all) of these use an easy-to-identify word boundary: the space character. However, this is not usually the case with Asian writing. We could use arbitrary halfway measures, like assuming that all Han characters represent words, or (for Japanese) depending on changes from Katakana to Hiragana due to grammatical endings. However, the only sure solution requires a comprehensive word list, which means that we would have to include a dictionary in the server for each Asian language supported. This is simply not feasible.

#### A.11.12 How do I know whether character `X` is available in all character sets?

The majority of simplified Chinese and basic nonhalfwidth Japanese Kana characters appear in all CJK character sets. The following stored procedure accepts a `UCS-2` Unicode character, converts it to other character sets, and displays the results in hexadecimal.

```
DELIMITER //

CREATE PROCEDURE p_convert(ucs2_char CHAR(1) CHARACTER SET ucs2)
BEGIN

CREATE TABLE tj
 (ucs2 CHAR(1) character set ucs2,
 utf8 CHAR(1) character set utf8,
 big5 CHAR(1) character set big5,
 cp932 CHAR(1) character set cp932,
 eucjpms CHAR(1) character set eucjpms,
 euckr CHAR(1) character set euckr,
 gb2312 CHAR(1) character set gb2312,
 gbk CHAR(1) character set gbk,
 sjis CHAR(1) character set sjis,
 ujis CHAR(1) character set ujis);

INSERT INTO tj (ucs2) VALUES (ucs2_char);

UPDATE tj SET utf8=ucs2,
 big5=ucs2,
 cp932=ucs2,
 eucjpms=ucs2,
 euckr=ucs2,
 gb2312=ucs2,
 gbk=ucs2,
 sjis=ucs2,
 ujis=ucs2;

/* If there are conversion problems, UPDATE produces warnings. */

SELECT hex(ucs2) AS ucs2,
 hex(utf8) AS utf8,
 hex(big5) AS big5,
 hex(cp932) AS cp932,
 hex(eucjpms) AS eucjpms,
 hex(euckr) AS euckr,
 hex(gb2312) AS gb2312,
 hex(gbk) AS gbk,
 hex(sjis) AS sjis,
 hex(ujis) AS ujis
FROM tj;

DROP TABLE tj;

END//
```

```
DELIMITER ;
```

The input can be any single `ucs2` character, or it can be the code value (hexadecimal representation) of that character. For example, from Unicode's list of `ucs2` encodings and names (<http://www.unicode.org/Public/UNIDATA/UnicodeData.txt>), we know that the Katakana character `Pe` appears in all CJK character sets, and that its code value is `X'30DA'`. If we use this value as the argument to `p_convert()`, the result is as shown here:

```
mysql> CALL p_convert(X'30DA');
+-----+-----+-----+-----+-----+-----+-----+-----+
| ucs2 | utf8 | big5 | cp932 | eucjpm | euckr | gb2312 | gbk | sjis | ujis |
+-----+-----+-----+-----+-----+-----+-----+-----+
| 30DA | E3839A | C772 | 8379 | A5DA | ABDA | A5DA | A5DA | 8379 | A5DA |
+-----+-----+-----+-----+-----+-----+-----+-----+
```

Since none of the column values is `3F` (that is, the question mark character, `?`), we know that every conversion worked.

#### A.11.13 Why do CJK strings sort incorrectly in Unicode? (I)

CJK sorting problems that occurred in older MySQL versions can be solved as of MySQL 8.0 by using the `utf8mb4` character set and the `utf8mb4_ja_0900_as_cs` collation.

#### A.11.14 Why do CJK strings sort incorrectly in Unicode? (II)

CJK sorting problems that occurred in older MySQL versions can be solved as of MySQL 8.0 by using the `utf8mb4` character set and the `utf8mb4_ja_0900_as_cs` collation.

#### A.11.15 Why are my supplementary characters rejected by MySQL?

Supplementary characters lie outside the Unicode *Basic Multilingual Plane / Plane 0*. BMP characters have code point values between `U+0000` and `U+FFFF`. Supplementary characters have code point values between `U+10000` and `U+10FFFF`.

To store supplementary characters, you must use a character set that permits them:

- The `utf8` and `ucs2` character sets support BMP characters only.

The `utf8` character set permits only `UTF-8` characters that take up to three bytes. This has led to reports such as that found in Bug #12600, which we rejected as “not a bug”. With `utf8`, MySQL must truncate an input string when it encounters bytes that it does not understand. Otherwise, it is unknown how long the bad multibyte character is.

One possible workaround is to use `ucs2` instead of `utf8`, in which case the “bad” characters are changed to question marks. However, no truncation takes place. You can also change the data type to `BLOB` or `BINARY`, which perform no validity checking.

- The `utf8mb4`, `utf16`, `utf16le`, and `utf32` character sets support BMP characters, as well as supplementary characters outside the BMP.

#### A.11.16 Should “CJK” be “CJKV”?

No. The term “CJKV” (*Chinese Japanese Korean Vietnamese*) refers to Vietnamese character sets which contain Han (originally Chinese) characters. MySQL supports the modern Vietnamese script with Western characters, but does not support the old Vietnamese script using Han characters.

As of MySQL 5.6, there are Vietnamese collations for Unicode character sets, as described in [Section 12.10.1, “Unicode Character Sets”](#).

#### A.11.17 Does MySQL permit CJK characters to be used in database and table names?

Yes.

**A.11.18** Where can I find translations of the MySQL Manual into Chinese, Japanese, and Korean?

The Japanese translation of the MySQL 5.6 manual can be downloaded from <https://dev.mysql.com/doc/>.

**A.11.19** Where can I get help with CJK and related issues in MySQL?

The following resources are available:

- A listing of MySQL user groups can be found at <https://wikis.oracle.com/display/mysql>List+of+MySQL+User+Groups>.
- View feature requests relating to character set issues at <http://tinyurl.com/y6xcuf>.
- Visit the MySQL Character Sets, Collation, Unicode Forum. <http://forums.mysql.com/> also provides foreign-language forums.

## A.12 MySQL 8.4 FAQ: Connectors & APIs

For common questions, issues, and answers relating to the MySQL Connectors and other APIs, see the following areas of the Manual:

- [Using C API Features](#)
- [Connector/ODBC Notes and Tips](#)
- [Connector/.NET Programming](#)
- [MySQL Connector/J Developer Guide](#)

## A.13 MySQL 8.4 FAQ: C API, libmysql

Frequently asked questions about MySQL C API and libmysql.

A.13.1 What is “MySQL Native C API”? What are typical benefits and use cases? .....	5139
A.13.2 Which version of libmysql should I use? .....	5139
A.13.3 What if I want to use the “NoSQL” X DevAPI? .....	5139
A.13.4 How to I download libmysql? .....	5139
A.13.5 Where is the documentation? .....	5140
A.13.6 How do I report bugs? .....	5140
A.13.7 Is it possible to compile the library myself? .....	5140

**A.13.1** What is “MySQL Native C API”? What are typical benefits and use cases?

libmysql is a C-based API that you can use in C applications to connect with the MySQL database server. It is also itself used as the foundation for drivers for standard database APIs like ODBC, Perl's DBI, and Python's DB API.

**A.13.2** Which version of libmysql should I use?

For MySQL 8.4 we recommend libmysql 8.4.

**A.13.3** What if I want to use the “NoSQL” X DevAPI?

For C-language and X DevApi Document Store for MySQL, we recommend MySQL Connector/C++. Connector/C++ has compatible C headers. (This is not applicable to MySQL 5.7 or before.)

**A.13.4** How to I download libmysql?

- Linux: The Client Utilities Package is available from the [MySQL Community Server](#) download page.

- **Repos:** The Client Utilities Package is available from the [Yum](#), [APT](#), [SuSE](#) repositories.
- **Windows:** The Client Utilities Package is available from [Windows Installer](#).

#### A.13.5 Where is the documentation?

See [MySQL 8.4 C API Developer Guide](#).

#### A.13.6 How do I report bugs?

Please report any bugs or inconsistencies you observe to our [Bugs Database](#). Select the C API Client as shown.

#### A.13.7 Is it possible to compile the library myself?

Compiling MySQL Server also compiles libmysqlclient; there is not a way to only compile libmysqlclient. For related information, see [MySQL C API Implementations](#).

## A.14 MySQL 8.4 FAQ: Replication

In the following section, we provide answers to questions that are most frequently asked about MySQL Replication.

A.14.1 Must the replica be connected to the source all the time? .....	5140
A.14.2 Must I enable networking on my source and replica to enable replication? .....	5140
A.14.3 How do I know how late a replica is compared to the source? In other words, how do I know the date of the last statement replicated by the replica? .....	5141
A.14.4 How do I force the source to block updates until the replica catches up? .....	5141
A.14.5 What issues should I be aware of when setting up two-way replication? .....	5141
A.14.6 How can I use replication to improve performance of my system? .....	5142
A.14.7 What should I do to prepare client code in my own applications to use performance-enhancing replication? .....	5142
A.14.8 When and how much can MySQL replication improve the performance of my system? .....	5142
A.14.9 How can I use replication to provide redundancy or high availability? .....	5143
A.14.10 How do I tell whether a replication source server is using statement-based or row-based binary logging format? .....	5143
A.14.11 How do I tell a replica to use row-based replication? .....	5143
A.14.12 How do I prevent <code>GRANT</code> and <code>REVOKE</code> statements from replicating to replica machines? ..	5143
A.14.13 Does replication work on mixed operating systems (for example, the source runs on Linux while replicas run on macOS and Windows)? .....	5143
A.14.14 Does replication work on mixed hardware architectures (for example, the source runs on a 64-bit machine while replicas run on 32-bit machines)? .....	5143

#### A.14.1 Must the replica be connected to the source all the time?

No, it does not. The replica can go down or stay disconnected for hours or even days, and then reconnect and catch up on updates. For example, you can set up a source/replica relationship over a dial-up link where the link is up only sporadically and for short periods of time. The implication of this is that, at any given time, the replica is not guaranteed to be in synchrony with the source unless you take some special measures.

To ensure that catchup can occur for a replica that has been disconnected, you must not remove binary log files from the source that contain information that has not yet been replicated to the replicas. Asynchronous replication can work only if the replica is able to continue reading the binary log from the point where it last read events.

#### A.14.2 Must I enable networking on my source and replica to enable replication?

Yes, networking must be enabled on the source and replica. If networking is not enabled, the replica cannot connect to the source and transfer the binary log. Verify that the

`skip_networking` system variable has not been enabled in the configuration file for either server.

**A.14.3** How do I know how late a replica is compared to the source? In other words, how do I know the date of the last statement replicated by the replica?

Check the `Seconds_Behind_Master` column in the output from `SHOW REPLICAS | SLAVE STATUS`. See [Section 19.1.7.1, “Checking Replication Status”](#).

When the replication SQL thread executes an event read from the source, it modifies its own time to the event timestamp. (This is why `TIMESTAMP` is well replicated.) In the `Time` column in the output of `SHOW PROCESSLIST`, the number of seconds displayed for the replication SQL thread is the number of seconds between the timestamp of the last replicated event and the real time of the replica machine. You can use this to determine the date of the last replicated event. Note that if your replica has been disconnected from the source for one hour, and then reconnects, you may immediately see large `Time` values such as 3600 for the replication SQL thread in `SHOW PROCESSLIST`. This is because the replica is executing statements that are one hour old. See [Section 19.2.3, “Replication Threads”](#).

**A.14.4** How do I force the source to block updates until the replica catches up?

Use the following procedure:

1. On the source, execute these statements:

```
mysql> FLUSH TABLES WITH READ LOCK;
mysql> SHOW MASTER STATUS;
```

Record the replication coordinates (the current binary log file name and position) from the output of the `SHOW` statement.

2. On the replica, issue the following statement, where the arguments to the `SOURCE_POS_WAIT()` or `MASTER_POS_WAIT()` function are the replication coordinate values obtained in the previous step:

```
mysql> SELECT MASTER_POS_WAIT('log_name', log_pos);
Or from MySQL 8.0.26:
mysql> SELECT SOURCE_POS_WAIT('log_name', log_pos);
```

The `SELECT` statement blocks until the replica reaches the specified log file and position. At that point, the replica is in synchrony with the source and the statement returns.

3. On the source, issue the following statement to enable the source to begin processing updates again:

```
mysql> UNLOCK TABLES;
```

**A.14.5** What issues should I be aware of when setting up two-way replication?

MySQL replication currently does not support any locking protocol between source and replica to guarantee the atomicity of a distributed (cross-server) update. In other words, it is possible for client A to make an update to co-source 1, and in the meantime, before it propagates to co-source 2, client B could make an update to co-source 2 that makes the update of client A work differently than it did on co-source 1. Thus, when the update of client A makes it to co-source 2, it produces tables that are different from what you have on co-source 1, even after all the updates from co-source 2 have also propagated. This means that you should not chain two servers together in a two-way replication relationship unless you are sure that your updates can safely happen in any order, or unless you take care of mis-ordered updates somehow in the client code.

You should also realize that two-way replication actually does not improve performance very much (if at all) as far as updates are concerned. Each server must do the same number of

updates, just as you would have a single server do. The only difference is that there is a little less lock contention because the updates originating on another server are serialized in one replication thread. Even this benefit might be offset by network delays.

#### A.14.6 How can I use replication to improve performance of my system?

Set up one server as the source and direct all writes to it. Then configure as many replicas as you have the budget and rackspace for, and distribute the reads among the source and the replicas. You can also start the replicas with the `--skip-innodb` option, enable the `low_priority_updates` system variable, and set the `delay_key_write` system variable to `ALL` to get speed improvements on the replica end. In this case, the replica uses nontransactional `MyISAM` tables instead of `InnoDB` tables to get more speed by eliminating transactional overhead.

#### A.14.7 What should I do to prepare client code in my own applications to use performance-enhancing replication?

See the guide to using replication as a scale-out solution, [Section 19.4.5, “Using Replication for Scale-Out”](#).

#### A.14.8 When and how much can MySQL replication improve the performance of my system?

MySQL replication is most beneficial for a system that processes frequent reads and infrequent writes. In theory, by using a single-source/multiple-replica setup, you can scale the system by adding more replicas until you either run out of network bandwidth, or your update load grows to the point that the source cannot handle it.

To determine how many replicas you can use before the added benefits begin to level out, and how much you can improve performance of your site, you must know your query patterns, and determine empirically by benchmarking the relationship between the throughput for reads and writes on a typical source and a typical replica. The example here shows a rather simplified calculation of what you can get with replication for a hypothetical system. Let `reads` and `writes` denote the number of reads and writes per second, respectively.

Let's say that system load consists of 10% writes and 90% reads, and we have determined by benchmarking that `reads` is  $1200 - 2 * \text{writes}$ . In other words, the system can do 1,200 reads per second with no writes, the average write is twice as slow as the average read, and the relationship is linear. Suppose that the source and each replica have the same capacity, and that we have one source and  $N$  replicas. Then we have for each server (source or replica):

$$\text{reads} = 1200 - 2 * \text{writes}$$

$$\text{reads} = 9 * \text{writes} / (N + 1) \quad (\text{reads are split, but writes replicated to all replicas})$$

$$9 * \text{writes} / (N + 1) + 2 * \text{writes} = 1200$$

$$\text{writes} = 1200 / (2 + 9/(N + 1))$$

The last equation indicates the maximum number of writes for  $N$  replicas, given a maximum possible read rate of 1,200 per second and a ratio of nine reads per write.

This analysis yields the following conclusions:

- If  $N = 0$  (which means we have no replication), our system can handle about  $1200/11 = 109$  writes per second.
- If  $N = 1$ , we get up to 184 writes per second.
- If  $N = 8$ , we get up to 400 writes per second.
- If  $N = 17$ , we get up to 480 writes per second.

- Eventually, as  $N$  approaches infinity (and our budget negative infinity), we can get very close to 600 writes per second, increasing system throughput about 5.5 times. However, with only eight servers, we increase it nearly four times.

These computations assume infinite network bandwidth and neglect several other factors that could be significant on your system. In many cases, you may not be able to perform a computation similar to the one just shown that accurately predicts what happens on your system if you add  $N$  replicas. However, answering the following questions should help you decide whether and by how much replication may improve the performance of your system:

- What is the read/write ratio on your system?
- How much more write load can one server handle if you reduce the reads?
- For how many replicas do you have bandwidth available on your network?

#### A.14.9 How can I use replication to provide redundancy or high availability?

How you implement redundancy is entirely dependent on your application and circumstances. High-availability solutions (with automatic failover) require active monitoring and either custom scripts or third party tools to provide the failover support from the original MySQL server to the replica.

To handle the process manually, you should be able to switch from a failed source to a pre-configured replica by altering your application to talk to the new server or by adjusting the DNS for the MySQL server from the failed server to the new server.

For more information and some example solutions, see [Section 19.4.8, “Switching Sources During Failover”](#).

#### A.14.10 How do I tell whether a replication source server is using statement-based or row-based binary logging format?

Check the value of the `binlog_format` system variable:

```
mysql> SHOW VARIABLES LIKE 'binlog_format';
```

The value shown is always one of `STATEMENT`, `ROW`, or `MIXED`. For `MIXED` mode, statement-based logging is used by default but replication switches automatically to row-based logging under certain conditions, such as unsafe statements. For information about when this may occur, see [Section 7.4.4.3, “Mixed Binary Logging Format”](#).

#### A.14.11 How do I tell a replica to use row-based replication?

Replicas automatically know which format to use.

#### A.14.12 How do I prevent `GRANT` and `REVOKE` statements from replicating to replica machines?

Start the server with the `--replicate-wild-ignore-table=mysql.%` option to ignore replication for tables in the `mysql` database.

#### A.14.13 Does replication work on mixed operating systems (for example, the source runs on Linux while replicas run on macOS and Windows)?

Yes.

#### A.14.14 Does replication work on mixed hardware architectures (for example, the source runs on a 64-bit machine while replicas run on 32-bit machines)?

Yes.

## A.15 MySQL 8.4 FAQ: MySQL Enterprise Thread Pool

A.15.1 What is the Thread Pool and what problem does it solve? .....	5144
A.15.2 How does the Thread Pool limit and manage concurrent sessions and transactions for optimal performance and throughput? .....	5144
A.15.3 How is the Thread Pool different from the client side Connection Pool? .....	5144
A.15.4 When should I use the Thread Pool? .....	5144
A.15.5 Are there recommended Thread Pool configurations? .....	5145

### A.15.1 What is the Thread Pool and what problem does it solve?

The MySQL Thread Pool is a MySQL server plugin that extends the default connection-handling capabilities of the MySQL server to limit the number of concurrently executing statements/queries and transactions to ensure that each has sufficient CPU and memory resources to fulfill its task. For MySQL 8.4, the Thread Pool plugin is included in MySQL Enterprise Edition, a commercial product.

The default thread-handling model in MySQL Server executes statements using one thread per client connection. As more clients connect to the server and execute statements, overall performance degrades. The Thread Pool plugin provides an alternative thread-handling model designed to reduce overhead and improve performance. The Thread Pool plugin increases server performance by efficiently managing statement execution threads for large numbers of client connections, especially on modern multi-CPU/Core systems.

For more information, see [Section 7.6.3, “MySQL Enterprise Thread Pool”](#).

### A.15.2 How does the Thread Pool limit and manage concurrent sessions and transactions for optimal performance and throughput?

The Thread Pool uses a “divide and conquer” approach to limiting and balancing concurrency. Unlike the default connection handling of the MySQL Server, the Thread Pool separates connections and threads, so there is no fixed relationship between connections and the threads that execute statements received from those connections. The Thread Pool then manages client connections within configurable thread groups, where they are prioritized and queued based on the nature of the work they were submitted to accomplish.

For more information, see [Section 7.6.3.3, “Thread Pool Operation”](#).

### A.15.3 How is the Thread Pool different from the client side Connection Pool?

The MySQL Connection Pool operates on the client side to ensure that a MySQL client does not constantly connect to and disconnect from the MySQL server. It is designed to cache idle connections in the MySQL client for use by other users as they are needed. This minimizes the overhead and expense of establishing and tearing down connections as queries are submitted to the MySQL server. The MySQL Connection Pool has no visibility as to the query handling capabilities or load of the back-end MySQL server. By contrast, the Thread Pool operates on the MySQL server side and is designed to manage the execution of inbound concurrent connections and queries as they are received from the client connections accessing the back-end MySQL database. Because of the separation of duties, the MySQL Connection Pool and Thread Pool are orthogonal and can be used independent of each other.

MySQL Connection Pooling via the MySQL Connectors is covered in [Chapter 31, \*Connectors and APIs\*](#).

### A.15.4 When should I use the Thread Pool?

There are a few rules of thumb to consider for optimal Thread Pool use cases:

The MySQL `Threads_running` variable keeps track of the number of concurrent statements currently executing in the MySQL Server. If this variable consistently exceeds a region where

the server won't operate optimally (usually going beyond 40 for InnoDB workloads), the Thread Pool should be beneficial, especially in extreme parallel overload situations.

If you are using the `innodb_thread_concurrency` to limit the number of concurrently executing statements, you should find that the Thread Pool solves the same problem, only better, by assigning connections to thread groups, then queuing executions based on transactional content, user defined designations, and so forth.

Lastly, if your workload comprises mainly short queries, the Thread Pool should be beneficial.

To learn more, see [Section 7.6.3.4, “Thread Pool Tuning”](#).

#### A.15.5 Are there recommended Thread Pool configurations?

The Thread Pool has a number of user case driven configuration parameters that affect its performance. To learn about these and tips on tuning, see [Section 7.6.3.4, “Thread Pool Tuning”](#).

## A.16 MySQL 8.4 FAQ: InnoDB Change Buffer

A.16.1 What types of operations modify secondary indexes and result in change buffering? .....	5145
A.16.2 What is the benefit of the InnoDB change buffer? .....	5145
A.16.3 Does the change buffer support other types of indexes? .....	5145
A.16.4 How much space does InnoDB use for the change buffer? .....	5145
A.16.5 How do I determine the current size of the change buffer? .....	5146
A.16.6 When does change buffer merging occur? .....	5146
A.16.7 When is the change buffer flushed? .....	5146
A.16.8 When should the change buffer be used? .....	5146
A.16.9 When should the change buffer not be used? .....	5146
A.16.10 Where can I find additional information about the change buffer? .....	5147

#### A.16.1 What types of operations modify secondary indexes and result in change buffering?

`INSERT`, `UPDATE`, and `DELETE` operations can modify secondary indexes. If an affected index page is not in the buffer pool, the changes can be buffered in the change buffer.

#### A.16.2 What is the benefit of the InnoDB change buffer?

Buffering secondary index changes when secondary index pages are not in the buffer pool avoids expensive random access I/O operations that would be required to immediately read in affected index pages from disk. Buffered changes can be applied later, in batches, as pages are read into the buffer pool by other read operations.

#### A.16.3 Does the change buffer support other types of indexes?

No. The change buffer only supports secondary indexes. Clustered indexes, full-text indexes, and spatial indexes are not supported. Full-text indexes have their own caching mechanism.

#### A.16.4 How much space does InnoDB use for the change buffer?

Prior to the introduction of the `innodb_change_buffer_max_size` configuration option in MySQL 5.6, the maximum size of the on-disk change buffer in the system tablespace was 1/3 of the InnoDB buffer pool size.

In MySQL 5.6 and later, the `innodb_change_buffer_max_size` configuration option defines the maximum size of the change buffer as a percentage of the total buffer pool size. By default, `innodb_change_buffer_max_size` is set to 25. The maximum setting is 50.

InnoDB does not buffer an operation if it would cause the on-disk change buffer to exceed the defined limit.

Change buffer pages are not required to persist in the buffer pool and may be evicted by LRU operations.

#### A.16.5 How do I determine the current size of the change buffer?

The current size of the change buffer is reported by `SHOW ENGINE INNODB STATUS \G`, under the `INSERT BUFFER AND ADAPTIVE HASH INDEX` heading. For example:

```

INSERT BUFFER AND ADAPTIVE HASH INDEX

Ibuf: size 1, free list len 0, seg size 2, 0 merges
```

Relevant data points include:

- `size`: The number of pages used within the change buffer. Change buffer size is equal to `seg size - (1 + free list len)`. The `1 +` value represents the change buffer header page.
- `seg size`: The size of the change buffer, in pages.

For information about monitoring change buffer status, see [Section 17.5.2, “Change Buffer”](#).

#### A.16.6 When does change buffer merging occur?

- When a page is read into the buffer pool, buffered changes are merged upon completion of the read, before the page is made available.
- Change buffer merging is performed as a background task. The `innodb_io_capacity` parameter sets an upper limit on the I/O activity performed by InnoDB background tasks such as merging data from the change buffer.
- A change buffer merge is performed during crash recovery. Changes are applied from the change buffer (in the system tablespace) to leaf pages of secondary indexes as index pages are read into the buffer pool.
- The change buffer is fully durable and can survive a system crash. Upon restart, change buffer merge operations resume as part of normal operations.
- A full merge of the change buffer can be forced as part of a slow server shutdown using `--innodb-fast-shutdown=0`.

#### A.16.7 When is the change buffer flushed?

Updated pages are flushed by the same flushing mechanism that flushes the other pages that occupy the buffer pool.

#### A.16.8 When should the change buffer be used?

The change buffer is a feature designed to reduce random I/O to secondary indexes as indexes grow larger and no longer fit in the InnoDB buffer pool. Generally, the change buffer should be used when the entire data set does not fit into the buffer pool, when there is substantial DML activity that modifies secondary index pages, or when there are lots of secondary indexes that are regularly changed by DML activity.

#### A.16.9 When should the change buffer not be used?

You might consider disabling the change buffer if the entire data set fits within the InnoDB buffer pool, if you have relatively few secondary indexes, or if you are using solid-state storage, where random reads are about as fast as sequential reads. Before making configuration changes, it is recommended that you run tests using a representative workload to determine if disabling the change buffer provides any benefit.

**A.16.10**Where can I find additional information about the change buffer?

See [Section 17.5.2, “Change Buffer”](#).

## A.17 MySQL 8.4 FAQ: InnoDB Data-at-Rest Encryption

A.17.1 Is data decrypted for users who are authorized to see it? .....	5147
A.17.2 What is the overhead associated with InnoDB data-at-rest encryption? .....	5147
A.17.3 What are the encryption algorithms used with InnoDB data-at-rest encryption? .....	5147
A.17.4 Is it possible to use 3rd party encryption algorithms in place of the one provided by the InnoDB data-at-rest encryption feature? .....	5147
A.17.5 Can indexed columns be encrypted? .....	5147
A.17.6 What data types and data lengths does InnoDB data-at-rest encryption support? .....	5147
A.17.7 Does data remain encrypted on the network? .....	5148
A.17.8 Does database memory contain cleartext or encrypted data? .....	5148
A.17.9 How do I know which data to encrypt? .....	5148
A.17.10 How is InnoDB data-at-rest encryption different from encryption functions MySQL already provides? .....	5148
A.17.11 Does the transportable tablespaces feature work with InnoDB data-at-rest encryption? ..	5148
A.17.12 Does compression work with InnoDB data-at-rest encryption? .....	5148
A.17.13 Can I use <code>mysqldump</code> with encrypted tables? .....	5148
A.17.14 How do I change (rotate, re-key) the master encryption key? .....	5148
A.17.15 How do I migrate data from a cleartext InnoDB tablespace to an encrypted InnoDB tablespace? .....	5148

**A.17.1**Is data decrypted for users who are authorized to see it?

Yes. InnoDB data-at-rest encryption is designed to transparently apply encryption within the database without impacting existing applications. Returning data in encrypted format would break most existing applications. InnoDB data-at-rest encryption provides the benefit of encryption without the overhead associated with traditional database encryption solutions, which would typically require expensive and substantial changes to applications, database triggers, and views.

**A.17.2**What is the overhead associated with InnoDB data-at-rest encryption?

There is no additional storage overhead. According to internal benchmarks, performance overhead amounts to a single digit percentage difference.

**A.17.3**What are the encryption algorithms used with InnoDB data-at-rest encryption?

InnoDB data-at-rest encryption supports the Advanced Encryption Standard (AES256) block-based encryption algorithm. It uses Electronic Codebook (ECB) block encryption mode for tablespace key encryption and Cipher Block Chaining (CBC) block encryption mode for data encryption.

**A.17.4**Is it possible to use 3rd party encryption algorithms in place of the one provided by the InnoDB data-at-rest encryption feature?

No, it is not possible to use other encryption algorithms. The provided encryption algorithm is broadly accepted.

**A.17.5**Can indexed columns be encrypted?

InnoDB data-at-rest encryption supports all indexes transparently.

**A.17.6**What data types and data lengths does InnoDB data-at-rest encryption support?

InnoDB data-at-rest encryption supports all supported data types. There is no data length limitation.

**A.17.7** Does data remain encrypted on the network?

Data encrypted by the [InnoDB](#) data-at-rest feature is decrypted when it is read from the tablespace file. Thus, if the data is on the network, it is in cleartext form. However, data on the network can be encrypted using MySQL network encryption, which encrypts data traveling to and from a database using SSL/TLS.

**A.17.8** Does database memory contain cleartext or encrypted data?

With [InnoDB](#) data-at-rest encryption, in-memory data is decrypted, which provides complete transparency.

**A.17.9** How do I know which data to encrypt?

Compliance with the PCI-DSS standard requires that credit card numbers (Primary Account Number, or 'PAN') be stored in encrypted form. Breach Notification Laws (for example, CA SB 1386, CA AB 1950, and similar laws in 43+ more US states) require encryption of first name, last name, driver license number, and other PII data. In early 2008, CA AB 1298 added medical and health insurance information to PII data. Additionally, industry specific privacy and security standards may require encryption of certain assets. For example, assets such as pharmaceutical research results, oil field exploration results, financial contracts, or personal data of law enforcement informants may require encryption. In the health care industry, the privacy of patient data, health records and X-ray images is of the highest importance.

**A.17.10** How is [InnoDB](#) data-at-rest encryption different from encryption functions MySQL already provides?

There are symmetric and asymmetric encryption APIs in MySQL that can be used to manually encrypt data within the database. However, the application must manage encryption keys and perform required encryption and decryption operations by calling API functions. [InnoDB](#) data-at-rest encryption requires no application changes, is transparent to end users, and provides automated, built-in key management.

**A.17.11** Does the transportable tablespaces feature work with [InnoDB](#) data-at-rest encryption?

Yes. It is supported for encrypted file-per-table tablespaces. For more information, see [Exporting Encrypted Tablespaces](#).

**A.17.12** Does compression work with [InnoDB](#) data-at-rest encryption?

Customers using [InnoDB](#) data-at-rest encryption receive the full benefit of compression because compression is applied before data blocks are encrypted.

**A.17.13** Can I use [mysqldump](#) with encrypted tables?

Yes. Because these utilities create logical backups, the data dumped from encrypted tables is not encrypted.

**A.17.14** How do I change (rotate, re-key) the master encryption key?

[InnoDB](#) data-at-rest encryption uses a two tier key mechanism. When data-at-rest encryption is used, individual tablespace keys are stored in the header of the underlying tablespace data file. Tablespace keys are encrypted using the master encryption key. The master encryption key is generated when tablespace encryption is enabled, and is stored outside the database. The master encryption key is rotated using the `ALTER INSTANCE ROTATE INNODB MASTER KEY` statement, which generates a new master encryption key, stores the key, and rotates the key into use.

**A.17.15** How do I migrate data from a cleartext [InnoDB](#) tablespace to an encrypted [InnoDB](#) tablespace?

Transferring data from one tablespace to another is not required. To encrypt data in an [InnoDB](#) file-per-table tablespace, run `ALTER TABLE tbl_name ENCRYPTION = 'Y'`. To encrypt a

general tablespace or the `mysql` tablespace, run `ALTER TABLESPACE tablespace_name ENCRYPTION = 'Y'`. Encryption support for general tablespaces was introduced in MySQL 8.0.13. Encryption support for the `mysql` system tablespace is available as of MySQL 8.0.16.

## A.18 MySQL 8.4 FAQ: Virtualization Support

A.18.1 Is MySQL supported on virtualized environments such as Oracle VM, VMWare, Docker, Microsoft Hyper-V, or others? ..... 5149

**A.18.1**Is MySQL supported on virtualized environments such as Oracle VM, VMWare, Docker, Microsoft Hyper-V, or others?

MySQL is supported on virtualized environments, but is certified only for [Oracle VM](#). Contact Oracle Support for more information.

Be aware of potential problems when using virtualization software. The usual ones are related to performance, performance degradations, slowness, or unpredictability of disk, I/O, network, and memory.

---

# Appendix B Error Messages and Common Problems

## Table of Contents

B.1 Error Message Sources and Elements .....	5151
B.2 Error Information Interfaces .....	5153
B.3 Problems and Common Errors .....	5155
B.3.1 How to Determine What Is Causing a Problem .....	5155
B.3.2 Common Errors When Using MySQL Programs .....	5156
B.3.3 Administration-Related Issues .....	5167
B.3.4 Query-Related Issues .....	5175
B.3.5 Optimizer-Related Issues .....	5181
B.3.6 Table Definition-Related Issues .....	5182
B.3.7 Known Issues in MySQL .....	5183

This appendix describes the types of error information MySQL provides and how to obtain information about them. The final section is for troubleshooting. It describes common problems and errors that may occur and potential resolutions.

## Additional Resources

Other error-related documentation includes:

- Information about configuring where and how the server writes the error log: [Section 7.4.2, “The Error Log”](#)
- Information about the character set used for error messages: [Section 12.6, “Error Message Character Set”](#)
- Information about the language used for error messages: [Section 12.12, “Setting the Error Message Language”](#)
- Information about errors related to InnoDB: [Section 17.20.5, “InnoDB Error Handling”](#)
- Information about errors specific to NDB Cluster: [NDB Cluster API Errors](#); see also [NDB API Errors and Error Handling](#), and [MGM API Errors](#)
- Descriptions of the error messages that the MySQL server and client programs generate: [MySQL 8.4 Error Message Reference](#)

## B.1 Error Message Sources and Elements

This section discusses how error messages originate within MySQL and the elements they contain.

- [Error Message Sources](#)
- [Error Message Elements](#)
- [Error Code Ranges](#)

## Error Message Sources

Error messages can originate on the server side or the client side:

- On the server side, error messages may occur during the startup and shutdown processes, as a result of issues that occur during SQL statement execution, and so forth.
  - The MySQL server writes some error messages to its error log. These indicate issues of interest to database administrators or that require DBA action.

- The server sends other error messages to client programs. These indicate issues pertaining only to a particular client. The MySQL client library takes errors received from the server and makes them available to the host client program.
- Client-side error messages are generated from within the MySQL client library, usually involving problems communicating with the server.

Example server-side error messages written to the error log:

- This message produced during the startup process provides a status or progress indicator:

```
2018-10-28T13:01:32.735983Z 0 [Note] [MY-010303] [Server] Skipping
generation of SSL certificates as options related to SSL are specified.
```

- This message indicates an issue that requires DBA action:

```
2018-10-02T03:20:39.410387Z 768 [ERROR] [MY-010045] [Server] Event Scheduler:
[evtuser@localhost][myschema.e_daily] Unknown database 'mydb'
```

Example server-side error message sent to client programs, as displayed by the `mysql` client:

```
mysql> SELECT * FROM no_such_table;
ERROR 1146 (42S02): Table 'test.no_such_table' doesn't exist
```

Example client-side error message originating from within the client library, as displayed by the `mysql` client:

```
$> mysql -h no-such-host
ERROR 2005 (HY000): Unknown MySQL server host 'no-such-host' (-2)
```

Whether an error originates from within the client library or is received from the server, a MySQL client program may respond in varying ways. As just illustrated, the client may display the error message so the user can take corrective measures. The client may instead internally attempt to resolve or retry a failed operation, or take other action.

## Error Message Elements

When an error occurs, error information includes several elements: an error code, SQLSTATE value, and message string. These elements have the following characteristics:

- Error code: This value is numeric. It is MySQL-specific and is not portable to other database systems.

Each error number has a corresponding symbolic value. Examples:

- The symbol for server error number `1146` is `ER_NO_SUCH_TABLE`.
- The symbol for client error number `2005` is `CR_UNKNOWN_HOST`.

The set of error codes used in error messages is partitioned into distinct ranges; see [Error Code Ranges](#).

Error codes are stable across General Availability (GA) releases of a given MySQL series. Before a series reaches GA status, new codes may still be under development and are subject to change.

- SQLSTATE value: This value is a five-character string (for example, '`42S02`'). SQLSTATE values are taken from ANSI SQL and ODBC and are more standardized than the numeric error codes. The first two characters of an SQLSTATE value indicate the error class:
  - Class = '`00`' indicates success.
  - Class = '`01`' indicates a warning.

- Class = '`02`' indicates "not found." This is relevant within the context of cursors and is used to control what happens when a cursor reaches the end of a data set. This condition also occurs for `SELECT ... INTO var_list` statements that retrieve no rows.
- Class > '`02`' indicates an exception.

For server-side errors, not all MySQL error numbers have corresponding SQLSTATE values. In these cases, '`HY000`' (general error) is used.

For client-side errors, the SQLSTATE value is always '`HY000`' (general error), so it is not meaningful for distinguishing one client error from another.

- Message string: This string provides a textual description of the error.

## Error Code Ranges

The set of error codes used in error messages is partitioned into distinct ranges, each with its own purpose:

- 1 to 999: Global error codes. This error code range is called "global" because it is a shared range that is used by the server as well as by clients.

When an error in this range originates on the server side, the server writes it to the error log, padding the error code with leading zeros to six digits and adding a prefix of `MY-`.

When an error in this range originates on the client side, the client library makes it available to the client program with no zero-padding or prefix.

- 1,000 to 1,999: Server error codes reserved for messages sent to clients.
- 2,000 to 2,999: Client error codes reserved for use by the client library.
- 3,000 to 4,999: Server error codes reserved for messages sent to clients.
- 5,000 to 5,999: Error codes reserved for use by X Plugin for messages sent to clients.
- 10,000 to 49,999: Server error codes reserved for messages to be written to the error log (not sent to clients).

When an error in this range occurs, the server writes it to the error log, padding the error code with leading zeros to six digits and adding a prefix of `MY-`.

- 50,000 to 51,999: Error codes reserved for use by third parties.

The server handles error messages written to the error log differently from error messages sent to clients:

- When the server writes a message to the error log, it pads the error code with leading zeros to six digits and adds a prefix of `MY-` (examples: `MY-000022`, `MY-010048`).
- When the server sends a message to a client program, it adds no zero-padding or prefix to the error code (examples: `1036`, `3013`).

## B.2 Error Information Interfaces

Error messages can originate on the server side or the client side, and each error message includes an error code, SQLSTATE value, and message string, as described in [Section B.1, "Error Message Sources and Elements"](#). For lists of server-side, client-side, and global (shared between server and clients) errors, see [MySQL 8.4 Error Message Reference](#).

For error checking from within programs, use error code numbers or symbols, not error message strings. Message strings do not change often, but it is possible. Also, if the database administrator

changes the language setting, that affects the language of message strings; see [Section 12.12, “Setting the Error Message Language”](#).

Error information in MySQL is available in the server error log, at the SQL level, from within client programs, and at the command line.

- [Error Log](#)
- [SQL Error Message Interface](#)
- [Client Error Message Interface](#)
- [Command-Line Error Message Interface](#)

## Error Log

On the server side, some messages are intended for the error log. For information about configuring where and how the server writes the log, see [Section 7.4.2, “The Error Log”](#).

Other server error messages are intended to be sent to client programs and are available as described in [Client Error Message Interface](#).

The range within which a particular error code lies determines whether the server writes an error message to the error log or sends it to clients. For information about these ranges, see [Error Code Ranges](#).

## SQL Error Message Interface

At the SQL level, there are several sources of error information in MySQL:

- SQL statement warning and error information is available through the `SHOW WARNINGS` and `SHOW ERRORS` statements. The `warning_count` system variable indicates the number of errors, warnings, and notes (with notes excluded if the `sql_notes` system variable is disabled). The `error_count` system variable indicates the number of errors. Its value excludes warnings and notes.
- The `GET DIAGNOSTICS` statement may be used to inspect the diagnostic information in the diagnostics area. See [Section 15.6.7.3, “GET DIAGNOSTICS Statement”](#).
- `SHOW REPLICAS STATUS` statement output includes information about replication errors occurring on replica servers.
- `SHOW ENGINE INNODB STATUS` statement output includes information about the most recent foreign key error if a `CREATE TABLE` statement for an InnoDB table fails.

## Client Error Message Interface

Client programs receive errors from two sources:

- Errors that originate on the client side from within the MySQL client library.
- Errors that originate on the server side and are sent to the client by the server. These are received within the client library, which makes them available to the host client program.

The range within which a particular error code lies determines whether it originated from within the client library or was received by the client from the server. For information about these ranges, see [Error Code Ranges](#).

Regardless of whether an error originates from within the client library or is received from the server, a MySQL client program obtains the error code, SQLSTATE value, message string, and other related information by calling C API functions in the client library:

- `mysql_errno()` returns the MySQL error code.
- `mysql_sqlstate()` returns the SQLSTATE value.
- `mysql_error()` returns the message string.
- `mysql_stmt_errno()`, `mysql_stmt_sqlstate()`, and `mysql_stmt_error()` are the corresponding error functions for prepared statements.
- `mysql_warning_count()` returns the number of errors, warnings, and notes for the most recent statement.

For descriptions of the client library error functions, see [MySQL 8.4 C API Developer Guide](#).

A MySQL client program may respond to an error in varying ways. The client may display the error message so the user can take corrective measures, internally attempt to resolve or retry a failed operation, or take other action. For example, (using the `mysql` client), a failure to connect to the server might result in this message:

```
$> mysql -h no-such-host
ERROR 2005 (HY000): Unknown MySQL server host 'no-such-host' (-2)
```

## Command-Line Error Message Interface

The `perror` program provides information from the command line about error numbers. See [Section 6.8.1, “perror — Display MySQL Error Message Information”](#).

```
$> perror 1231
MySQL error code MY-001231 (ER_WRONG_VALUE_FOR_VAR): Variable '%-.64s'
can't be set to the value of '%-.200s'
```

For MySQL NDB Cluster errors, use `ndb_perror`. See [Section 25.5.16, “ndb\\_perror — Obtain NDB Error Message Information”](#).

```
$> ndb_perror 323
NDB error code 323: Invalid nodegroup id, nodegroup already existing:
Permanent error: Application error
```

## B.3 Problems and Common Errors

This section lists some common problems and error messages that you may encounter. It describes how to determine the causes of the problems and what to do to solve them.

### B.3.1 How to Determine What Is Causing a Problem

When you run into a problem, the first thing you should do is to find out which program or piece of equipment is causing it:

- If you have one of the following symptoms, then it is probably a hardware problems (such as memory, motherboard, CPU, or hard disk) or kernel problem:
  - The keyboard does not work. This can normally be checked by pressing the Caps Lock key. If the Caps Lock light does not change, you have to replace your keyboard. (Before doing this, you should try to restart your computer and check all cables to the keyboard.)
  - The mouse pointer does not move.
  - The machine does not answer to a remote machine's pings.
  - Other programs that are not related to MySQL do not behave correctly.
  - Your system restarted unexpectedly. (A faulty user-level program should never be able to take down your system.)

In this case, you should start by checking all your cables and run some diagnostic tool to check your hardware! You should also check whether there are any patches, updates, or service packs for your operating system that could likely solve your problem. Check also that all your libraries (such as `glibc`) are up to date.

It is always good to use a machine with ECC memory to discover memory problems early.

- If your keyboard is locked up, you may be able to recover by logging in to your machine from another machine and executing `kbd_mode -a`.
- Please examine your system log file (`/var/log/messages` or similar) for reasons for your problem. If you think the problem is in MySQL, you should also examine MySQL's log files. See [Section 7.4, “MySQL Server Logs”](#).
- If you do not think you have hardware problems, you should try to find out which program is causing problems. Try using `top`, `ps`, Task Manager, or some similar program, to check which program is taking all CPU or is locking the machine.
- Use `top`, `df`, or a similar program to check whether you are out of memory, disk space, file descriptors, or some other critical resource.
- If the problem is some runaway process, you can always try to kill it. If it does not want to die, there is probably a bug in the operating system.

If you have examined all other possibilities and concluded that the MySQL server or a MySQL client is causing the problem, it is time to create a bug report, see [Section 1.6, “How to Report Bugs or Problems”](#). In the bug report, try to give a complete description of how the system is behaving and what you think is happening. Also state why you think that MySQL is causing the problem. Take into consideration all the situations described in this chapter. State any problems exactly how they appear when you examine your system. Use the “copy and paste” method for any output and error messages from programs and log files.

Try to describe in detail which program is not working and all symptoms you see. We have in the past received many bug reports that state only “the system does not work.” This provides us with no information about what could be the problem.

If a program fails, it is always useful to know the following information:

- Has the program in question made a segmentation fault (did it dump core)?
- Is the program taking up all available CPU time? Check with `top`. Let the program run for a while, it may simply be evaluating something computationally intensive.
- If the `mysqld` server is causing problems, can you get any response from it with `mysqladmin -u root ping` or `mysqladmin -u root processlist`?
- What does a client program say when you try to connect to the MySQL server? (Try with `mysql`, for example.) Does the client jam? Do you get any output from the program?

When sending a bug report, you should follow the outline described in [Section 1.6, “How to Report Bugs or Problems”](#).

## B.3.2 Common Errors When Using MySQL Programs

This section lists some errors that users frequently encounter when running MySQL programs. Although the problems show up when you try to run client programs, the solutions to many of the problems involves changing the configuration of the MySQL server.

### B.3.2.1 Access denied

An [Access denied](#) error can have many causes. Often the problem is related to the MySQL accounts that the server permits client programs to use when connecting. See [Section 8.2, “Access Control and Account Management”](#), and [Section 8.2.22, “Troubleshooting Problems Connecting to MySQL”](#).

### B.3.2.2 Can't connect to [local] MySQL server

A MySQL client on Unix can connect to the `mysqld` server in two different ways: By using a Unix socket file to connect through a file in the file system (default `/tmp/mysql.sock`), or by using TCP/IP, which connects through a port number. A Unix socket file connection is faster than TCP/IP, but can be used only when connecting to a server on the same computer. A Unix socket file is used if you do not specify a host name or if you specify the special host name `localhost`.

If the MySQL server is running on Windows, you can connect using TCP/IP. If the server is started with the `named_pipe` system variable enabled, you can also connect with named pipes if you run the client on the host where the server is running. The name of the named pipe is `MySQL` by default. If you do not give a host name when connecting to `mysqld`, a MySQL client first tries to connect to the named pipe. If that does not work, it connects to the TCP/IP port. You can force the use of named pipes on Windows by using `.` as the host name.

The error (2002) [Can't connect to ...](#) normally means that there is no MySQL server running on the system or that you are using an incorrect Unix socket file name or TCP/IP port number when trying to connect to the server. You should also check that the TCP/IP port you are using has not been blocked by a firewall or port blocking service.

The error (2003) [Can't connect to MySQL server on 'server' \(10061\)](#) indicates that the network connection has been refused. You should check that there is a MySQL server running, that it has network connections enabled, and that the network port you specified is the one configured on the server.

Start by checking whether there is a process named `mysqld` running on your server host. (Use `ps xa | grep mysql` on Unix or the Task Manager on Windows.) If there is no such process, you should start the server. See [Section 2.9.2, “Starting the Server”](#).

If a `mysqld` process is running, you can check it by trying the following commands. The port number or Unix socket file name might be different in your setup. `host_ip` represents the IP address of the machine where the server is running.

```
$> mysqladmin version
$> mysqladmin variables
$> mysqladmin -h `hostname` version variables
$> mysqladmin -h `hostname` --port=3306 version
$> mysqladmin -h host_ip version
$> mysqladmin --protocol=SOCKET --socket=/tmp/mysql.sock version
```

Note the use of backticks rather than forward quotation marks with the `hostname` command; these cause the output of `hostname` (that is, the current host name) to be substituted into the `mysqladmin` command. If you have no `hostname` command or are running on Windows, you can manually type the host name of your machine (without backticks) following the `-h` option. You can also try `-h 127.0.0.1` to connect with TCP/IP to the local host.

Make sure that the server has not been configured to ignore network connections or (if you are attempting to connect remotely) that it has not been configured to listen only locally on its network interfaces. If the server was started with the `skip_networking` system variable enabled, it cannot accept TCP/IP connections at all. If the server was started with the `bind_address` system variable set to `127.0.0.1`, it listens for TCP/IP connections only locally on the loopback interface and does not accept remote connections.

Check to make sure that there is no firewall blocking access to MySQL. Your firewall may be configured on the basis of the application being executed, or the port number used by MySQL for communication (3306 by default). Under Linux or Unix, check your IP tables (or similar) configuration

to ensure that the port has not been blocked. Under Windows, applications such as ZoneAlarm or Windows Firewall may need to be configured not to block the MySQL port.

Here are some reasons the `Can't connect to local MySQL server` error might occur:

- `mysqld` is not running on the local host. Check your operating system's process list to ensure the `mysqld` process is present.
- You're running a MySQL server on Windows with many TCP/IP connections to it. If you're experiencing that quite often your clients get that error, you can find a workaround here: [Connection to MySQL Server Failing on Windows](#).
- Someone has removed the Unix socket file that `mysqld` uses (`/tmp/mysql.sock` by default). For example, you might have a `cron` job that removes old files from the `/tmp` directory. You can always run `mysqladmin version` to check whether the Unix socket file that `mysqladmin` is trying to use really exists. The fix in this case is to change the `cron` job to not remove `mysql.sock` or to place the socket file somewhere else. See [Section B.3.3.6, “How to Protect or Change the MySQL Unix Socket File”](#).
- You have started the `mysqld` server with the `--socket=/path/to/socket` option, but forgotten to tell client programs the new name of the socket file. If you change the socket path name for the server, you must also notify the MySQL clients. You can do this by providing the same `--socket` option when you run client programs. You also need to ensure that clients have permission to access the `mysql.sock` file. To find out where the socket file is, you can do:

```
$> netstat -ln | grep mysql
```

See [Section B.3.3.6, “How to Protect or Change the MySQL Unix Socket File”](#).

- You are using Linux and one server thread has died (dumped core). In this case, you must kill the other `mysqld` threads (for example, with `kill`) before you can restart the MySQL server. See [Section B.3.3.3, “What to Do If MySQL Keeps Crashing”](#).
- The server or client program might not have the proper access privileges for the directory that holds the Unix socket file or the socket file itself. In this case, you must either change the access privileges for the directory or socket file so that the server and clients can access them, or restart `mysqld` with a `--socket` option that specifies a socket file name in a directory where the server can create it and where client programs can access it.

If you get the error message `Can't connect to MySQL server on some_host`, you can try the following things to find out what the problem is:

- Check whether the server is running on that host by executing `telnet some_host 3306` and pressing the Enter key a couple of times. (3306 is the default MySQL port number. Change the value if your server is listening to a different port.) If there is a MySQL server running and listening to the port, you should get a response that includes the server's version number. If you get an error such as `telnet: Unable to connect to remote host: Connection refused`, then there is no server running on the given port.
- If the server is running on the local host, try using `mysqladmin -h localhost variables` to connect using the Unix socket file. Verify the TCP/IP port number that the server is configured to listen to (it is the value of the `port` variable.)
- If you are running under Linux and Security-Enhanced Linux (SELinux) is enabled, see [Section 8.7, “SELinux”](#).

## Connection to MySQL Server Failing on Windows

When you're running a MySQL server on Windows with many TCP/IP connections to it, and you're experiencing that quite often your clients get a `Can't connect to MySQL server` error, the reason might be that Windows does not allow for enough ephemeral (short-lived) ports to serve those connections.

The purpose of `TIME_WAIT` is to keep a connection accepting packets even after the connection has been closed. This is because Internet routing can cause a packet to take a slow route to its destination and it may arrive after both sides have agreed to close. If the port is in use for a new connection, that packet from the old connection could break the protocol or compromise personal information from the original connection. The `TIME_WAIT` delay prevents this by ensuring that the port cannot be reused until after some time has been permitted for those delayed packets to arrive.

It is safe to reduce `TIME_WAIT` greatly on LAN connections because there is little chance of packets arriving at very long delays, as they could travel through the Internet with its comparatively large distances and latencies.

Windows permits ephemeral (short-lived) TCP ports to the user. After any port is closed, it remains in a `TIME_WAIT` status for 120 seconds. The port is not available again until this time expires. The default range of port numbers depends on the version of Windows, with a more limited number of ports in older versions:

- Windows through Server 2003: Ports in range 1025–5000
- Windows Vista, Server 2008, and newer: Ports in range 49152–65535

With a small stack of available TCP ports (5000) and a high number of TCP ports being open and closed over a short period of time along with the `TIME_WAIT` status you have a good chance for running out of ports. There are two ways to address this problem:

- Reduce the number of TCP ports consumed quickly by investigating connection pooling or persistent connections where possible
- Tune some settings in the Windows registry (see below)

#### Important

The following procedure involves modifying the Windows registry. Before you modify the registry, make sure to back it up and make sure that you understand how to restore it if a problem occurs. For information about how to back up, restore, and edit the registry, view the following article in the Microsoft Knowledge Base: <http://support.microsoft.com/kb/256986/EN-US/>.

1. Start Registry Editor (`Regedt32.exe`).

2. Locate the following key in the registry:

HKEY\_LOCAL\_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters

3. On the `Edit` menu, click `Add Value`, and then add the following registry value:

```
Value Name: MaxUserPort
Data Type: REG_DWORD
Value: 65534
```

This sets the number of ephemeral ports available to any user. The valid range is between 5000 and 65534 (decimal). The default value is 0x1388 (5000 decimal).

4. On the `Edit` menu, click `Add Value`, and then add the following registry value:

```
Value Name: TcpTimedWaitDelay
Data Type: REG_DWORD
Value: 30
```

This sets the number of seconds to hold a TCP port connection in `TIME_WAIT` state before closing. The valid range is between 30 and 300 decimal, although you may wish to check with Microsoft for the latest permitted values. The default value is 0x78 (120 decimal).

5. Quit Registry Editor.

6. Reboot the machine.

Note: Undoing the above should be as simple as deleting the registry entries you've created.

### B.3.2.3 Lost connection to MySQL server

There are three likely causes for this error message.

Usually it indicates network connectivity trouble and you should check the condition of your network if this error occurs frequently. If the error message includes "during query," this is probably the case you are experiencing.

Sometimes the "during query" form happens when millions of rows are being sent as part of one or more queries. If you know that this is happening, you should try increasing `net_read_timeout` from its default of 30 seconds to 60 seconds or longer, sufficient for the data transfer to complete.

More rarely, it can happen when the client is attempting the initial connection to the server. In this case, if your `connect_timeout` value is set to only a few seconds, you may be able to resolve the problem by increasing it to ten seconds, perhaps more if you have a very long distance or slow connection. You can determine whether you are experiencing this more uncommon cause by using `SHOW GLOBAL STATUS LIKE 'Aborted_connects'`. It increases by one for each initial connection attempt that the server aborts. You may see "reading authorization packet" as part of the error message; if so, that also suggests that this is the solution that you need.

If the cause is none of those just described, you may be experiencing a problem with `BLOB` values that are larger than `max_allowed_packet`, which can cause this error with some clients. Sometime you may see an `ER_NET_PACKET_TOO_LARGE` error, and that confirms that you need to increase `max_allowed_packet`.

### B.3.2.4 Password Fails When Entered Interactively

MySQL client programs prompt for a password when invoked with a `--password` or `-p` option that has no following password value:

```
$> mysql -u user_name -p
Enter password:
```

On some systems, you may find that your password works when specified in an option file or on the command line, but not when you enter it interactively at the `Enter password:` prompt. This occurs when the library provided by the system to read passwords limits password values to a small number of characters (typically eight). That is a problem with the system library, not with MySQL. To work around it, change your MySQL password to a value that is eight or fewer characters long, or put your password in an option file.

### B.3.2.5 Too many connections

If clients encounter `Too many connections` errors when attempting to connect to the `mysqld` server, all available connections are in use by other clients.

The permitted number of connections is controlled by the `max_connections` system variable. To support more connections, set `max_connections` to a larger value.

`mysqld` actually permits `max_connections` + 1 client connections. The extra connection is reserved for use by accounts that have the `CONNECTION_ADMIN` privilege (or the deprecated `SUPER` privilege). By granting the privilege to administrators and not to normal users (who should not need it), an administrator can connect to the server and use `SHOW PROCESSLIST` to diagnose problems even if the maximum number of unprivileged clients are connected. See [Section 15.7.7.31, "SHOW PROCESSLIST Statement"](#).

The server also permits administrative connections on a dedicated interface. For more information about how the server handles client connections, see [Section 7.1.12.1, "Connection Interfaces"](#).

### B.3.2.6 Out of memory

If you issue a query using the `mysql` client program and receive an error like the following one, it means that `mysql` does not have enough memory to store the entire query result:

```
mysql: Out of memory at line 42, 'malloc.c'
mysql: needed 8136 byte (8k), memory in use: 12481367 bytes (12189k)
ERROR 2008: MySQL client ran out of memory
```

To remedy the problem, first check whether your query is correct. Is it reasonable that it should return so many rows? If not, correct the query and try again. Otherwise, you can invoke `mysql` with the `--quick` option. This causes it to use the `mysql_use_result()` C API function to retrieve the result set, which places less of a load on the client (but more on the server).

### B.3.2.7 MySQL server has gone away

This section also covers the related `Lost connection to server during query` error.

The most common reason for the `MySQL server has gone away` error is that the server timed out and closed the connection. In this case, you normally get one of the following error codes (which one you get is operating system-dependent).

Error Code	Description
<code>CR_SERVER_GONE_ERROR</code>	The client couldn't send a question to the server.
<code>CR_SERVER_LOST</code>	The client didn't get an error when writing to the server, but it didn't get a full answer (or any answer) to the question.

By default, the server closes the connection after eight hours if nothing has happened. You can change the time limit by setting the `wait_timeout` variable when you start `mysqld`. See [Section 7.1.8, “Server System Variables”](#).

If you have a script, you just have to issue the query again for the client to do an automatic reconnection. This assumes that you have automatic reconnection in the client enabled (which is the default for the `mysql` command-line client).

Some other common reasons for the `MySQL server has gone away` error are:

- You (or the db administrator) has killed the running thread with a `KILL` statement or a `mysqladmin kill` command.
- You tried to run a query after closing the connection to the server. This indicates a logic error in the application that should be corrected.
- A client application running on a different host does not have the necessary privileges to connect to the MySQL server from that host.
- You got a timeout from the TCP/IP connection on the client side. This may happen if you have been using the commands: `mysql_options(..., MYSQL_OPT_READ_TIMEOUT,...)` or `mysql_options(..., MYSQL_OPT_WRITE_TIMEOUT,...)`. In this case increasing the timeout may help solve the problem.
- You have encountered a timeout on the server side and the automatic reconnection in the client is disabled (the `reconnect` flag in the `MYSQL` structure is equal to 0).
- You are using a Windows client and the server had dropped the connection (probably because `wait_timeout` expired) before the command was issued.

The problem on Windows is that in some cases MySQL does not get an error from the OS when writing to the TCP/IP connection to the server, but instead gets the error when trying to read the answer from the connection.

The solution to this is to either do a `mysql_ping()` on the connection if there has been a long time since the last query (this is what Connector/ODBC does) or set `wait_timeout` on the `mysqld` server so high that it in practice never times out.

- You can also get these errors if you send a query to the server that is incorrect or too large. If `mysqld` receives a packet that is too large or out of order, it assumes that something has gone wrong with the client and closes the connection. If you need big queries (for example, if you are working with big `BLOB` columns), you can increase the query limit by setting the server's `max_allowed_packet` variable, which has a default value of 64MB. You may also need to increase the maximum packet size on the client end. More information on setting the packet size is given in [Section B.3.2.8, “Packet Too Large”](#).

An `INSERT` or `REPLACE` statement that inserts a great many rows can also cause these sorts of errors. Either one of these statements sends a single request to the server irrespective of the number of rows to be inserted; thus, you can often avoid the error by reducing the number of rows sent per `INSERT` or `REPLACE`.

- It is also possible to see this error if host name lookups fail (for example, if the DNS server on which your server or network relies goes down). This is because MySQL is dependent on the host system for name resolution, but has no way of knowing whether it is working—from MySQL's point of view the problem is indistinguishable from any other network timeout.

You may also see the `MySQL server has gone away` error if MySQL is started with the `skip_networking` system variable enabled.

Another networking issue that can cause this error occurs if the MySQL port (default 3306) is blocked by your firewall, thus preventing any connections at all to the MySQL server.

- You can also encounter this error with applications that fork child processes, all of which try to use the same connection to the MySQL server. This can be avoided by using a separate connection for each child process.
- You have encountered a bug where the server died while executing the query.

You can check whether the MySQL server died and restarted by executing `mysqladmin version` and examining the server's uptime. If the client connection was broken because `mysqld` crashed and restarted, you should concentrate on finding the reason for the crash. Start by checking whether issuing the query again kills the server again. See [Section B.3.3.3, “What to Do If MySQL Keeps Crashing”](#).

You can obtain more information about lost connections by starting `mysqld` with the `log_error_verbosity` system variable set to 3. This logs some of the disconnection messages in the `hostname.err` file. See [Section 7.4.2, “The Error Log”](#).

If you want to create a bug report regarding this problem, be sure that you include the following information:

- Indicate whether the MySQL server died. You can find information about this in the server error log. See [Section B.3.3.3, “What to Do If MySQL Keeps Crashing”](#).
- If a specific query kills `mysqld` and the tables involved were checked with `CHECK TABLE` before you ran the query, can you provide a reproducible test case? See [Section 7.9, “Debugging MySQL”](#).
- What is the value of the `wait_timeout` system variable in the MySQL server? (`mysqladmin variables` gives you the value of this variable.)
- Have you tried to run `mysqld` with the general query log enabled to determine whether the problem query appears in the log? (See [Section 7.4.3, “The General Query Log”](#).)

See also [Section B.3.2.9, “Communication Errors and Aborted Connections”](#), and [Section 1.6, “How to Report Bugs or Problems”](#).

### B.3.2.8 Packet Too Large

A communication packet is a single SQL statement sent to the MySQL server, a single row that is sent to the client, or a binary log event sent from a replication source server to a replica.

The largest possible packet that can be transmitted to or from a MySQL 8.4 server or client is 1GB.

When a MySQL client or the `mysqld` server receives a packet bigger than `max_allowed_packet` bytes, it issues an `ER_NET_PACKET_TOO_LARGE` error and closes the connection. With some clients, you may also get a `Lost connection to MySQL server during query` error if the communication packet is too large.

Both the client and the server have their own `max_allowed_packet` variable, so if you want to handle big packets, you must increase this variable both in the client and in the server.

If you are using the `mysql` client program, its default `max_allowed_packet` variable is 16MB. To set a larger value, start `mysql` like this:

```
$> mysql --max_allowed_packet=32M
```

That sets the packet size to 32MB.

The server's default `max_allowed_packet` value is 64MB. You can increase this if the server needs to handle big queries (for example, if you are working with big `BLOB` columns). For example, to set the variable to 128MB, start the server like this:

```
$> mysqld --max_allowed_packet=128M
```

You can also use an option file to set `max_allowed_packet`. For example, to set the size for the server to 128MB, add the following lines in an option file:

```
[mysqld]
max_allowed_packet=128M
```

It is safe to increase the value of this variable because the extra memory is allocated only when needed. For example, `mysqld` allocates more memory only when you issue a long query or when `mysqld` must return a large result row. The small default value of the variable is a precaution to catch incorrect packets between the client and server and also to ensure that you do not run out of memory by using large packets accidentally.

You can also get strange problems with large packets if you are using large `BLOB` values but have not given `mysqld` access to enough memory to handle the query. If you suspect this is the case, try adding `ulimit -d 256000` to the beginning of the `mysqld_safe` script and restarting `mysqld`.

### B.3.2.9 Communication Errors and Aborted Connections

If connection problems occur such as communication errors or aborted connections, use these sources of information to diagnose problems:

- The error log. See [Section 7.4.2, “The Error Log”](#).
- The general query log. See [Section 7.4.3, “The General Query Log”](#).
- The `Aborted_xxx` and `Connection_errors_xxx` status variables. See [Section 7.1.10, “Server Status Variables”](#).
- The host cache, which is accessible using the Performance Schema `host_cache` table. See [Section 7.1.12.3, “DNS Lookups and the Host Cache”](#), and [Section 29.12.22.3, “The host\\_cache Table”](#).

If the `log_error_verbosity` system variable is set to 3, you might find messages like this in your error log:

```
[Note] Aborted connection 854 to db: 'employees' user: 'josh'
```

If a client is unable even to connect, the server increments the [Aborted\\_connects](#) status variable. Unsuccessful connection attempts can occur for the following reasons:

- A client attempts to access a database but has no privileges for it.
- A client uses an incorrect password.
- A connection packet does not contain the right information.
- It takes more than [connect\\_timeout](#) seconds to obtain a connect packet. See [Section 7.1.8, “Server System Variables”](#).

If these kinds of things happen, it might indicate that someone is trying to break into your server! If the general query log is enabled, messages for these types of problems are logged to it.

If a client successfully connects but later disconnects improperly or is terminated, the server increments the [Aborted\\_clients](#) status variable, and logs an [Aborted connection](#) message to the error log. The cause can be any of the following:

- The client program did not call [mysql\\_close\(\)](#) before exiting.
- The client had been sleeping more than [wait\\_timeout](#) or [interactive\\_timeout](#) seconds without issuing any requests to the server. See [Section 7.1.8, “Server System Variables”](#).
- The client program ended abruptly in the middle of a data transfer.

Other reasons for problems with aborted connections or aborted clients:

- The [max\\_allowed\\_packet](#) variable value is too small or queries require more memory than you have allocated for [mysqld](#). See [Section B.3.2.8, “Packet Too Large”](#).
- Use of Ethernet protocol with Linux, both half and full duplex. Some Linux Ethernet drivers have this bug. You should test for this bug by transferring a huge file using FTP between the client and server machines. If a transfer goes in burst-pause-burst-pause mode, you are experiencing a Linux duplex syndrome. Switch the duplex mode for both your network card and hub/switch to either full duplex or to half duplex and test the results to determine the best setting.
- A problem with the thread library that causes interrupts on reads.
- Badly configured TCP/IP.
- Faulty Ethernets, hubs, switches, cables, and so forth. This can be diagnosed properly only by replacing hardware.

See also [Section B.3.2.7, “MySQL server has gone away”](#).

### B.3.2.10 The table is full

If a table-full error occurs, it may be that the disk is full or that the table has reached its maximum size. The effective maximum table size for MySQL databases is usually determined by operating system constraints on file sizes, not by MySQL internal limits. See [Section 10.4.6, “Limits on Table Size”](#).

### B.3.2.11 Can't create/write to file

If you get an error of the following type for some queries, it means that MySQL cannot create a temporary file for the result set in the temporary directory:

```
Can't create/write to file '\sqla3fe_0.ism'.
```

The preceding error is a typical message for Windows; the Unix message is similar.

One fix is to start `mysqld` with the `--tmpdir` option or to add the option to the `[mysqld]` section of your option file. For example, to specify a directory of `C:\temp`, use these lines:

```
[mysqld]
tmpdir=C:/temp
```

The `C:\temp` directory must exist and have sufficient space for the MySQL server to write to. See [Section 6.2.2.2, “Using Option Files”](#).

Another cause of this error can be permissions issues. Make sure that the MySQL server can write to the `tmpdir` directory.

Check also the error code that you get with `perror`. One reason the server cannot write to a table is that the file system is full:

```
$> perror 28
OS error code 28: No space left on device
```

If you get an error of the following type during startup, it indicates that the file system or directory used for storing data files is write protected. Provided that the write error is to a test file, the error is not serious and can be safely ignored.

```
Can't create test file /usr/local/mysql/data/master.lower-test
```

### B.3.2.12 Commands out of sync

If you get `Commands out of sync; you can't run this command now` in your client code, you are calling client functions in the wrong order.

This can happen, for example, if you are using `mysql_use_result()` and try to execute a new query before you have called `mysql_free_result()`. It can also happen if you try to execute two queries that return data without calling `mysql_use_result()` or `mysql_store_result()` in between.

### B.3.2.13 Ignoring user

If you get the following error, it means that when `mysqld` was started or when it reloaded the grant tables, it found an account in the `user` table that had an invalid password.

```
Found wrong password for user 'some_user'@'some_host'; ignoring user
```

As a result, the account is simply ignored by the permission system. To fix this problem, assign a new, valid password to the account.

### B.3.2.14 Table 'tbl\_name' doesn't exist

If you get either of the following errors, it usually means that no table exists in the default database with the given name:

```
Table 'tbl_name' doesn't exist
Can't find file: 'tbl_name' (errno: 2)
```

In some cases, it may be that the table does exist but that you are referring to it incorrectly:

- Because MySQL uses directories and files to store databases and tables, database and table names are case-sensitive if they are located on a file system that has case-sensitive file names.
- Even for file systems that are not case-sensitive, such as on Windows, all references to a given table within a query must use the same lettercase.

You can check which tables are in the default database with `SHOW TABLES`. See [Section 15.7.7, “SHOW Statements”](#).

### B.3.2.15 Can't initialize character set

You might see an error like this if you have character set problems:

```
MySQL Connection Failed: Can't initialize character set charset_name
```

This error can have any of the following causes:

- The character set is a multibyte character set and you have no support for the character set in the client. In this case, you need to recompile the client by running `CMake` with the `-DDEFAULT_CHARSET=charset_name` option. See [Section 2.8.7, “MySQL Source-Configuration Options”](#).

All standard MySQL binaries are compiled with support for all multibyte character sets.

- The character set is a simple character set that is not compiled into `mysqld`, and the character set definition files are not in the place where the client expects to find them.

In this case, you need to use one of the following methods to solve the problem:

- Recompile the client with support for the character set. See [Section 2.8.7, “MySQL Source-Configuration Options”](#).
- Specify to the client the directory where the character set definition files are located. For many clients, you can do this with the `--character-sets-dir` option.
- Copy the character definition files to the path where the client expects them to be.

### B.3.2.16 File Not Found and Similar Errors

If you get `ERROR 'file_name' not found (errno: 23), Can't open file: file_name (errno: 24)`, or any other error with `errno 23` or `errno 24` from MySQL, it means that you have not allocated enough file descriptors for the MySQL server. You can use the `perror` utility to get a description of what the error number means:

```
$> perror 23
OS error code 23: File table overflow
$> perror 24
OS error code 24: Too many open files
$> perror 11
OS error code 11: Resource temporarily unavailable
```

The problem here is that `mysqld` is trying to keep open too many files simultaneously. You can either tell `mysqld` not to open so many files at once or increase the number of file descriptors available to `mysqld`.

To tell `mysqld` to keep open fewer files at a time, you can make the table cache smaller by reducing the value of the `table_open_cache` system variable (the default value is 64). This may not entirely prevent running out of file descriptors because in some circumstances the server may attempt to extend the cache size temporarily, as described in [Section 10.4.3.1, “How MySQL Opens and Closes Tables”](#). Reducing the value of `max_connections` also reduces the number of open files (the default value is 100).

To change the number of file descriptors available to `mysqld`, you can use the `--open-files-limit` option to `mysqld_safe` or set the `open_files_limit` system variable. See [Section 7.1.8, “Server System Variables”](#). The easiest way to set these values is to add an option to your option file. See [Section 6.2.2.2, “Using Option Files”](#). If you have an old version of `mysqld` that does not support setting the open files limit, you can edit the `mysqld_safe` script. There is a commented-out line `ulimit -n 256` in the script. You can remove the `#` character to uncomment this line, and change the number `256` to set the number of file descriptors to be made available to `mysqld`.

`--open-files-limit` and `ulimit` can increase the number of file descriptors, but only up to the limit imposed by the operating system. There is also a “hard” limit that can be overridden only if you start `mysqld_safe` or `mysqld` as `root` (just remember that you also need to start the server with the

--user option in this case so that it does not continue to run as root after it starts up). If you need to increase the operating system limit on the number of file descriptors available to each process, consult the documentation for your system.

#### Note

If you run the tcsh shell, ulimit does not work! tcsh also reports incorrect values when you ask for the current limits. In this case, you should start mysqld\_safe using sh.

### B.3.2.17 Table-Corruption Issues

If you have started mysqld with the myisam\_recover\_options system variable set, MySQL automatically checks and tries to repair MyISAM tables if they are marked as 'not closed properly' or 'crashed'. If this happens, MySQL writes an entry in the hostname.err file 'Warning: Checking table ...' which is followed by Warning: Repairing table if the table needs to be repaired. If you get a lot of these errors, without mysqld having died unexpectedly just before, then something is wrong and needs to be investigated further.

When the server detects MyISAM table corruption, it writes additional information to the error log, such as the name and line number of the source file, and the list of threads accessing the table. Example: Got an error from thread\_id=1, mi\_dynrec.c:368. This is useful information to include in bug reports.

See also [Section 7.1.7, “Server Command Options”](#), and [Section 7.9.1.7, “Making a Test Case If You Experience Table Corruption”](#).

## B.3.3 Administration-Related Issues

### B.3.3.1 Problems with File Permissions

If you have problems with file permissions, the UMASK or UMASK\_DIR environment variable might be set incorrectly when mysqld starts. For example, mysqld might issue the following error message when you create a table:

```
ERROR: Can't find file: 'path/with/file_name' (Errcode: 13)
```

The default UMASK and UMASK\_DIR values are 0640 and 0750, respectively. mysqld assumes that the value for UMASK or UMASK\_DIR is in octal if it starts with a zero. For example, setting UMASK=0600 is equivalent to UMASK=384 because 0600 octal is 384 decimal.

Assuming that you start mysqld using mysqld\_safe, change the default UMASK value as follows:

```
UMASK=384 # = 600 in octal
export UMASK
mysqld_safe &
```

#### Note

An exception applies for the error log file if you start mysqld using mysqld\_safe, which does not respect UMASK: mysqld\_safe may create the error log file if it does not exist prior to starting mysqld, and mysqld\_safe uses a umask set to a strict value of 0137. If this is unsuitable, create the error file manually with the desired access mode prior to executing mysqld\_safe.

By default, mysqld creates database directories with an access permission value of 0750. To modify this behavior, set the UMASK\_DIR variable. If you set its value, new directories are created with the combined UMASK and UMASK\_DIR values. For example, to give group access to all new directories, start mysqld\_safe as follows:

```
UMASK_DIR=504 # = 770 in octal
export UMASK_DIR
```

```
mysqld_safe &
```

For additional details, see [Section 6.9, “Environment Variables”](#).

### B.3.3.2 How to Reset the Root Password

If you have never assigned a `root` password for MySQL, the server does not require a password at all for connecting as `root`. However, this is insecure. For instructions on assigning a password, see [Section 2.9.4, “Securing the Initial MySQL Account”](#).

If you know the `root` password and want to change it, see [Section 15.7.1.1, “ALTER USER Statement”](#), and [Section 15.7.1.10, “SET PASSWORD Statement”](#).

If you assigned a `root` password previously but have forgotten it, you can assign a new password. The following sections provide instructions for Windows and Unix and Unix-like systems, as well as generic instructions that apply to any system.

#### Resetting the Root Password: Windows Systems

On Windows, use the following procedure to reset the password for the MySQL `'root'@'localhost'` account. To change the password for a `root` account with a different host name part, modify the instructions to use that host name.

1. Log on to your system as Administrator.
2. Stop the MySQL server if it is running. For a server that is running as a Windows service, go to the Services manager: From the **Start** menu, select **Control Panel**, then **Administrative Tools**, then **Services**. Find the MySQL service in the list and stop it.

If your server is not running as a service, you may need to use the Task Manager to force it to stop.

3. Create a text file containing the password-assignment statement on a single line. Replace the password with the password that you want to use.

```
ALTER USER 'root'@'localhost' IDENTIFIED BY 'MyNewPass';
```

4. Save the file. This example assumes that you name the file `C:\mysql-init.txt`.
5. Open a console window to get to the command prompt: From the **Start** menu, select **Run**, then enter `cmd` as the command to be run.
6. Start the MySQL server with the `init_file` system variable set to name the file (notice that the backslash in the option value is doubled):

```
C:\> cd "C:\Program Files\MySQL\MySQL Server 8.4\bin"
C:\> mysqld --init-file=C:\\mysql-init.txt
```

If you installed MySQL to a different location, adjust the `cd` command accordingly.

The server executes the contents of the file named by the `init_file` system variable at startup, changing the `'root'@'localhost'` account password.

To have server output to appear in the console window rather than in a log file, add the `--console` option to the `mysqld` command.

If you installed MySQL using the MySQL Installation Wizard, you may need to specify a `--defaults-file` option. For example:

```
C:\> mysqld
 --defaults-file="C:\\ProgramData\\MySQL\\MySQL Server 8.4\\my.ini"
 --init-file=C:\\mysql-init.txt
```

The appropriate `--defaults-file` setting can be found using the Services Manager: From the **Start** menu, select **Control Panel**, then **Administrative Tools**, then **Services**. Find the MySQL

service in the list, right-click it, and choose the `Properties` option. The `Path to executable` field contains the `--defaults-file` setting.

7. After the server has started successfully, delete `C:\mysql-init.txt`.

You should now be able to connect to the MySQL server as `root` using the new password. Stop the MySQL server and restart it normally. If you run the server as a service, start it from the Windows Services window. If you start the server manually, use whatever command you normally use.

## Resetting the Root Password: Unix and Unix-Like Systems

On Unix, use the following procedure to reset the password for the MySQL '`root'@'localhost'` account. To change the password for a `root` account with a different host name part, modify the instructions to use that host name.

The instructions assume that you start the MySQL server from the Unix login account that you normally use for running it. For example, if you run the server using the `mysql` login account, you should log in as `mysql` before using the instructions. Alternatively, you can log in as `root`, but in this case you *must* start `mysqld` with the `--user=mysql` option. If you start the server as `root` without using `--user=mysql`, the server may create `root`-owned files in the data directory, such as log files, and these may cause permission-related problems for future server startups. If that happens, you must either change the ownership of the files to `mysql` or remove them.

1. Log on to your system as the Unix user that the MySQL server runs as (for example, `mysql`).
2. Stop the MySQL server if it is running. Locate the `.pid` file that contains the server's process ID. The exact location and name of this file depend on your distribution, host name, and configuration. Common locations are `/var/lib/mysql/`, `/var/run/mysqld/`, and `/usr/local/mysql/data/`. Generally, the file name has an extension of `.pid` and begins with either `mysqld` or your system's host name.

Stop the MySQL server by sending a normal `kill` (not `kill -9`) to the `mysqld` process. Use the actual path name of the `.pid` file in the following command:

```
$> kill `cat /mysql-data-directory/host_name.pid`
```

Use backticks (not forward quotation marks) with the `cat` command. These cause the output of `cat` to be substituted into the `kill` command.

3. Create a text file containing the password-assignment statement on a single line. Replace the password with the password that you want to use.

```
ALTER USER 'root'@'localhost' IDENTIFIED BY 'MyNewPass';
```

4. Save the file. This example assumes that you name the file `/home/me/mysql-init`. The file contains the password, so do not save it where it can be read by other users. If you are not logged in as `mysql` (the user the server runs as), make sure that the file has permissions that permit `mysql` to read it.

5. Start the MySQL server with the `init_file` system variable set to name the file:

```
$> mysqld --init-file=/home/me/mysql-init &
```

The server executes the contents of the file named by the `init_file` system variable at startup, changing the '`root'@'localhost'` account password.

Other options may be necessary as well, depending on how you normally start your server. For example, `--defaults-file` may be needed before the `init_file` argument.

6. After the server has started successfully, delete `/home/me/mysql-init`.

You should now be able to connect to the MySQL server as `root` using the new password. Stop the server and restart it normally.

## Resetting the Root Password: Generic Instructions

The preceding sections provide password-resetting instructions specifically for Windows and Unix and Unix-like systems. Alternatively, on any platform, you can reset the password using the `mysql` client (but this approach is less secure):

1. Stop the MySQL server if necessary, then restart it with the `--skip-grant-tables` option.  
This enables anyone to connect without a password and with all privileges, and disables account-management statements such as `ALTER USER` and `SET PASSWORD`. Because this is insecure, if the server is started with the `--skip-grant-tables` option, it also disables remote connections by enabling `skip_networking`. On Windows platforms, this means you must also enable `shared_memory` or `named_pipe`; otherwise the server cannot start.
2. Connect to the MySQL server using the `mysql` client; no password is necessary because the server was started with `--skip-grant-tables`:

```
$> mysql
```

3. In the `mysql` client, tell the server to reload the grant tables so that account-management statements work:

```
mysql> FLUSH PRIVILEGES;
```

Then change the `'root'@'localhost'` account password. Replace the password with the password that you want to use. To change the password for a `root` account with a different host name part, modify the instructions to use that host name.

```
mysql> ALTER USER 'root'@'localhost' IDENTIFIED BY 'MyNewPass';
```

You should now be able to connect to the MySQL server as `root` using the new password. Stop the server and restart it normally (without the `--skip-grant-tables` option and without enabling the `skip_networking` system variable).

### B.3.3.3 What to Do If MySQL Keeps Crashing

Each MySQL version is tested on many platforms before it is released. This does not mean that there are no bugs in MySQL, but if there are bugs, they should be very few and can be hard to find. If you have a problem, it always helps if you try to find out exactly what crashes your system, because you have a much better chance of getting the problem fixed quickly.

First, you should try to find out whether the problem is that the `mysqld` server dies or whether your problem has to do with your client. You can check how long your `mysqld` server has been up by executing `mysqladmin version`. If `mysqld` has died and restarted, you may find the reason by looking in the server's error log. See [Section 7.4.2, “The Error Log”](#).

On some systems, you can find in the error log a stack trace of where `mysqld` died. Note that the variable values written in the error log may not always be 100% correct.

If you find that `mysqld` fails at startup during `InnoDB` recovery, refer to [Section 17.20.2, “Troubleshooting Recovery Failures”](#).

Many unexpected server exits are caused by corrupted data files or index files. MySQL updates the files on disk with the `write()` system call after every SQL statement and before the client is notified about the result. (This is not true if you are running with the `delay_key_write` system variable enabled, in which case data files are written but not index files.) This means that data file contents are safe even if `mysqld` crashes, because the operating system ensures that the unflushed data is written to disk. You can force MySQL to flush everything to disk after every SQL statement by starting `mysqld` with the `--flush` option.

The preceding means that normally you should not get corrupted tables unless one of the following happens:

- The MySQL server or the server host was killed in the middle of an update.
- You have found a bug in `mysqld` that caused it to die in the middle of an update.
- Some external program is manipulating data files or index files at the same time as `mysqld` without locking the table properly.
- You are running many `mysqld` servers using the same data directory on a system that does not support good file system locks (normally handled by the `lockd` lock manager), or you are running multiple servers with external locking disabled.
- You have a crashed data file or index file that contains very corrupt data that confused `mysqld`.
- You have found a bug in the data storage code. This is not likely, but it is at least possible. In this case, you can try to change the storage engine to another engine by using `ALTER TABLE` on a repaired copy of the table.

Because it is very difficult to know why something is crashing, first try to check whether things that work for others result in an unexpected exit for you. Try the following things:

- Stop the `mysqld` server with `mysqladmin shutdown`, run `myisamchk --silent --force */*.MYI` from the data directory to check all MyISAM tables, and restart `mysqld`. This ensures that you are running from a clean state. See [Chapter 7, MySQL Server Administration](#).
- Start `mysqld` with the general query log enabled (see [Section 7.4.3, “The General Query Log”](#)). Then try to determine from the information written to the log whether some specific query kills the server. About 95% of all bugs are related to a particular query. Normally, this is one of the last queries in the log file just before the server restarts. See [Section 7.4.3, “The General Query Log”](#). If you can repeatedly kill MySQL with a specific query, even when you have checked all tables just before issuing it, then you have isolated the bug and should submit a bug report for it. See [Section 1.6, “How to Report Bugs or Problems”](#).
- Try to make a test case that we can use to repeat the problem. See [Section 7.9, “Debugging MySQL”](#).
- Try the `fork_big.pl` script. (It is located in the `tests` directory of source distributions.)
- Configuring MySQL for debugging makes it much easier to gather information about possible errors if something goes wrong. Reconfigure MySQL with the `-DWITH_DEBUG=1` option to `CMake` and then recompile. See [Section 7.9, “Debugging MySQL”](#).
- Make sure that you have applied the latest patches for your operating system.
- Use the `--skip-external-locking` option to `mysqld`. On some systems, the `lockd` lock manager does not work properly; the `--skip-external-locking` option tells `mysqld` not to use external locking. (This means that you cannot run two `mysqld` servers on the same data directory and that you must be careful if you use `myisamchk`. Nevertheless, it may be instructive to try the option as a test.)
- If `mysqld` appears to be running but not responding, try `mysqladmin -u root processlist`. Sometimes `mysqld` is not hung even though it seems unresponsive. The problem may be that all connections are in use, or there may be some internal lock problem. `mysqladmin -u root processlist` usually is able to make a connection even in these cases, and can provide useful information about the current number of connections and their status.
- Run the command `mysqladmin -i 5 status` or `mysqladmin -i 5 -r status` in a separate window to produce statistics while running other queries.
- Try the following:
  1. Start `mysqld` from `gdb` (or another debugger). See [Section 7.9, “Debugging MySQL”](#).

2. Run your test scripts.
3. Print the backtrace and the local variables at the three lowest levels. In `gdb`, you can do this with the following commands when `mysqld` has crashed inside `gdb`:

```
backtrace
info local
up
info local
up
info local
```

With `gdb`, you can also examine which threads exist with `info threads` and switch to a specific thread with `thread N`, where `N` is the thread ID.

- Try to simulate your application with a Perl script to force MySQL to exit or misbehave.
- Send a normal bug report. See [Section 1.6, “How to Report Bugs or Problems”](#). Be even more detailed than usual. Because MySQL works for many people, the crash might result from something that exists only on your computer (for example, an error that is related to your particular system libraries).
- If you have a problem with tables containing dynamic-length rows and you are using only `VARCHAR` columns (not `BLOB` or `TEXT` columns), you can try to change all `VARCHAR` to `CHAR` with `ALTER TABLE`. This forces MySQL to use fixed-size rows. Fixed-size rows take a little extra space, but are much more tolerant to corruption.

The current dynamic row code has been in use for several years with very few problems, but dynamic-length rows are by nature more prone to errors, so it may be a good idea to try this strategy to see whether it helps.

- Consider the possibility of hardware faults when diagnosing problems. Defective hardware can be the cause of data corruption. Pay particular attention to your memory and disk subsystems when troubleshooting hardware.

#### B.3.3.4 How MySQL Handles a Full Disk

This section describes how MySQL responds to disk-full errors (such as “no space left on device”), and to quota-exceeded errors (such as “write failed” or “user block limit reached”).

This section is relevant for writes to `MyISAM` tables. It also applies for writes to binary log files and binary log index file, except that references to “row” and “record” should be understood to mean “event.”

When a disk-full condition occurs, MySQL does the following:

- It checks once every minute to see whether there is enough space to write the current row. If there is enough space, it continues as if nothing had happened.
- Every 10 minutes it writes an entry to the log file, warning about the disk-full condition.

To alleviate the problem, take the following actions:

- To continue, you only have to free enough disk space to insert all records.
- Alternatively, to abort the thread, use `mysqladmin kill`. The thread is aborted the next time it checks the disk (in one minute).
- Other threads might be waiting for the table that caused the disk-full condition. If you have several “locked” threads, killing the one thread that is waiting on the disk-full condition enables the other threads to continue.

Exceptions to the preceding behavior are when you use `REPAIR TABLE` or `OPTIMIZE TABLE` or when the indexes are created in a batch after `LOAD DATA` or after an `ALTER TABLE` statement. All of these statements may create large temporary files that, if left to themselves, would cause big problems for the rest of the system. If the disk becomes full while MySQL is doing any of these operations, it removes the big temporary files and mark the table as crashed. The exception is that for `ALTER TABLE`, the old table is left unchanged.

### B.3.3.5 Where MySQL Stores Temporary Files

On Unix, MySQL uses the value of the `TMPDIR` environment variable as the path name of the directory in which to store temporary files. If `TMPDIR` is not set, MySQL uses the system default, which is usually `/tmp`, `/var/tmp`, or `/usr/tmp`.

On Windows, MySQL checks in order the values of the `TMPDIR`, `TEMP`, and `TMP` environment variables. For the first one found to be set, MySQL uses it and does not check those remaining. If none of `TMPDIR`, `TEMP`, or `TMP` are set, MySQL uses the Windows system default, which is usually `C:\windows\temp\`.

If the file system containing your temporary file directory is too small, you can use the `mysqld --tmpdir` option to specify a directory in a file system where you have enough space.

The `--tmpdir` option can be set to a list of several paths that are used in round-robin fashion. Paths should be separated by colon characters (`:`) on Unix and semicolon characters (`:`) on Windows.

#### Note

To spread the load effectively, these paths should be located on different *physical* disks, not different partitions of the same disk.

If the MySQL server is acting as a replica, you can set the system variable `replica_load_tmpdir` to specify a separate directory for holding temporary files when replicating `LOAD DATA` statements. This directory should be in a disk-based file system (not a memory-based file system) so that the temporary files used to replicate `LOAD DATA` can survive machine restarts. The directory also should not be one that is cleared by the operating system during the system startup process. However, replication can now continue after a restart if the temporary files have been removed.

MySQL arranges that temporary files are removed if `mysqld` is terminated. On platforms that support it (such as Unix), this is done by unlinking the file after opening it. The disadvantage of this is that the name does not appear in directory listings and you do not see a big temporary file that fills up the file system in which the temporary file directory is located. (In such cases, `lsof +L1` may be helpful in identifying large files associated with `mysqld`.)

When sorting (`ORDER BY` or `GROUP BY`), MySQL normally uses one or two temporary files. The maximum disk space required is determined by the following expression:

```
(length of what is sorted + sizeof(row pointer))
* number of matched rows
* 2
```

The row pointer size is usually four bytes, but may grow in the future for really big tables.

For some statements, MySQL creates temporary SQL tables that are not hidden and have names that begin with `#sql`.

Some `SELECT` queries creates temporary SQL tables to hold intermediate results.

DDL operations that rebuild the table and are not performed online using the `ALGORITHM=INPLACE` technique create a temporary copy of the original table in the same directory as the original table.

Online DDL operations may use temporary log files for recording concurrent DML, temporary sort files when creating an index, and temporary intermediate tables files when rebuilding the table. For more information, see [Section 17.12.3, “Online DDL Space Requirements”](#).

[InnoDB](#) user-created temporary tables and on-disk internal temporary tables are created in a temporary tablespace file named `ibtmp1` in the MySQL data directory. For more information, see [Section 17.6.3.5, “Temporary Tablespaces”](#).

See also [Section 17.15.7, “InnoDB INFORMATION\\_SCHEMA Temporary Table Info Table”](#).

The optional `EXTENDED` modifier causes `SHOW TABLES` to list hidden tables created by failed `ALTER TABLE` statements. See [Section 15.7.7.39, “SHOW TABLES Statement”](#).

### B.3.3.6 How to Protect or Change the MySQL Unix Socket File

The default location for the Unix socket file that the server uses for communication with local clients is `/tmp/mysql.sock`. (For some distribution formats, the directory might be different, such as `/var/lib/mysql` for RPMs.)

On some versions of Unix, anyone can delete files in the `/tmp` directory or other similar directories used for temporary files. If the socket file is located in such a directory on your system, this might cause problems.

On most versions of Unix, you can protect your `/tmp` directory so that files can be deleted only by their owners or the superuser (`root`). To do this, set the `sticky` bit on the `/tmp` directory by logging in as `root` and using the following command:

```
$> chmod +t /tmp
```

You can check whether the `sticky` bit is set by executing `ls -ld /tmp`. If the last permission character is `t`, the bit is set.

Another approach is to change the place where the server creates the Unix socket file. If you do this, you should also let client programs know the new location of the file. You can specify the file location in several ways:

- Specify the path in a global or local option file. For example, put the following lines in `/etc/my.cnf`:

```
[mysqld]
socket=/path/to/socket

[client]
socket=/path/to/socket
```

See [Section 6.2.2.2, “Using Option Files”](#).

- Specify a `--socket` option on the command line to `mysqld_safe` and when you run client programs.
- Set the `MYSQL_UNIX_PORT` environment variable to the path of the Unix socket file.
- Recompile MySQL from source to use a different default Unix socket file location. Define the path to the file with the `MYSQL_UNIX_ADDR` option when you run `CMake`. See [Section 2.8.7, “MySQL Source-Configuration Options”](#).

You can test whether the new socket location works by attempting to connect to the server with this command:

```
$> mysqladmin --socket=/path/to/socket version
```

### B.3.3.7 Time Zone Problems

If you have a problem with `SELECT NOW()` returning values in UTC and not your local time, you have to tell the server your current time zone. The same applies if `UNIX_TIMESTAMP()` returns the wrong value. This should be done for the environment in which the server runs (for example, in `mysqld_safe` or `mysql.server`). See [Section 6.9, “Environment Variables”](#).

You can set the time zone for the server with the `--timezone=timezone_name` option to `mysqld_safe`. You can also set it by setting the `TZ` environment variable before you start `mysqld`.

The permissible values for `--timezone` or `TZ` are system dependent. Consult your operating system documentation to see what values are acceptable.

## B.3.4 Query-Related Issues

### B.3.4.1 Case Sensitivity in String Searches

For nonbinary strings (`CHAR`, `VARCHAR`, `TEXT`), string searches use the collation of the comparison operands. For binary strings (`BINARY`, `VARBINARY`, `BLOB`), comparisons use the numeric values of the bytes in the operands; this means that for alphabetic characters, comparisons are case-sensitive.

A comparison between a nonbinary string and binary string is treated as a comparison of binary strings.

Simple comparison operations (`>=`, `>`, `=`, `<`, `<=`, sorting, and grouping) are based on each character's "sort value." Characters with the same sort value are treated as the same character. For example, if `e` and `é` have the same sort value in a given collation, they compare as equal.

The default character set and collation are `utf8mb4` and `utf8mb4_0900_ai_ci`, so nonbinary string comparisons are case-insensitive by default. This means that if you search with `col_name LIKE 'a %'`, you get all column values that start with `A` or `a`. To make this search case-sensitive, make sure that one of the operands has a case-sensitive or binary collation. For example, if you are comparing a column and a string that both have the `utf8mb4` character set, you can use the `COLLATE` operator to cause either operand to have the `utf8mb4_0900_as_ci` or `utf8mb4_bin` collation:

```
col_name COLLATE utf8mb4_0900_as_ci LIKE 'a%'
col_name LIKE 'a%' COLLATE utf8mb4_0900_as_ci
col_name COLLATE utf8mb4_bin LIKE 'a%'
col_name LIKE 'a%' COLLATE utf8mb4_bin
```

If you want a column always to be treated in case-sensitive fashion, declare it with a case-sensitive or binary collation. See [Section 15.1.20, "CREATE TABLE Statement"](#).

To cause a case-sensitive comparison of nonbinary strings to be case-insensitive, use `COLLATE` to name a case-insensitive collation. The strings in the following example normally are case-sensitive, but `COLLATE` changes the comparison to be case-insensitive:

```
mysql> SET NAMES 'utf8mb4';
mysql> SET @s1 = 'MySQL' COLLATE utf8mb4_bin,
 @s2 = 'mysql' COLLATE utf8mb4_bin;
mysql> SELECT @s1 = @s2;
+-----+
| @s1 = @s2 |
+-----+
| 0 |
+-----+
mysql> SELECT @s1 COLLATE utf8mb4_0900_ai_ci = @s2;
+-----+
| @s1 COLLATE utf8mb4_0900_ai_ci = @s2 |
+-----+
| 1 |
+-----+
```

A binary string is case-sensitive in comparisons. To compare the string as case-insensitive, convert it to a nonbinary string and use `COLLATE` to name a case-insensitive collation:

```
mysql> SET @s = BINARY 'MySQL';
mysql> SELECT @s = 'mysql';
+-----+
| @s = 'mysql' |
+-----+
| 0 |
+-----+
mysql> SELECT CONVERT(@s USING utf8mb4) COLLATE utf8mb4_0900_ai_ci = 'mysql';
```

```
+-----+
| CONVERT(@s USING utf8mb4) COLLATE utf8mb4_0900_ai_ci = 'mysql' |
+-----+
| 1 |
+-----+
```

To determine whether a value is compared as a nonbinary or binary string, use the `COLLATION()` function. This example shows that `VERSION()` returns a string that has a case-insensitive collation, so comparisons are case-insensitive:

```
mysql> SELECT COLLATION(VERSION());
+-----+
| COLLATION(VERSION()) |
+-----+
| utf8mb3_general_ci |
+-----+
```

For binary strings, the collation value is `binary`, so comparisons are case sensitive. One context in which you can expect to see `binary` is for compression functions, which return binary strings as a general rule: string:

```
mysql> SELECT COLLATION(COMPRESS('x'));
+-----+
| COLLATION(COMPRESS('x')) |
+-----+
| binary |
+-----+
```

To check the sort value of a string, the `WEIGHT_STRING()` may be helpful. See [Section 14.8, “String Functions and Operators”](#).

### B.3.4.2 Problems Using DATE Columns

The format of a `DATE` value is '`YYYY-MM-DD`'. According to standard SQL, no other format is permitted. You should use this format in `UPDATE` expressions and in the `WHERE` clause of `SELECT` statements. For example:

```
SELECT * FROM t1 WHERE date >= '2003-05-05';
```

As a convenience, MySQL automatically converts a date to a number if the date is used in numeric context and vice versa. MySQL also permits a “relaxed” string format when updating and in a `WHERE` clause that compares a date to a `DATE`, `DATETIME`, or `TIMESTAMP` column. “Relaxed” format means that any punctuation character may be used as the separator between parts. For example, '`2004-08-15`' and '`2004#08#15`' are equivalent. MySQL can also convert a string containing no separators (such as '`20040815`'), provided it makes sense as a date.

When you compare a `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` to a constant string with the `<`, `<=`, `=`, `>`, or `BETWEEN` operators, MySQL normally converts the string to an internal long integer for faster comparison (and also for a bit more “relaxed” string checking). However, this conversion is subject to the following exceptions:

- When you compare two columns
- When you compare a `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` column to an expression
- When you use any comparison method other than those just listed, such as `IN` or `STRCMP()`.

For those exceptions, the comparison is done by converting the objects to strings and performing a string comparison.

To be on the safe side, assume that strings are compared as strings and use the appropriate string functions if you want to compare a temporal value to a string.

The special “zero” date '`0000-00-00`' can be stored and retrieved as '`0000-00-00`'. When a '`0000-00-00`' date is used through Connector/ODBC, it is automatically converted to `NULL` because ODBC cannot handle that kind of date.

Because MySQL performs the conversions just described, the following statements work (assume that `idate` is a `DATE` column):

```
INSERT INTO t1 (idate) VALUES ('19970505');
INSERT INTO t1 (idate) VALUES ('19970505');
INSERT INTO t1 (idate) VALUES ('97-05-05');
INSERT INTO t1 (idate) VALUES ('1997.05.05');
INSERT INTO t1 (idate) VALUES ('1997 05 05');
INSERT INTO t1 (idate) VALUES ('0000-00-00');

SELECT idate FROM t1 WHERE idate >= '1997-05-05';
SELECT idate FROM t1 WHERE idate >= 19970505;
SELECT MOD(idate,100) FROM t1 WHERE idate >= 19970505;
SELECT idate FROM t1 WHERE idate >= '19970505';
```

However, the following statement does not work:

```
SELECT idate FROM t1 WHERE STRCMP(idate,'20030505')=0;
```

`STRCMP()` is a string function, so it converts `idate` to a string in '`YYYY-MM-DD`' format and performs a string comparison. It does not convert '`20030505`' to the date '`2003-05-05`' and perform a date comparison.

If you enable the `ALLOW_INVALID_DATES` SQL mode, MySQL permits you to store dates that are given only limited checking: MySQL requires only that the day is in the range from 1 to 31 and the month is in the range from 1 to 12. This makes MySQL very convenient for Web applications where you obtain year, month, and day in three different fields and you want to store exactly what the user inserted (without date validation).

MySQL permits you to store dates where the day or month and day are zero. This is convenient if you want to store a birthdate in a `DATE` column and you know only part of the date. To disallow zero month or day parts in dates, enable the `NO_ZERO_IN_DATE` mode.

MySQL permits you to store a “zero” value of '`0000-00-00`' as a “dummy date.” This is in some cases more convenient than using `NULL` values. If a date to be stored in a `DATE` column cannot be converted to any reasonable value, MySQL stores '`0000-00-00`'. To disallow '`0000-00-00`', enable the `NO_ZERO_DATE` mode.

To have MySQL check all dates and accept only legal dates (unless overridden by `IGNORE`), set the `sql_mode` system variable to "`NO_ZERO_IN_DATE,NO_ZERO_DATE`".

### B.3.4.3 Problems with NULL Values

The concept of the `NULL` value is a common source of confusion for newcomers to SQL, who often think that `NULL` is the same thing as an empty string '`''`'. This is not the case. For example, the following statements are completely different:

```
mysql> INSERT INTO my_table (phone) VALUES (NULL);
mysql> INSERT INTO my_table (phone) VALUES ('');
```

Both statements insert a value into the `phone` column, but the first inserts a `NULL` value and the second inserts an empty string. The meaning of the first can be regarded as “phone number is not known” and the meaning of the second can be regarded as “the person is known to have no phone, and thus no phone number.”

To help with `NULL` handling, you can use the `IS NULL` and `IS NOT NULL` operators and the `IFNULL()` function.

In SQL, the `NULL` value is never true in comparison to any other value, even `NULL`. An expression that contains `NULL` always produces a `NULL` value unless otherwise indicated in the documentation for the operators and functions involved in the expression. All columns in the following example return `NULL`:

```
mysql> SELECT NULL, 1+NULL, CONCAT('Invisible',NULL);
```

To search for column values that are `NULL`, you cannot use an `expr = NULL` test. The following statement returns no rows, because `expr = NULL` is never true for any expression:

```
mysql> SELECT * FROM my_table WHERE phone = NULL;
```

To look for `NULL` values, you must use the `IS NULL` test. The following statements show how to find the `NULL` phone number and the empty phone number:

```
mysql> SELECT * FROM my_table WHERE phone IS NULL;
mysql> SELECT * FROM my_table WHERE phone = '';
```

See [Section 5.3.4.6, “Working with NULL Values”](#), for additional information and examples.

You can add an index on a column that can have `NULL` values if you are using the `MyISAM`, `InnoDB`, or `MEMORY` storage engine. Otherwise, you must declare an indexed column `NOT NULL`, and you cannot insert `NULL` into the column.

When reading data with `LOAD DATA`, empty or missing columns are updated with `' '`. To load a `NULL` value into a column, use `\N` in the data file. The literal word `NULL` may also be used under some circumstances. See [Section 15.2.9, “LOAD DATA Statement”](#).

When using `DISTINCT`, `GROUP BY`, or `ORDER BY`, all `NULL` values are regarded as equal.

When using `ORDER BY`, `NULL` values are presented first, or last if you specify `DESC` to sort in descending order.

Aggregate (group) functions such as `COUNT()`, `MIN()`, and `SUM()` ignore `NULL` values. The exception to this is `COUNT(*)`, which counts rows and not individual column values. For example, the following statement produces two counts. The first is a count of the number of rows in the table, and the second is a count of the number of non-`NULL` values in the `age` column:

```
mysql> SELECT COUNT(*), COUNT(age) FROM person;
```

For some data types, MySQL handles `NULL` values in special ways. For example, if you insert `NULL` into an integer or floating-point column that has the `AUTO_INCREMENT` attribute, the next number in the sequence is inserted. Under certain conditions, if you insert `NULL` into a `TIMESTAMP` column, the current date and time is inserted; this behavior depends in part on the server SQL mode (see [Section 7.1.11, “Server SQL Modes”](#)) as well as the value of the `explicit_defaults_for_timestamp` system variable.

#### B.3.4.4 Problems with Column Aliases

An alias can be used in a query select list to give a column a different name. You can use the alias in `GROUP BY`, `ORDER BY`, or `HAVING` clauses to refer to the column:

```
SELECT SQRT(a*b) AS root FROM tbl_name
 GROUP BY root HAVING root > 0;
SELECT id, COUNT(*) AS cnt FROM tbl_name
 GROUP BY id HAVING cnt > 0;
SELECT id AS 'Customer identity' FROM tbl_name;
```

Standard SQL disallows references to column aliases in a `WHERE` clause. This restriction is imposed because when the `WHERE` clause is evaluated, the column value may not yet have been determined. For example, the following query is illegal:

```
SELECT id, COUNT(*) AS cnt FROM tbl_name
 WHERE cnt > 0 GROUP BY id;
```

The `WHERE` clause determines which rows should be included in the `GROUP BY` clause, but it refers to the alias of a column value that is not known until after the rows have been selected, and grouped by the `GROUP BY`.

In the select list of a query, a quoted column alias can be specified using identifier or string quoting characters:

```
SELECT 1 AS `one`, 2 AS `two`;
```

Elsewhere in the statement, quoted references to the alias must use identifier quoting or the reference is treated as a string literal. For example, this statement groups by the values in column `id`, referenced using the alias ``a``:

```
SELECT id AS 'a', COUNT(*) AS cnt FROM tbl_name
GROUP BY `a`;
```

This statement groups by the literal string `'a'` and does not work as you may expect:

```
SELECT id AS 'a', COUNT(*) AS cnt FROM tbl_name
GROUP BY 'a';
```

### B.3.4.5 Rollback Failure for Nontransactional Tables

If you receive the following message when trying to perform a `ROLLBACK`, it means that one or more of the tables you used in the transaction do not support transactions:

```
Warning: Some non-transactional changed tables couldn't be rolled back
```

These nontransactional tables are not affected by the `ROLLBACK` statement.

If you were not deliberately mixing transactional and nontransactional tables within the transaction, the most likely cause for this message is that a table you thought was transactional actually is not. This can happen if you try to create a table using a transactional storage engine that is not supported by your `mysqld` server (or that was disabled with a startup option). If `mysqld` does not support a storage engine, it instead creates the table as a `MyISAM` table, which is nontransactional.

You can check the storage engine for a table by using either of these statements:

```
SHOW TABLE STATUS LIKE 'tbl_name';
SHOW CREATE TABLE tbl_name;
```

See [Section 15.7.7.38, “SHOW TABLE STATUS Statement”](#), and [Section 15.7.7.11, “SHOW CREATE TABLE Statement”](#).

To check which storage engines your `mysqld` server supports, use this statement:

```
SHOW ENGINES;
```

See [Section 15.7.7.17, “SHOW ENGINES Statement”](#) for full details.

### B.3.4.6 Deleting Rows from Related Tables

If the total length of the `DELETE` statement for `related_table` is more than the default value of the `max_allowed_packet` system variable, you should split it into smaller parts and execute multiple `DELETE` statements. You probably get the fastest `DELETE` by specifying only 100 to 1,000 `related_column` values per statement if the `related_column` is indexed. If the `related_column` is not indexed, the speed is independent of the number of arguments in the `IN` clause.

### B.3.4.7 Solving Problems with No Matching Rows

If you have a complicated query that uses many tables but that returns no rows, you should use the following procedure to find out what is wrong:

1. Test the query with `EXPLAIN` to check whether you can find something that is obviously wrong. See [Section 15.8.2, “EXPLAIN Statement”](#).
2. Select only those columns that are used in the `WHERE` clause.
3. Remove one table at a time from the query until it returns some rows. If the tables are large, it is a good idea to use `LIMIT 10` with the query.

4. Issue a `SELECT` for the column that should have matched a row against the table that was last removed from the query.
5. If you are comparing `FLOAT` or `DOUBLE` columns with numbers that have decimals, you cannot use equality (`=`) comparisons. This problem is common in most computer languages because not all floating-point values can be stored with exact precision. In some cases, changing the `FLOAT` to a `DOUBLE` fixes this. See [Section B.3.4.8, “Problems with Floating-Point Values”](#).
6. If you still cannot figure out what is wrong, create a minimal test that can be run with `mysql test < query.sql` that shows your problems. You can create a test file by dumping the tables with `mysqldump --quick db_name tbl_name_1 ... tbl_name_n > query.sql`. Open the file in an editor, remove some insert lines (if there are more than needed to demonstrate the problem), and add your `SELECT` statement at the end of the file.

Verify that the test file demonstrates the problem by executing these commands:

```
$> mysqladmin create test2
$> mysql test2 < query.sql
```

Attach the test file to a bug report, which you can file using the instructions in [Section 1.6, “How to Report Bugs or Problems”](#).

### B.3.4.8 Problems with Floating-Point Values

Floating-point numbers sometimes cause confusion because they are approximate and not stored as exact values. A floating-point value as written in an SQL statement may not be the same as the value represented internally. Attempts to treat floating-point values as exact in comparisons may lead to problems. They are also subject to platform or implementation dependencies. The `FLOAT` and `DOUBLE` data types are subject to these issues. For `DECIMAL` columns, MySQL performs operations with a precision of 65 decimal digits, which should solve most common inaccuracy problems.

The following example uses `DOUBLE` to demonstrate how calculations that are done using floating-point operations are subject to floating-point error.

```
mysql> CREATE TABLE t1 (i INT, d1 DOUBLE, d2 DOUBLE);
mysql> INSERT INTO t1 VALUES (1, 101.40, 21.40), (1, -80.00, 0.00),
 -> (2, 0.00, 0.00), (2, -13.20, 0.00), (2, 59.60, 46.40),
 -> (2, 30.40, 30.40), (3, 37.00, 7.40), (3, -29.60, 0.00),
 -> (4, 60.00, 15.40), (4, -10.60, 0.00), (4, -34.00, 0.00),
 -> (5, 33.00, 0.00), (5, -25.80, 0.00), (5, 0.00, 7.20),
 -> (6, 0.00, 0.00), (6, -51.40, 0.00);

mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b
 -> FROM t1 GROUP BY i HAVING a <> b;

+----+----+----+
| i | a | b |
+----+----+----+
| 1 | 21.4 | 21.4 |
| 2 | 76.8 | 76.8 |
| 3 | 7.4 | 7.4 |
| 4 | 15.4 | 15.4 |
| 5 | 7.2 | 7.2 |
| 6 | -51.4 | 0 |
+----+----+----+
```

The result is correct. Although the first five records look like they should not satisfy the comparison (the values of `a` and `b` do not appear to be different), they may do so because the difference between the numbers shows up around the tenth decimal or so, depending on factors such as computer architecture or the compiler version or optimization level. For example, different CPUs may evaluate floating-point numbers differently.

If columns `d1` and `d2` had been defined as `DECIMAL` rather than `DOUBLE`, the result of the `SELECT` query would have contained only one row—the last one shown above.

The correct way to do floating-point number comparison is to first decide on an acceptable tolerance for differences between the numbers and then do the comparison against the tolerance value. For example, if we agree that floating-point numbers should be regarded the same if they are same within a precision of one in ten thousand (0.0001), the comparison should be written to find differences larger than the tolerance value:

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b FROM t1
-> GROUP BY i HAVING ABS(a - b) > 0.0001;
+----+-----+-----+
| i | a | b |
+----+-----+-----+
| 6 | -51.4 | 0 |
+----+-----+
1 row in set (0.00 sec)
```

Conversely, to get rows where the numbers are the same, the test should find differences within the tolerance value:

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b FROM t1
-> GROUP BY i HAVING ABS(a - b) <= 0.0001;
+----+-----+-----+
| i | a | b |
+----+-----+-----+
| 1 | 21.4 | 21.4 |
| 2 | 76.8 | 76.8 |
| 3 | 7.4 | 7.4 |
| 4 | 15.4 | 15.4 |
| 5 | 7.2 | 7.2 |
+----+-----+
5 rows in set (0.03 sec)
```

Floating-point values are subject to platform or implementation dependencies. Suppose that you execute the following statements:

```
CREATE TABLE t1(c1 FLOAT(53,0), c2 FLOAT(53,0));
INSERT INTO t1 VALUES('1e+52','-1e+52');
SELECT * FROM t1;
```

On some platforms, the `SELECT` statement returns `inf` and `-inf`. On others, it returns `0` and `-0`.

An implication of the preceding issues is that if you attempt to create a replica by dumping table contents with `mysqldump` on the source and reloading the dump file into the replica, tables containing floating-point columns might differ between the two hosts.

### B.3.5 Optimizer-Related Issues

MySQL uses a cost-based optimizer to determine the best way to resolve a query. In many cases, MySQL can calculate the best possible query plan, but sometimes MySQL does not have enough information about the data at hand and has to make “educated” guesses about the data.

For the cases when MySQL does not do the “right” thing, tools that you have available to help MySQL are:

- Use the `EXPLAIN` statement to get information about how MySQL processes a query. To use it, just add the keyword `EXPLAIN` to the front of your `SELECT` statement:

```
mysql> EXPLAIN SELECT * FROM t1, t2 WHERE t1.i = t2.i;
```

`EXPLAIN` is discussed in more detail in [Section 15.8.2, “EXPLAIN Statement”](#).

- Use `ANALYZE TABLE tbl_name` to update the key distributions for the scanned table. See [Section 15.7.3.1, “ANALYZE TABLE Statement”](#).
- Use `FORCE INDEX` for the scanned table to tell MySQL that table scans are very expensive compared to using the given index:

```
SELECT * FROM t1, t2 FORCE INDEX (index_for_column)
WHERE t1.col_name=t2.col_name;
```

`USE INDEX` and `IGNORE INDEX` may also be useful. See [Section 10.9.4, “Index Hints”](#).

- Global and table-level `STRAIGHT_JOIN`. See [Section 15.2.13, “SELECT Statement”](#).
- You can tune global or thread-specific system variables. For example, start `mysqld` with the `--max-seeks-for-key=1000` option or use `SET max_seeks_for_key=1000` to tell the optimizer to assume that no key scan causes more than 1,000 key seeks. See [Section 7.1.8, “Server System Variables”](#).

## B.3.6 Table Definition-Related Issues

### B.3.6.1 Problems with ALTER TABLE

If you get a duplicate-key error when using `ALTER TABLE` to change the character set or collation of a character column, the cause is either that the new column collation maps two keys to the same value or that the table is corrupted. In the latter case, you should run `REPAIR TABLE` on the table. `REPAIR TABLE` works for `MyISAM`, `ARCHIVE`, and `CSV` tables.

If you use `ALTER TABLE` on a transactional table or if you are using Windows, `ALTER TABLE` unlocks the table if you had done a `LOCK TABLE` on it. This is done because `InnoDB` and these operating systems cannot drop a table that is in use.

### B.3.6.2 TEMPORARY Table Problems

Temporary tables created with `CREATE TEMPORARY TABLE` have the following limitations:

- `TEMPORARY` tables are supported only by the `InnoDB`, `MEMORY`, `MyISAM`, and `MERGE` storage engines.
- Temporary tables are not supported for NDB Cluster.
- The `SHOW TABLES` statement does not list `TEMPORARY` tables.
- To rename `TEMPORARY` tables, `RENAME TABLE` does not work. Use `ALTER TABLE` instead:

```
ALTER TABLE old_name RENAME new_name;
```

- You cannot refer to a `TEMPORARY` table more than once in the same query. For example, the following does not work:

```
SELECT * FROM temp_table JOIN temp_table AS t2;
```

The statement produces this error:

```
ERROR 1137: Can't reopen table: 'temp_table'
```

You can work around this issue if your query permits use of a common table expression (CTE) rather than a `TEMPORARY` table. For example, this fails with the `Can't reopen table` error:

```
CREATE TEMPORARY TABLE t SELECT 1 AS col_a, 2 AS col_b;
SELECT * FROM t AS t1 JOIN t AS t2;
```

To avoid the error, use a `WITH` clause that defines a CTE, rather than the `TEMPORARY` table:

```
WITH cte AS (SELECT 1 AS col_a, 2 AS col_b)
SELECT * FROM cte AS t1 JOIN cte AS t2;
```

- The `Can't reopen table` error also occurs if you refer to a temporary table multiple times in a stored function under different aliases, even if the references occur in different statements within the

function. It may occur for temporary tables created outside stored functions and referred to across multiple calling and callee functions.

- If a `TEMPORARY` is created with the same name as an existing non-`TEMPORARY` table, the non-`TEMPORARY` table is hidden until the `TEMPORARY` table is dropped, even if the tables use different storage engines.
- There are known issues in using temporary tables with replication. See [Section 19.5.1.31, “Replication and Temporary Tables”](#), for more information.

## B.3.7 Known Issues in MySQL

This section lists known issues in recent versions of MySQL.

For information about platform-specific issues, see the installation and debugging instructions in [Section 2.1, “General Installation Guidance”](#), and [Section 7.9, “Debugging MySQL”](#).

The following problems are known:

- Subquery optimization for `IN` is not as effective as for `=`.
- Even if you use `lower_case_table_names=2` (which enables MySQL to remember the case used for databases and table names), MySQL does not remember the case used for database names for the function `DATABASE()` or within the various logs (on case-insensitive systems).
- Dropping a `FOREIGN KEY` constraint does not work in replication because the constraint may have another name on the replica.
- `REPLACE` (and `LOAD DATA` with the `REPLACE` option) does not trigger `ON DELETE CASCADE`.
- `DISTINCT` with `ORDER BY` does not work inside `GROUP_CONCAT()` if you do not use all and only those columns that are in the `DISTINCT` list.
- When inserting a big integer value (between  $2^{63}$  and  $2^{64}-1$ ) into a decimal or string column, it is inserted as a negative value because the number is evaluated in signed integer context.
- With statement-based binary logging, the source server writes the executed queries to the binary log. This is a very fast, compact, and efficient logging method that works perfectly in most cases. However, it is possible for the data on the source and replica to become different if a query is designed in such a way that the data modification is nondeterministic (generally not a recommended practice, even outside of replication).

For example:

- `CREATE TABLE ... SELECT` or `INSERT ... SELECT` statements that insert zero or `NULL` values into an `AUTO_INCREMENT` column.
- `DELETE` if you are deleting rows from a table that has foreign keys with `ON DELETE CASCADE` properties.
- `REPLACE ... SELECT, INSERT IGNORE ... SELECT` if you have duplicate key values in the inserted data.

**If and only if the preceding queries have no `ORDER BY` clause guaranteeing a deterministic order.**

For example, for `INSERT ... SELECT` with no `ORDER BY`, the `SELECT` may return rows in a different order (which results in a row having different ranks, hence getting a different number in the `AUTO_INCREMENT` column), depending on the choices made by the optimizers on the source and replica.

A query is optimized differently on the source and replica only if:

- The table is stored using a different storage engine on the source than on the replica. (It is possible to use different storage engines on the source and replica. For example, you can use `InnoDB` on the source, but `MyISAM` on the replica if the replica has less available disk space.)
- MySQL buffer sizes (`key_buffer_size`, and so on) are different on the source and replica.
- The source and replica run different MySQL versions, and the optimizer code differs between these versions.

This problem may also affect database restoration using `mysqlbinlog | mysql`.

The easiest way to avoid this problem is to add an `ORDER BY` clause to the aforementioned nondeterministic queries to ensure that the rows are always stored or modified in the same order. Using row-based or mixed logging format also avoids the problem.

- Log file names are based on the server host name if you do not specify a file name with the startup option. To retain the same log file names if you change your host name to something else, you must explicitly use options such as `--log-bin=old_host_name-bin`. See [Section 7.1.7, “Server Command Options”](#). Alternatively, rename the old files to reflect your host name change. If these are binary logs, you must edit the binary log index file and fix the binary log file names there as well. (The same is true for the relay logs on a replica.)
- `mysqlbinlog` does not delete temporary files left after a `LOAD DATA` statement. See [Section 6.6.9, “mysqlbinlog — Utility for Processing Binary Log Files”](#).
- `RENAME` does not work with `TEMPORARY` tables or tables used in a `MERGE` table.
- When using `SET CHARACTER SET`, you cannot use translated characters in database, table, and column names.
- The server uses only the first `max_sort_length` bytes when comparing data values. This means that values cannot reliably be used in `GROUP BY`, `ORDER BY`, or `DISTINCT` if they differ only after the first `max_sort_length` bytes. To work around this, increase the variable value. The default value of `max_sort_length` is 1024 and can be changed at server startup time or at runtime.
- Numeric calculations are done with `BIGINT` or `DOUBLE` (both are normally 64 bits long). Which precision you get depends on the function. The general rule is that bit functions are performed with `BIGINT` precision, `IF()` and `ELT()` with `BIGINT` or `DOUBLE` precision, and the rest with `DOUBLE` precision. You should try to avoid using unsigned long long values if they resolve to be larger than 63 bits (9223372036854775807) for anything other than bit fields.
- You can have up to 255 `ENUM` and `SET` columns in one table.
- In `MIN()`, `MAX()`, and other aggregate functions, MySQL currently compares `ENUM` and `SET` columns by their string value rather than by the string's relative position in the set.
- In an `UPDATE` statement, columns are updated from left to right. If you refer to an updated column, you get the updated value instead of the original value. For example, the following statement increments `KEY` by 2, **not 1**:

```
mysql> UPDATE tbl_name SET KEY=KEY+1,KEY=KEY+1;
```

- You can refer to multiple temporary tables in the same query, but you cannot refer to any given temporary table more than once. For example, the following does not work:

```
mysql> SELECT * FROM temp_table, temp_table AS t2;
ERROR 1137: Can't reopen table: 'temp_table'
```

- The optimizer may handle `DISTINCT` differently when you are using “hidden” columns in a join than when you are not. In a join, hidden columns are counted as part of the result (even if they are not shown), whereas in normal queries, hidden columns do not participate in the `DISTINCT` comparison.

An example of this is:

```
SELECT DISTINCT mp3id FROM band_downloads
 WHERE userid = 9 ORDER BY id DESC;
```

and

```
SELECT DISTINCT band_downloads.mp3id
 FROM band_downloads,band_mp3
 WHERE band_downloads.userid = 9
 AND band_mp3.id = band_downloads.mp3id
 ORDER BY band_downloads.id DESC;
```

In the second case, you may get two identical rows in the result set (because the values in the hidden `id` column may differ).

Note that this happens only for queries that do not have the `ORDER BY` columns in the result.

- If you execute a `PROCEDURE` on a query that returns an empty set, in some cases the `PROCEDURE` does not transform the columns.
- Creation of a table of type `MERGE` does not check whether the underlying tables are compatible types.
- If you use `ALTER TABLE` to add a `UNIQUE` index to a table used in a `MERGE` table and then add a normal index on the `MERGE` table, the key order is different for the tables if there was an old, non-`UNIQUE` key in the table. This is because `ALTER TABLE` puts `UNIQUE` indexes before normal indexes to be able to detect duplicate keys as early as possible.
- An `UPDATE` statement involving a temporary table with a join on a non-temporary table having a trigger defined on it can result in an error, even though the update statement reads only the non-temporary table, in the following cases:
  - With read-only mode enabled (by using `SET GLOBAL read_only = 1`).
  - With the transaction level set to `READ_ONLY` (that is, using `SET GLOBAL TRANSACTION READ ONLY` or `SET SESSION TRANSACTION READ ONLY`).
